Pottery was being made, crudely admittedly, at the time of the Emperor Jimmu, the first Emperor of Japan, who lived about 650 B.C. At the time of the Emperor Suinin, that is, 66 A.D., a Korean prince was nationalized, and one of his retainers, who knew the potter's art, was able to give instruction on foreign manufacturing methods. Later, at the time of the Emperor Kammu, i.e., 781 A.D., pottery was imported from China, and the art made further progress.

In 1221 A.D., a man named Kagemasa Kato studied the art of pottery making in China. When he returned, he settled in Seto village, Aichi prefecture, and made chinaware of superior quality, the origin of the present "Seto" ware.

After that, many master artisans arose and tea-things, rice bowls, pitchers, incense burners, etc., now of great rarity and value were produced.

Present Condition of the Industry

In 1937 total production of chinaware amounted to ¥115,191,376, while there were as many as 6,566 factories and 62,231 employees. The value of total production including tiles and drainage pipes reached ¥145,612,876.

The following table shows how this industry has developed recently.

FACTORIES AND PRODUCTION OF CERAMICS

(Compiled by the Ministry of Commerce and Industry)

Year	Factories	Operatives	Tablewares	Furnitures	Building Materials	Insulators	Toys	Others	Total
					(Value in yen)

Exports of Chinaware Though exports of chinaware amounting to ¥1,300,000 were made as early as 1886, the exports business did not develop to any great extent until the Russo-Japanese War. In 1904, the Nippon Toki Kaisha, Ltd., was organized, to be quickly followed by the Toyo Toki Kaisha, Ltd., and the Nagoya Seito-sho. Each of these companies established large mills with up-to-date equipment and began to produce chinaware on a big scale. Painstaking studies were made to improve the products and build up an export business, and these, together with other special factors, account for the remarkably large increase in exports. The special factors are :

(1) Japan is able to produce specially thin chinaware that other countries cannot.

(2) Japanese artisans are especially clever at their work.

(3) The cost of production is reasonable.

Just at the time when the industry was organized on a modern basis, the World War broke out. Pottery works in belligerent countries in Europe were closed down and exports from Japan increased by leaps and bounds. A temporary set-back was experienced when the War ceased, but a recovery was soon made and there was a steady growth until 1929, then there was a falling off until 1932, when some slight gain was made over the previous year. Exports in 1938 declined on account of the State control of trade.

EXPORTS OF CHINAWARE TO DIFFERENT COUNTRIES

(In ¥1,000)

Domestic Consumption There are no statistics to rely upon for the exact amount of domestic consumption, but if we subtract exports from the total production we have an approximate value. Figures shown in the second column of the first table "Factories and Production of Ceramics" give some idea of the amount. Though tile making is growing fast on account of the increase in building of Western style houses, the market had been depressed because of lack of control over production and sales until 1934 when it began to regain prosperity.

The peculiarity about chinaware intended for domestic use is that it must be made by small factories on the family basis. The reason is that the taste of the Japanese for chinaware is very varied, differing according to each individual as to the form, colour, design, etc., and making it impossible to produce on large scale mass production principles.

Glass and Glass Manufactures

Origin and Development

As far as historical record shows, the art of glass manufacturing was developed in the Nara period, that is about 700 A.D. Later, technics of manufactur-

Digitized by Google

ing were imported both from the South Sea Islands and China, and put into practice in Osaka, Kyoto and Tokyo, where the industry developed. After the Meiji Restoration, the Government established a model factory to encourage the development of the industry and various attempts were afterwards made to make glass and glassware both by the Government and by individual concerns, but it was not until after the Russo-Japanese War of 1904–1905, that the industry made any great progress.

Present Condition

Due to the strenuous efforts of manufacturers and advantages from a low exchange rate since the gold embargo was replaced, the glass industry in Japan is doing remarkably well.

Glass Tableware Glass tableware was early manufactured in Kagoshima and the old province of Satsuma in Kyushu Island. After the Meiji Restoration it was manufactured by the Shinagawa Shoshi Seizosho (Shinagawa Glass Co.) which was under Government control. At present it is manufactured by the Fukushima Glass Co. organized in 1896, Koidé Shoshi Seizosho (Koidé Glass Co.) established in 1898, Marasa Glass Co., organized in 1918, and the Kawai Shoshi Shokki Seizosho (Kawai Table Glassware Co.) organized in 1920, etc. Production by these and other manufacturers is given below

Other Glass Articles Glass articles for scientific and medical purposes were manufactured as early as 1850. There are many manufacturers of these articles in Tokyo district.

The manufacturing of eye-glasses was first practised as early as 1600. In 1873, a certain Mr. Matsugoro Asakura from Tokyo, went to Austria and learned the art of manufacturing eye-glasses on modern principles. His son and several others are now manufacturing them.

Red glass was manufactured by the Kagoshima clan prior to the Meiji Restoration, and later by the Shinagawa Shoshi Seizosho, which was under Government control. Also a certain Mr. Tokijiro Iwashiro succeeded in manufacturing lenses for the use of searchlights, and light-houses. The right of manufacturing these lenses was later transferred to the Nippon Kogaku Kogyo Kaisha, Ltd., (The Nippon Optical Science Industrial Co., Ltd.). Mr. Iwashiro's son later succeeded in manufacturing cut glass.

Glasses for optical work were mostly imported from Germany before the World War, but when the supply was cut off by the war, it was determined that "lenses for optical science must be produced at home at any cost." The Nippon Kogaku Kogyo Kaisha, Ltd., to which all the results of studies made by the naval arsenal were transferred in 1914, and the Osaka Industrial Research Institute, which started research work in 1921, continued investigations. The Osaka Institute succeeded in 1925 in discovering a formula for manufacturing lenses, superior to German makes at reasonable cost. The Nippon Kogaku Kogyo Kaisha, Ltd., also succeeded in finding a way to make these lenses, and it is probable that the importation of lenses of these classes from Germany will, in a not distant future, become unnecessary.

Glasses for the chemical industry, that is, hard glasses, are manufactured in several mills in Japan. High grade hard glass which is not in any degree inferior to the best imported is now manufactured by several firms for thermometers, gauges and the chemical industry.

Sheet Glass

Though many efforts were previously made to manufacture sheet glass, it was not until 1904 that a Mr. Magoichi Shimoda, after two years of experimental manufacture, was successful in producing a product that could be put on the market.

In 1907, the Asahi Glass Co., Ltd., was organized in Amagasaki, Hyogo prefecture, by the family of the late Baron Yanosuké Iwasaki. An export and five skilled workmen were brought over from Belgium and commenced to manufacture it from 1909. The company struggled for 7 years against difficulties in technique and pressure of foreign competition, and in the end succeeded in producing about 120,000 cases a year. In 1914, a patent, which enabled the company to produce sheet glass by a mechanical process was bought from the American Window Glass Co., Ltd., and a factory was established at Makiyama in Tobata, Fukuoka prefecture. On account of the cutting off of imports from Europe during the World War, the company not only increased production, but exported their products to places far afield as South Africa and London. In 1916, the company established a factory in Tsurumi, Yokohama, and in 1917 another in Yawata, Fukuoka prefecture. In 1923 and 1924, the factories in Makiyama and Tsurumi were extended, and at present the company is capitalized at ¥40,000,000 and has a productive capacity of 545,000,000 sq. feet, besides soda products, culcium chloride, fire

Digitized by Google

brick and corhart electrocast-brick. Its head office is now at Marunouchi, Tokyo.

At present the Asahi Glass Co. Ltd., the Nippon Sheet Glass Co. Ltd., the Nippon Thick Glass Co. Ltd., and the Tokunaga Sheet Glass Co. Ltd. are manufacturing sheet glasses.

Matches

The Industry in the Past

A factory for making matches was first established in Japan, in Tokyo, in April, 1875, by a certain Mr. Makoto Shimizu, who had just returned from studying the subject in a French technical school and a match factory managed by the French Government. In the same year a factory was established in Osaka, and in 1877 another was established in Kobé. In 1878, three years after the first factory was established, matches to the value of ¥24,000 were exported, and in succession factories were established in Shizuoka, Aichi, Osaka and Hyogo prefectures. By 1889, not only had the importation of matches ceased, but large quantities, in face of strong foreign competition, were being exported to China. In 1887, Hyōgo-ken Match Seizogyo Kumiai (Association of Manufacturers of Matches in Hyogo prefecture) was formed and in 1900 the Dogyo Kumiai (Association of Traders in Matches) was organized. The industry experienced great prosperity during the Russo-Japanese War, exports were made not only to China but also to the South Sea Islands, Straits Settlements and India. But from about that time the match industry began to develop in China and by 1908 it had developed to the extent that the market in China was considerably curtailed for the Japanese product, then when India raised her tariff on matches, and the Dutch East Indies imposed a consumption tax on them, exports of matches to countries in the Orient were considerably reduced. Exports for some time became almost negligibly small but in 1933, they suddenly increased to ¥3,248,000 from about ¥938,000 in 1932.

The development of the match industry during the World War was such as to make the industry a menace to the International Match Company. This company, therefore, commenced nagotiations with and was successful in amal-

Digitized by Google

gamating the Nippon Match Manufacturing Co., Ltd., which was one of the Mitsui interests, and the Nippon Match Co. came under foreign management for three years, that is, until 1927, when the largest match manufacturer in Japan, the Toyo Match Co., Ltd., seeing the advantages which would accrue from co-operation with the International Match Company agreed to amalgamation. The Daido Match Co., Ltd. (The Great Consolidated Match Co., Ltd.) was organized with capital equally subscribed by Japan and Sweden, and the management was placed in Japanese hands, avoiding in this way competition in foreign markets.

Exports increased along with the development of the industry and as far back as 1913 Japan's match exports totalled some ¥12,000,000 after meeting the domestic demand. During the World War annual exports were between ¥30,000,000 and ¥40,000,000, forming one of the big ten export items of Japan.

Due to the rising importance of Soviet matches in international trade, Japan's shipments to the United States have fallen almost to the vanishing point. At one time Japanese matches were most active in this trade, outstripping Soviet and Swedish matches in American sales. In the spring of 1935, however, a match sales agreement was concluded in New York, covering the American market. Each group agreed to take an annual quota of 33,000 tons.

In spite of the agreement, the situation has developed adversely for the Japanese and the trade is facing ruin. In anticipation of the conclusion of the agreement, the Soviet Union shipped vast quantities of its matches to America and since then has been underselling all competitors.

Japanese efforts to combat this tendency have been fruitless. The Goto Match Importing Company which the Japanese exporters established in New York to handle that end of the business has not been able to check the Soviet advance, for it has been trying to get large profits on each unit, rather than meeting the Soviet price. Shipments have fallen away to nothing and the exporters here are likely to repudiate the agreement and ship directly in the future unless something is done.

When the Japanese match industry was influenced by Swedish interests the export field was limited to China and part of the South Seas. America, Australia, the Near East, Africa and Europe was monopolized by Swedish interests. After Kreuger's downfall Japanese match exporters took back their old markets. With the replacement of the gold embargo Japanese products have found their way in heavy volume to their old markets. The low exchange rate and cheap labour in Japan have stimulated exports.

Exports in 1937 and 1938 follow:

EXPORTS OF MATCHES

(Value in yen)

Destinations	1937	1938
China	9,000	2,053,000
Philippines	86,000	141,000
Kwantung L. T.	423,000	638,000
Total including others	2,103,000	3,304,000

Number of Factories The number of match factories in Japan was 158 with 8,520 operatives at the end of 1937.

Production of matches and allied articles in recent years has been as follows:

PRODUCTION OF MATCHES, ETC.

Year	Quantity Produced Gross	Value (In yen)	Match-boxes (Value in yen)	Matchwood (Value in yen)
1929	21,607,683	9,825,495	1,358,616	1,220,148

Lacquer-ware

Historical and General Industry Inherent The Japanese are a people skilled in handiwork. Prior to the introduction of modern productive industries from the West in the early

Digitized by Google

years of Meiji, the Japanese were separated from Occidental civilization and culture and the various handicraft industries that had come down from ancient times were in a flourishing condition and in a state of development peculiar to the country. The industries especially referred to are the silk, porcelain, earthen-ware, lacquer-ware, cloisonné-ware, gold lacquer-ware and the metal engraving.

The lacquer-ware industry existed in ancient times. As was the case with the ceramic industry, it progressed with the introduction of Buddhism and of advanced methods from China, but did not make so notable a development as in the case of the textile, ceramic or other industries. With the rise to favour of the tea ceremony in the Ashikaga Age, Kyoto monopolized the production of lacquer-ware, although wares of nearly the same kind, such as "Wajimanuri" and "Shunkeinuri" were produced in fairly large quantities in different places and were largely used for table-ware. After the Restoration of Meiji there was a considerable decline in the demand for such wares as "Noshironuri," "Wakanuri" and "Tsugarunuri" which had been popular in the Tokugawa Period, while the output of "Wajimanuri," "Kurodenuri," and "Imazumuri" which had principally been used as table-ware greatly increased as they were being exported in increasingly large quantities.

Urushi Obtainable Only in the Orient Japan is the only country in the world enjoying world-wide renown in the technical art of lacquer-ware manufacture. The various industrial arts of Japan such as the porcelanic and weaving owe their origin to China or Western countries, but as regards lacquer, Japan acknowledges no teacher; from remote antiquity, especially in the technique of relief lacquer the art has developed without aid from any foreign methods of manufacture or materials. For more than two thousand years the craftsmen of Japan, having striven to improve, finally attained a degree of wonderful skill. The production of lacquer-ware is confined to Oriental countries where only lacquer juice, known as urushi, is obtainable—Japan, China, Korea and India,—although there is an evident tendency in Western countries in recent years to manufacture lacquer-ware of industrial art value. The application of mother of pearl, known as nacre work, became common during the Nara Age. A large number of ancient examples of lacquer-ware that have served as models for succeeding generations are still kept in the Shosoin, the Imperial Treasure House in Nara. These represent products of the Tempyo period, when even large wooden buildings were lacquered. Among such buildings left standing are the Chuson Temple in Iwaté prefecture and the Byodoin Temple in Kyoto prefecture. Embossed lacqerware was invented during the Kamakura Age, when tasteful designs of chrysanthemums and other flowers were in vogue.

From Toyotomi Downward A golden mother of pearl inkstone case in embossed lacquer with a chrysanthemum design is now treasured in the Hachiman Shrine at Kamakura. The pomp and glory of the third Ashikaga Shogun stimulated the art and resulted in the perfecting of embossed lacquer work and the extension of its application to articles of daily necessity. Hideyoshi Toyotomi accomplished his gigantic task of pacifying the country. Grandeur was a unique feature of his administrative policy and social and other life in those days. The grand Momoyama style, named after his palace, was reflected on the industrial arts. Koetsu relief lacquer was supreme and Kodaiji relief lacquer was also produced, representative lacquer products of those days. When the third Tokugawa Shogun, Iyémitsu, came into power, he erected the great Nikko mausoleum and Zojoji Temple at Shiba, Tokyo for his grandfather and father respectively, and lacquer was amply applied to these buildings. During the reign of the fifth Shogun, Tsunayoshi, an exquisite technique attained its zenith, defying all the imitative powers of succeeding generations. It was applied to scabbards of swords, miniature medicine-cases (known as inro) and various articles used by the Daimyo. Notable lacquerers such as Koami Choju, Koma Ikyu, Ogata Korin and others flourihed during this period. Since that time the production of lacquer has spread to various localities throughout the country, and unique local colour has been freely introduced into the design. Competition ensued as in all industrial articles, and some of the products of those days were exported abroad. Japanese industrial arts were almost wholly neglected during several years following the Meiji Restoration. Lacquered articles of artistic value were sold at ridiculously low prices and these were purchased by foreigners who had eyes for their value and who took them to their own countries. This provided an opportunity to introduce the Japanese lacquer art to

Digitized by Google

foreign countries, but at the same time Japan lost many articles of both æthetic and monetary value.

Its Fine Quality A French steamer was wrecked off Izu while outward bound from Japan laden with Japanese lacquer-ware that was to be exhibited at the Vienna International Exposition in 1873. The cargo was salvaged 18 months after the accident and the lacquer goods were found to be undamaged. On slight polishing they regained their former lustre and thus displayed the intrinsic value of this national art product. When the news of this salvaging and condition of the goods became known abroad the export trade took a sudden spurt forward, but there were traders who exported goods of poor quality, and did great damage to the credit and value of Japanese products in the eyes of foreign customers. Apart from defects in manufacture, some of the bad reputation which exported Japanese lacquer-ware has gained, is ascribed to the fact that some manufacturers are producing inferior articles on account of having been forced by exporters to lower prices, but of late years efforts have been made by the authorities concerned to remedy these evils.

How the Ware is Made

Lacquer Juice Lacquer juice forms the main material of the craftsmen. It is obtained from the lacquer (urushi) tree grown in Oriental countries and is a milky juice with a greyish-white colour. In air it undergoes an oxidizing process, becomes brown and finally solidifies. When solidified, it is not soluble in ordinary solvents and has an unusual resistance to acids. Its beautiful appearance and smooth feel defy paint and varnish. Lacquer juice is regarded as a botanical excretion and in normal conditions is stored in a fixed position in the tree. The tree is tapped by making a horizontal, slanting or V-shaped incision of 10 centimetres right to the sap, and from this the greyish-white juice oozes. Attempts have been made to obtain the juice by means of pressing the bark and leaves of the tree, or by using alcohol, but without success. The greyish-white product is called raw lacquer and is used for the initial application to the goods to be lacquered. As material for the finishing applications and colour lacquering the water is extracted from the juice, and various refining processes follow according to the result required. The chief ingredients of raw lacquer are Urshiol, 77.63%, gummy substance, 2.62%, carbonic substance 1.94% and water 17.81%.

Manufacturing Process Lacquer-ware manufacturing is divided into three stages, namely, the initial application, lacquering and relief lacquering. The process is further divided into different categories according to technical experience and skill. Wood, bamboo, paper, metal and porcelain are used as basic materials for initial lacquer applications. Wood is mostly used throughout the country, but wood has the drawback of swelling and contracting according to weather condition. Bamboo and paper are used for particular lacquer-ware making, while metal and porcelain are less commonly used. The initial application is made on the surface of the ware by means of a spatula or brush, the article is thus made water-proof and the absorption of lacquer applied to finish or fill in tiny holes or other defects is prevented. The fininshing process is of course for the purpose of making the ware solid and smooth.

Lacquer is the best material for the initial application, though shibu-varnishing or glue-varnishing is also practised, especially for low grade wares. The juice of the astringent persimmon is the chief substance of shibu, and with this is mixed powdered charcoal or other materials. Glue is also used as a raw material, but it is not much good for solidity. Glue-varnished wares are made mostly for export, and the bad reputation that modern Japanese lacquer-ware has in foreign markets is chiefly ascribed to these glue-varnished articles. Formalin is used to solidify these wares. As regards the finishing application, a proper amount of pigment is added to refined lacquer to make it coloured or transparent, and this is finely applied to wares that have been through the initial application. These are then kept in a wooden closet to avoid dust and allowed to dry. This is called fresh lacquering. When wares are dry, they are polished by charcoal.

Relief lacquering was evolved to give beautiful designs to wares after the finishing application had been gone through. Pictures or designs are painted on the articles by lacquer and before the lacquer is dry, gold, silver and other metallic dust or pigment is applied. Then polishing for the finishing touches takes place. This is called ordinary relief lacquering, but there are other methods of production and prices differ according to the extent of finish. Of the two principal methods of manufacturing high-class goods, polished re-

Digitized by Google

lief lacquering is one. When the ordinary relief lacquering process is completed, lacquer is once more applied to all the surface and the whole is then polished by charcoal, and the design is presented on the surface. The other is embossed relief lacquering, and this requires much time and skill. Designs are made in high relief and the ordinary relief lacquer is applied. Shells, corals, jewels and stones are often inlaid in lacquer-ware and to these are applied transparent or block lacquer, the product being known as aventurine-ground lacquer-ware. Gold dust is also applied in relief and this is known as flush painting. Another unique lacquering is the application of coloured lacquer coatings for as many as a hundred times, and when dry an exquisite design is carved on the ware. This process somewhat differs from relief lacquering but it forms one of those elaborate methods in the manufacture of the lacquer-ware which remains one of the outstanding products of the Japanese craftsman.

Production

Production of lacquer-ware in recent years was as follows. The main cause of the decrease in exports in 1938 was the State control of trade.

FACTORIES AND PRODUCTION OF LACQUER-WARE

	Factories	Operatives	Tableware	Furnitures	Others	Total
			(In yen)			
1929	10,350	30,078	26,004,026	8,249,723	9,613,183	33,866,882

CHAPTER XXIV

COMMUNICATIONS

General

The communications of the country are supervised by the Minister of Communications and a special account is established for the management of this business, beginning with the fiscal year 1934-1935. General condition of the business in Japan proper in 1937-38 may be obtained from the following :

Post, telegraph and telephone officials and operatives (Sept. 30. 1938)	21,577
Post, telegraph and telephone offices (Sept. 30, 1938)	14,830
Ordinary mail routes (March. 31, 1938) in km.	156,616
Ordinary mails accepted (1937-38)	5,032,459,307
Ordinary mails delivered (1937-38)	4,763,778,174
Parcel post routes (March 31, 1935) in km.	85,385
Parcel accepted (1937-38)	72,614,786
Parcels delivered (1937-38)	80,529,155
Telegraph routes (March 31, 1938) in km.	49,710
Telegraph lines (March 31, 1938) in km.	376,045
Telegraphs despatched (1937-38)	74,064,285
Telegraphs received (1937-38)	78,991,640
Telephone subscribers (Sept. 30, 1938)	981,920
Telephone routes (March 31, 1938) in km.	83,139
Telephone lines (March 31, 1938) in km.	7,620,374
Telephones (March 31, 1935)	935,139
Telephone messages (1937-38)	4,976,322,000
Income from postage and fees (1937-38)	¥374,731,955,738
Business expenditure (1937-38)	¥322,951,846,983

The Postal Service

Historical Survey

The present state postal service system was established in 1871, between Tokyo and Osaka. In August of that year, post offices were opened in Niigata, Hakodaté, Kobé, Nagasaki, and Yokohama. In December a new postal route was established between Tokyo and Nagasaki, connecting the two cities in 7 days and 17 hours. In May, 1872, the postal service between Yokohama and Tokyo was greatly improved by the establishment of five deliveries a day, and by July the service was extended to all the cities and towns of importance throughout the country, except a part of Hokkaido.

Foreign Mail Opens In March, 1872, a foreign mail service was opened at the same time as the establishment of official postal regulations. In those days, foreign mail matter in Japan was handled with the aid of the British, American, and French post offices in Yokohama, Kobé and Nagasaki. Soon after the conclusion of the America-Japan Mail Service Treaty in 1873, the American post offices were withdrawn from this country, and Japan was thus placed on an equal footing with the U.S.A. as regards the mail service between the two countries. In 1877, an arrangement was made with twenty-five countries participating in the International Mail Service Treaty. Thereupon, the British and the French post offices were also withdrawn from this country.

The post offices were at first classified into five grades, and in March 1886, they were classified into three as at present. In view of the development of telephone and telegraph business, the authorities introduced a revision in the system of the Communications Department in 1903, and divided post offices into post, telegraph, and telephone offices each of them being classified into 1st, 2nd and 3rd, or 1st and 2nd in the case of telephone offices. With the rapid increase in the amount of mail matter and telephone and telegraphic messages, the regulations of the Communications Department as to the number and kind of offices, were extended from time to time, and at present there are offices in warships, steamers, trains, etc., in addition to the network throughout the country.

The air mail service was commenced

Digitized by Google

in 1929 with the establishment of the Japan Air Transport Company in April of the same year.

The Growth The rapid growth of the postal service in the early years is illustrated by the following statistics:

Year	No. of P. O.
1871	180
1872	1,160
1873	1,501
1874	3,245
1882	5,527

Following the introduction of a revision in the postal service regulations in 1883, some of the offices were eliminated, the number being reduced to 4,088 by the end of 1889. But the steady development of postal business necessitated an increasing number of offices as the following figures for Japan proper show:

On March 31 of	No. of P. O.
1930	9,690
1931	9,954
1932	10,208
1933	10,322
1934	10,611
1935	10,891
1936	11,253
1937	11,669
1938	12,138
1939 (30, Sep.)	12,484

Post offices are classified into three grades, namely 1st, 2nd and 3rd, the 1st being, side by side with 2nd and 3rd offices, in such important places as Tokyo, Osaka, and other leading cities. The 2nd and 3rd are in smaller cities, towns and villages throughout the country. Those of the 1st and 2nd grade are government offices, under direct government management. In post offices of the 3rd class, business is conducted on the contract system.

Its Business

In addition to ordinary matters relating to post and telegrams, the post offices in Japan receive taxes on behalf of the various tax authorities and pay pensions, annuities, etc. on behalf of the Treasury. Since 1906, New Year's greeting cards have been handled separately from ordinary mail matter with a view to relieving congestion. Such mail matter is accepted by all post offices from December 15 to 29 for delivery on New Year's day.

Ordinary mail matter is delivered 5 or 6 times daily in Tokyo, Osaka, and Kyoto, and 4 or 5 times in other large cities, where there are 1st class offices. In smaller cities, the 2nd class offices deliver 3 or 4 times a day. In towns and villages where they have 3rd class offices, mail matter is delivered twice a day only. The number of collections is the same as that of delivery in most cases.

The parcel post service was started in 1892, the first arrangement as regards foreign connections being made with Hongkong in 1879. The scope of international service was gradually extended, and covers almost all treaty countries at present.

Statistical Tables The following tables indicate the volume of business, handled by the post offices, and the increase in the amount of their work:

NUMBER OF POST OFFICES (September 30, 1938)

Postal Money Order can hardly be included into the business of communications. It is, however, one of the important lines of business handled by the post office for the convenience of the large mass of people. The number and amount of postal money orders handled during 1937-38 are given below:

POSTAL MONEY ORDERS IN 1937-38
DOMESTIC

Telegraph Service

Telegraph service in Japan was started in August, 1869, but this was for Governmental messages exclusively. Public telegraph service was started in September of the same year between Tokyo and Yokohama. Telegrams in European languages were despatched for the first time in April, 1870. In August of the same year Osaka and Kobé began to exchange telegraph messages. In June, 1871 the laying of the submarine cable between Nagasaki and Shanghai was completed. In February, 1873, aerial lines connected Tokyo and Nagasaki and telegraph service for districts along the lines was opened. In January, 1879, Japan entered the international telegraph association. With revisions of rules and laws in subsequent years the business was started on a fair and steady road of progress. Wireless telegraph service was installed in 1908, and telegraphic picture transmission was undertaken from August, 1930.

Statistics on the telegraph services follow :

Wireless Telegraph Service

The study of wireless telegraphy was begun in Japan in 1896, or one year after the invention of wireless telegraphy by Marquis Marconi. In 1903, an experiment was made between Nagasaki and Taiwan by the Communications Department with satisfactory results.

The First Station In November, 1906, Japan sent her delegation to Berlin to represent her at the First World Conference on Wireless Telegraphy. In May, 1908, the first land wireless telegraph station was established in Choshi, (Chiba prefecture), whilst the first marine wireless telegraph equipment was set up on the Toyo Kisen liner "Tenyo Maru" in the same year. In July, 1908 wireless telegraph stations were established at Ohsézaki in Nagasaki prefecture, Shionomisaki in Wakayama prefecture and Tsunojima in Yamaguchi prefecture. In December, 1908, a wireless telegraph station was established at Otchishi in Hokkaido. At the same time sets were installed on some of our ocean liners. Japan was thus placed on a more or less secure foundation in the sphere of wireless telegraphy.

The circulation of regulations for private wireless telegraph offices in October, 1915, greatly facilitated the healthy growth of the business, and the service was extended to wider areas. It was utilized for steamship communication, and contact was also made with steamers and between ships and land stations, and also between aeroplanes and steamers or stations on land. With the enforcement of a law for the establishment of wireless sets on steamers, the number of stations rapidly increased.

International Communication The extension of wireless communication with other countries started in Japan in 1915, when messages were exchanged between Otchishi station and Petropavlovsk in

Digitized by Google

Kamchatka. In 1916, the Funabashi station succeeded in exchanging messages with Hawaii. In 1920, the Iwaki station was established for handling messages between Japan and America. In 1925, the Government issued a law establishing the Japan Wireless Telegraph Company with a capital of ¥20,000,000, with a view to becoming absolutely independent of foreign telegraph companies, with whose co-operation Japan had been exchanging wireless messages with all other countries, except America, Russia, and China.

The Government transferred to the Company its Iwaki radio plant and the ground at Yosami and Yokkaichi which it was holding with the intention of erecting radio stations for the services with countries in Europe.

The Company was reorganized in March, 1938 and assumed the name of the International Tele-Communications Company, increasing its capital to ¥25,000,000 and absorbing the International Telephone Company.

The Company has, according to the Law, to equip and manage the facilities and then rent them to the Ministry of Communications in consideration of a subsidy. Although many improvements were introduced at considerable outlay over all former installations of Iwaki radio plant by the Company, the advent of short-wave methods compelled it to close the stations upon the completion of its new stations at Oyama and Fukuoka.

The Company's circuits now offer from Nagoya direct communication service with England, France, Germany, Italy, Switzerland, Poland, Holland, Mexico and Brazil; and from Tokyo the circuits reach out to North and South America, Hawaii, the Philippines, French Indo-China, Siam, Dutch Indies, British India, and Syria. The Company has an extensive plan of development which will in future place Japan in direct touch with all the important countries of the world.

The Company now places the following stations in daily twenty-four hour service:

(a) Transmitting station at Oyama, near Tokyo.

Receiving station at Fukuoka, near Tokyo.

(b) Transmitting station at Yosami, near Nagoya.

Receiving station at Yokkaichi, near Nagoya.

Stations (a) are used for direct communication with San Francisco, Buenos Aires, Honolulu, Manila, Saigon, Bangkok, Bandoeng (Java), Bombay and Beirut (Syria); and, stations (b) for direct communication with London, Paris, Berlin, Rome, Geneva and Warsaw.

Number of telegrams dealt with at wireless telegraph offices in the past five years was as follows:

		Domestic	Foreign
1931-32	Despatched	386,989	53,929
	Received	290,559	24,097
1932-33	Despatched	387,368	50,403
	Received	262,587	22,444
1933-34	Despatched	426,705	53,999

Wireless Telephone Service

The first experiment with wireless telephony in Japan was made in 1911 by the Communications Department with very satisfactory results. It was in 1923, however, that the service was opened for public use between Kobé

Digitized by Google

city and steamers in the harbour. In 1926, this service was extended to Moji. The result being satisfactory, the Government decided further to extend the service and in December, 1932, the International Telephone Company, with a capital of ¥10,000,000, was established through the solicitation of the Communications Ministry to build up stations for the use of the Government and private bodies. This was done to facilitate wireless telephone service between Japan and the world, Japan's colonies and ships at sea. The transmitting station of the company is established at Nazaki, Ibaraki prefecture, and the receiving station at Komuro, Saitama prefecture, and these stations are connected each other and with the Tokyo Central Telephone Office by cables. Wireless telephones are now available between Tokyo, Nagoya, Kanazawa, Kobé, Osaka, Kyoto, Yokohama, Toyohashi, Nara, Himéji, Shimonoséki, Fukui, Fukuoka, Yawata, Wakamatsu, Nishinomiya, Amagasaki and Suma. The service has been opened between Formosa and Tokyo, on June 20, 1934. (See p. 616.)

In 1934-35 international wireless telephone service was successively opened between Japan and Manchoukuo, U. S. A., Canada, Mexico, Cuba, Philippines, Dutch East Indies, Sumatra, England, and Germany. The service with other 28 European countries was opened in July, 1935, with China in February, 1936, with Cape Town and Brazil in April, 1936, with Saigon in May, 1936, and with Argentine, Uruguay, Paraguay, French-Indo-China, Siam, and Union of South Africa in 1937.

Rates for the first 3 minutes range from ¥40 to ¥110 for European countries and from ¥54 to ¥95 for the U.S.A., the highest being ¥164 for Paraguay in South America.

Telephotograph Service This service is only available between Tokyo, Osaka and Formosa.

Radio

Radio broadcasting in Japan is under the control of a single organization, the Broadcasting Corporation of Japan, which in turn is supervised by the Ministry of Communications. Programmes are subjected to strict censorship and nothing that might harm the interests of the country and its people is allowed to go on the air. Advertising of all sorts is prohibited. Political speeches cannot be included in the daily programmes. Even election campaign speeches and Diet proceedings cannot be broadcasted. (See Chapter XXXVII.)

The First Programme The first radio programme in Japan went on the air on March 22, 1925, five years after the world's first regular commercial broadcasting by the station KDKA, East Pittsburgh, Pennsylvania. The station, using the call letters JOAK, was in Tokyo, and it had a power of only 500 watts. This station, established temporarily at Shibaura, on the water front of Tokyo Harbour, was replaced in July by a 1 kw. station at Atagoyama, a hill in the southern part of Tokyo. In the difficult times following the great earthquake and fire of September, 1923, which laid waste a greater part of Tokyo, the radio played an important part in comforting and encouraging the citizens who were working hard to rebuild their city and their homes.

Shortly afterwards, small stations were established in Osaka and Nagoya, which form with Tokyo the three largest population centres. The engineers in charge of these stations were sceptical about their success. There was no assurance that the Japanese public would respond by buying radio sets and listening in, or would like the programmes once they were heard. These fears, however, were groundless. For a time there were not enough receiving sets in the stores to meet the demand. Instead of a novelty, the radio became a daily necessity. Elated at their success, the promoters worked out a plan to centralize all the broadcasting in the country, which was heartily approved by the Ministry of Communications. Before the end of a year, the stations in Tokyo, Osaka and Nagoya were merged, and the Broadcasting Corporation of Japan was formed to assure nationwide cooperation in meeting the demand for more efficient stations and better programmes. The present number of broadcasting stations is 7 with 35 sub-stations.

International Programme Exchange Starting with the vivid scenes of New Year's Eve from U.S.A., the year of 1936 was the busiest year the Corporation ever experienced in the line of international broadcasting.

Digitized by Google

In the early spring, speeches on the London Naval Disarmament Conference by Japanese representatives and the relay of Funeral Service of the late King George V. from England impressed the hearts of whole nation. Besides the large number of programme exchanges with other countries, as one of the chief events previously planned, the Corporation succeeded in relaying eye-witness accounts of almost all events from the actual scene of the Olympic stadium and swimming pool on the occasion of the XIth Olympiad which was held in Berlin.

In order to describe the running commentary of the Olympic Games, the Corporation sent a corps of JOAK staff members to Berlin for the benefit of the domestic listeners.

The entire nation most enthusiastically listened to these broadcasts from Berlin, because of the two-fold events; one of which was Olympic Committee's deliberation in Berlin on the fortunate city for 1940 Olympiad, and the other was the outcome of the Berlin Olympiad itself, awaiting the success of the large number of Japanese competitors participating in the Games. The result of reception was so successful that the whole nation not only enjoyed these broadcasts but marvelled at the technical perfection in the modern art of radio transmission for long distance in which much credit is due to the skill and effort of the operators on both sides.

The international programme exchange yearly adding its importance as one of the most effective mediums to create a better understanding of each nation, the Corporation is increasing its effort in various phases of this field to co-operate with as many broadcasting organisations of the world as circumstances permit.

In the year 1937, Japan participated in twenty-nine international broadcasts.

Overseas Broadcast The Broadcasting Corporation of Japan inaugurated daily one hour short-wave broadcast, that is 2:00 to 3:00 p.m., Tokyo Time, under the name of "Overseas Broadcast" on June 1st, 1935 with the object of furnishing the residents in the foreign countries with accurate information about Japan and of introducing the culture of Japan.

The programmes of this broadcast consist of news in Japanese and English, music, entertainment, talk and eyewitness accounts of various sport events and other subjects, specially selected to present a true and interesting glimpse of the real Japan to all listeners abroad.

Though this broadcast was mainly directed to the West Coast of North America and Hawaii, the programmes of this broadcast met with an enthusiastic response and reports of good reception and much encouraging response complimenting the contents of the programmes were received, not only from the areas to which they were specifically addressed but also from other parts of the world.

Moreover, the Corporation was carrying out during the past year experimental transmissions, one for the East Coast of North America and South America and the other for Europe, each twice a week. These transmissions also met with considerable response and a large number of reception reports from those who had listened to these broadcasts in various countries to which these transmissions were specifically directed.

Encouraged by the good results of these experimental transmissions, the Corporation has decided to inaugurate three more daily transmissions, and the first programme of these transmissions went on the air on January 1st, 1937.

Transmitters of 20 kilowatt are used temporarily for these broadcasts, but they will be replaced in the near future by 50 kilowatt transmitter which is now under construction.

From the beginning of April 1937, the broadcast to Europe, on Monday, Wednesday and Friday, will be in English and German and on Tuesday, Thursday and Saturday, French and English will be employed. On Sunday the broadcast will be only in English.

In the other three directions broadcasts will be in Japanese and English.

Programme Hours The working hours of each broadcasting station in Japan differ a little according to their local conditions as well as the seasons of the year. According to the report of the JOAK, the average broadcasting hours per day in 1938 were 11 hours and 26 minutes in the general broadcasting and 4 hours and 36 minutes in the broadcasting for cities.

The first programme of the day is sent out at 6.00 a.m. (from April to October) and at 6.30 a.m. (from November to March), and the closing announcements of the day's programme goes on the air at 9.50 p.m.

The following tables give the number and hours of broadcasting and the programme statistics classified by programme classes of JOAK.

New Broadcasting Houses Development of our broadcasting is reflected in the establishment of two large broadcasting houses, one in Osaka and the other in Tokyo at a total cost of six million yen. The Broadcasting House in Osaka was opened to service in November 1936. This six storied building (exclusive of the central tower which is three storied) covers an area of 1927 sq. metres, and comprises 13 studios in all.

While in Tokyo, a site of 3950 sq. metres was chosen near the Hibiya park for a six storied building which will house 16 studios and rooms for various department offices. The construction was completed early in 1939, and the new white reinforced building adds another element of beauty to the business centre near Hibiya Park. In September, 1935, a research committee for the design of studios to be housed in these broadcasting houses was formed. This committee comprises electrical, acoustical and architectural specialists, and preliminary practical tests are being carried out at present at the JOAK building at Atagoyama.

Research Laboratory The technical research laboratory of the Corporation was established at Setagaya district in western part of the city of Tokyo in April 1930. The work of the laboratory is directed mainly to the fundamental and general researches as well as to the various possibilities of broadcast transmission and reception apparatus, wave propagation phenomena, visual broadcasting, patents and other problems related to the art of broadcasting.

Owing to the rapid development of the radio art, the laboratory was found to be too narrow to continue these researches, and the premises and building were enlarged in 1936.

Television For some years past re-

Digitized by Google

search work of television has been going on separately at the Waseda University, Hamamatsu Higher Technical College, Tokyo Electric Co., Electrotechnical Laboratory of the Department of Communications and the Research Laboratory of the Corporation. They had their own special system and the comparison of merits between them is a question very difficult to solve. A somewhat different line of investigation is now being undertaken, namely, whether it is possible to combine advantages of these systems and realise the experimental broadcasting of the television.

The Television Society of Japan, which was formed in 1934, and which comprises the investigators of television throughout the country is earnestly recommending to start the experimental broadcasting, and the Corporation is now considering the matter to comply with the recommendation. The desirability of its early realization is justified, though the policy of the Corporation towards the question is yet to be disclosed. The special building for the purpose of the television research is under construction at present on the premises of the Research Laboratory.

Wireless Exchange System Although the growing trend of listeners of broadcast has been of a steady and healthy nature, the listeners are mainly concentrated in the city districts and the percentage of listeners to population in the country districts remains far below that of the former. This difference is chiefly attributed to the financial difficulties of the country districts. To conquer this drawback the Corporation is planning to start the wireless exchange system, with special units suitable for the nature of its service.

Technical experiments to find out the most efficient method for this system are being carried out at present in different regions throughout the country. A representative is chosen in a village and a broadcast receiving set is installed there, the operations and care of the set being entrusted to the representative and the audio output distributed by specially constructed lines to the subscribers in the village. The results in various districts so far are proving to be successful, and as soon as the plan is authorized by the government it is expected to be actually put in service at an early date. It is expected that by applying this system the majority of the population in country districts who are individually not able to pay the cost of a receiving set, the expense for maintenance and the charge for power supply for the receiving set, will now be able to enjoy the benefit of the broadcasting.

This system appeals also to those who find wireless reception difficult or who wish to avoid the trouble of looking after a wireless set.

Listeners When the Tokyo broadcasting station was opened on the 22nd of March 1925, the total number of listeners for the whole country was something like 5,400. On the 20th of August 1926, when the Broadcasting Corporation of Japan was formed, the number of listeners had reached a figure of over 338,2000.

The listening fee of two yen a month had been calculated to be charged at the time when the broadcasting services were started, was reduced to one Yen due to the unexpected increase in the number of listeners. This rate was uniform all over the country.

In September 1928, the number of listeners reached the 500,000 mark. In February 1932, three years and four months after, the number ran into 1,000,000, and in April of the same year, the subscription fee was reduced to seventy-five sen. The so-called "Golden Age" in our broadcasting begins at this period and in June 1933, the number passed the 1,500,000 mark, and keeping up the momentum, it leapt into 2,000,000 in April 1935. In commemoration of this growth, the subscription fee was reduced to the modest sum of 50 sen a month, which is being kept up to this day.

To sum up, it took about seven years for the number of registrations to reach the first 1,000,000; the next 1,000,000 was reached in three years only; while the subscription fee has been reduced to half the original sum during these 10 years,—a rate without parallel elsewhere in the world.

Thereafter, there was a tendency for the number of registrations to go on rapidly increasing, and on March 31, 1939, the number reached 4,165,729, the rate of distribution representing 29.4 per 100 families.

REGISTRATIONS BY CITIES AND RURAL COMMUNITIES

Year	Total Number of licence holders	%	Cities Number of licence holders	%	Towns & Villages Number of licence holders	%
1933	1,627,836	100	1,166,777	71.7	461,056	28.3
1934	1,897,398	100	1,364,573	71.9	532,825	28.1
1935	2,304,479	100	1,628,059	70.6	676,420	29.4
1936	2,776,189	100	1,915,857	69.0	860,332	31.0
1937	3,402,489	100	2,259,513	66.4	1,142,976	33.5
1938	4,165,729	100	2,632,629	63.1	1,533,100	36.8

The new registration in the course of 1938 numbered 878,089, showing a decrease of 64,461 (6%) from the previous year.

When the increase of licence holders of 763,240 is divided between cities and towns, the former occupies 63.1% of the total. Recently there is a marked tendency of the rate being on the increase with towns, and the reverse is the case with cities.

When the number of new registrations during 1938 are classified respectively according to the professions, and set

Digitized by Google

against the corresponding percentages for the previous year, as is done in the following list, we find that the increase in the percentage was recorded in agriculture, manufacturing industry, mining industry.

NEW REGISTRATION BY PROFESSIONS

(In 1937 and 1938)

Professions	New registration Number		Rate		Increase or Decrease
	1938	1937	1938	1937	
Agriculture	161,052	138,760	23.4	17.6	22,292

Households works	379	546	0.1	0.1	-167
Other industries	1,615	1,538	0.2	0.2	77
No industry	46,793	54,273	6.8	6.9	-7,480
Total	682,555	745,963	99.0	94.7	-63,408
Schools, public bodies and others	195,534	196,587	1.0	5.3	-1,053

Finance Since the beginning of its establishment, the Broadcasting Corporation of Japan has pursued its policy of lightening the financial burdens upon the listeners by reducing the subscription fee down to its minimum.

To commemorate the tenth anniversary of the opening of broadcasting in this country and to popularise radio throughout Japan, the Corporation carried out the reduction of the subscription fee from seventy-five sen to fifty sen on April 1st, 1935. This resulted in a great increase in the number of subscribers, viz. the increase for the year ended March 31st 1936, was 443,015. But the net revenue from this fee and others decreased from 15,874,151 yen for the fiscal year of 1934 to 13,447,631 yen for the fiscal year of 1935.

On the other hand, the expenditure, including the depreciation of building and plant, amounted to 13,088,702 yen for the fiscal year of 1935, showing an increase of 856,071 yen against the last year's.

The greater part of its revenue is spent on the maintenance and development of the service, as well as on the various kinds of new enterprises.

Among the various items of expenditure, there is the contribution to the Home Office, the sum of 1,262,465 yen for fiscal year of 1935, which was distributed among the prefectures as contribution to sanitary measures.

Besides this, the Corporation paid to the Government the sum of ¥395,446 as the number of listeners registered at the end of the preceding financial year.

CHAPTER XXV

LAND AND AIR TRANSPORTATION

State Railways

Historical Background

Japan's railway projects date from 1869, when the Government formed a plan to lay a trunk line linking Tokyo with Kyoto and Kobé, together with some branches to Yokohama and Tsuruga, a port on the Japan Sea. As the first step, half a million yen was sanctioned for the work between Tokyo (Shimbashi) and Yokohama, but the State Treasury was in no position to find this amount, while private capital declined to venture into this novel field of investment. It was at this time that an Englishman, Horatio Nelson Lay, by name, came forward with a proposal to furnish the required funds. The terms offered by him were accepted and a Japanese loan for one million sterling was placed on the London market. With the arrival of a British engineering corps and materials, the first sod was dug on the 28.962 kilometre Shimbashi-Yokohama section in March, 1870, and on the 32.18 kilometre Kobé-Osaka section in November, 1870. The gauge adopted for these lines was one of 1.067 metres, which has later become the standard gauge of the Japanese railways.

Tokyo - Yokohama and Other Lines The work between Shimbashi and Yokohama was completed in September, 1872, while the Kobé-Osaka line was opened to traffic in 1874 and it was further extended to Kyoto in 1877. These sections have practically formed the nucleus of what now constitutes the Tokaido Line, one of the main arteries of railway traffic in Japan. In 1880, the Kyoto-Otsu section was completed and in 1884 a further extension with a length of 41.834 kilometres between Tsuruga and Nagahama, a town along Lake Biwa, was completed and opened to traffic in pursuance of the railway idea of linking up the Pacific and the Japan Sea. Meanwhile, a survey was made on the Otaru-Horonai section in Hokkaido, where colonization work was being strenuously encouraged. Construction of this section was soon undertaken and the 88.495 kilometre length was opened to business in 1882, thus bringing the total length of railway under Government ownership toward the close of 1884 to 185.035 kilometres.

Private Lines About this time the Government was in financial difficulties and the building of State railways practically came to a standstill except for a few extensions. It was at this time that, not being in a position to undertake the work itself, the Government began to encourage private enterprise, the encouragement mostly being in the shape of subsidies. Under these circumstances, many private railways were built in rapid succession, the most notable among them being the Nippon Railway, the Sanyo Railway, the Kyushu Railway and the Hokkaido Colliery Railway. The total length of line thus built by private capital in the ten years between 1881 and 1891 aggregated 1,874.485 kilometres, a length more than double that of the State which did not exceed 886.559 kilometres by the end of 1891.

The Trunk Line Prior to this, the Government decided to lay a trunk line through the Nakasendo, the old mountainous highway of Central Japan, but in view of engineering difficulties along this line it was subsequently abandoned in favour of the level region of the Tokaido. Work on the new route was finished in July, 1889, whereby a through service was opened for a distance of 611.42 kilometres between Tokyo and Kobé. Then a branch to Yokosuka was opened and a 160.9 kilometres section between Takasaki and Naoétsu was completed with the exception of 9.654 kilometres over the Usui Pass. This difficult section, for which the Abt rack rail system was adopted, was not opened for service until 1893.

The Railway Construction Law In view of the industrial progress being made in the country there was an urgent demand for the speedy construction of more railways. The entire length of Japanese railways at that time amounted to only 2,574.4 kilometres and the bulk of contemplated lines was in remote districts with no prospect of immediate profit, and on that account did not appeal to private enterprise. These circumstances showed both the

Digitized by Google

Government and the public the advisability of state acquisition of private lines and opinion was further strengthened by the financial failure of some of the private concerns. In view of this, in 1892, the Railway Construction Law was passed and the Government set to work constructing important lines. The law embodied a comprehensive programme of railway building and contained the guiding principles on which the railway system of Japan was founded. At the same time the matter of consolidating the different lines into one complete system was being studied by a committee of enquiry appointed by the Government. The acquisition of private railways was accomplished in October, 1907, the subsidiary businesses being taken over at the same time. Immediately after nationalization the State Railways were organized under a Railway Bureau, which was directly responsible to the Cabinet. But in May, 1920, a separate Department of State was created to deal with railway affairs and the Minister of Railways was appointed to control it.

Railway Network

The law of 1892 authorized the Government to build certain specified lines within a certan limit of time, and also to buy up such private railways as were judged necessary for the completion of a unified system. Pursuant to this programme the State Railways proceeded with the work of construction and in 1906 and 1907 purchased 17 private lines to a total length of 4,547.034 kilometres, thereby bringing under national control all the railway lines in Japan proper, with the exception of feeding lines of local importance. In 1922 after a careful survey of the State lines the Railway Construction Law was modified and some new lines were added to the original programme. At the same time it was decided that, pursuant to the new law, such local lines as formed a connecting link between the State lines, either already projected or considered necessary for completing a unified national railway system be purchased.

Organization and Staff

Prior to the nationalization of the private lines, the State lines were operated on a departmental system based on the principle of centralization. The system worked well because the management of the State lines was a relatively small business, but when the Government assumed the management of all lines it was found unequal to the extra work, and in December, 1906, the Imperial Government Railways were removed from the control of the Minister of Communications and assigned to a newly created administrative body, the Railway Board. The administration was then decentralized and remains so today. The existing system of organization of the State Railways was established in May, 1920, when the said Railway Board was made, by virtue of Imperial Ordinance No. 143, an independent department of the Central Government. According to the regulations, the Department of Railways not only controls the whole of the State lines, but supervises the provincial railways and tramways in Japan proper. It maintains one central and six regional offices. The Central Office is directly governed by the Minister of Railways and manages all matters relating to the State Railways as well as maintaining supervision over provincial railways and tramways. It is composed of eight bureaux according to the kind of business dealt with. They are the Minister's Secretariat; Bureau of Local Railway Administration; Bureau of Traffic and Operation; Bureau of Construction; Bureau of Maintenance and Improvement; Bureau of Mechanical Engineering; Bureau of Electricity; and Bureau of Finance and Purchase. The Central Office also controls Regions, District Construction, District Improvement, District Electric Offices and Tokyo Railway Hospital. On April 23, 1930, by virtue of Imperial Ordinance No. 83, a further bureau, the Board of Tourist Industry was created as a separate bureau of the Department of Railways. The bureau is controlled by the Minister of Railways and attends to the business of the tourist industry, its object being to encourage people of other lands, by advertising and in other ways, to visit Japan and see her incomparable scenic beauty, natural charm and national manners and customs, and to encourage Japanese living at home to take trips to different parts of the Empire.

As stated above, the administration of the State Railways is decentralized into six regions, Tokyo, Nagoya, Osaka, Moji, Sendai and Sapporo. Each region is a complete unit and is in charge of a director who is vested with power to conduct, at his own discretion, all affairs relative to his jurisdiction, excepting matters of general and large import for which decision of the central administration has to be obtained.

In the State Railways of Japan the members of the staff are either Government officials or employees.

On March 31, 1937 there were al-

Digitized by Google

together 227,689 (8,118 females) servants in the employment of the State Railways as against 218,352 in the preceding year. The total salary for the year 1936-37 was ¥153,812,691 as against ¥147,990,026 in 1935-36. The average annual salary per person in employment was ¥676. As compared with the preceding year, the staff shows an increase of 9,337 during the year, and the annual payment of salaries increased by ¥5,822,665.

Traffic

Goods and passengers carried by the State Railways in Japan proper since 1914-15 follow :

Fiscal years	Goods Metric tons	Passengers (Unit 1,000)	Goods Traffic	Working Revenue Passenger Traffic	Miscellaneous	Total
				(Unit ¥1,000)		
1914-15	35,837,241	166,092	53,372	56,366	2,429	112,169
1921-22	58,312,333	454,535	171,135	219,228	7,234	397,599
1922-23	65,095,702	512,754	183,573	237,446	8,574	429,593
1923-24	65,818,955	579,288	181,182	255,284	6,888	443,354

1930-31	64,087,099	824,152	189,161	261,131	7,848	458,140
1931-32	60,590,746	787,222	180,365	245,359	7,824	433,540
1932-33	61,732,756	781,149	178,717	239,017	8,219	425,954
1933-34	71,970,592	841,316	203,189	261,159	9,905	474,254
1934-35	77,477,837	913,564	225,246	282,857	10,564	518,668
1935-36	81,039,134	985,041	233,397	300,422	10,714	544,534
1936-37	89,342,111	1,058,630	259,773	326,610	11,786	598,171
1937-38	87,294,310	1,169,574	279,207	360,160	—	639,368
1938-39	97,440,162	1,357,078	320,421	418,040	—	738,461

In March, 1937, the total working kilometreage of the State Railways reached 17,422.2 kilometres and shows an addition of 391.8 kilometres over the preceding year. The total train kilometreage amounted to 255,412,711 kilometres, being an increase of 14,613,676 kilometres over the preceding year. The number of passengers carried by trains, buses and ships during the year totalled 1,076,157,992 and the aggregate volume of goods transported amounted to 92,995,602 metric tons. As compared with the preceding year the former showed an increase of 76,977,475 passengers and the latter 8,880,750 metric tons. The receipts from these two sources amounted to ¥586,385,014, showing an increase of ¥52,565,591 over the preceding year.

Motor-car Service In March, 1936, the total working kilometreage of the motor-car service reached 1,980 kilometres with 37 routes, being an addition of 215 kilometres.

The total number of passengers carried over those routes during the year came to 8,944,321. The aggregate volume of goods handled amounted to 73,724 metric tons. The receipts from passengers amounted to ¥2,074,170 and those from goods traffic to ¥209,455, the total being ¥2,283,625.

Ferry Service At present the State Railways run this service at 5 localities. They are Aomori-Hakodate ferry service connecting the main land with the island of Hokkaido, Shimonoséki-Moji ferry service connecting the main land with the island of Kyushu, Shimonoséki-Fusan route which connects the islands with the Asiatic mainland, Uno-Takamatsu service which links the Sanyo line (main land) with the Island of Shikoku and Hokkaido-Karafuto route linking Japan proper with the Island of Karafuto or Saghalien. Besides, there are a few minor routes provided with smaller steamboats or motorboats for linking such places of note for sightseeing as Miyajima in the Inland Sea. In March, 1937, there were altogether 60 boats consisting of 31 steamers and 30 harbour boats owned by the State Railways apart from those chartered to private companies. The gross tonnage of these boats amounted to 62,048.33 tons, showing an increase of 12,962.1 metric tons in capacity as against the corresponding figures of the preceding

Digitized by Google

year, and the number of boats increased by 1.

Accident and Casualty Returns The number of accidents reported during the year totalled 5,525, or 21.1 per 1,000,000 train kilometres, showing a decrease of 1,037 in number and of 6 per 1,000,000 train kilometres as compared with the preceding year. The number of casualties, including those caused by accidents, errors or unknown causes, numbered 3,420, during the year, or 13.1 casualties per 1,000,000 train kilometres. As compared with the preceding year this is a decrease of 142 in the total number, and a decrease of 1.5 per 1,000,000 train kilometres. The number of casualties caused by suicide was 1,836, or an increase of 10 as against the preceding year.

Length of Open Lines

The total length of State lines open for traffic on March 31, 1937, the end of the fiscal year of 1936, reached to 17,422.204 kilometres as against 17,030.365 kilometres in 1935-36, showing an increase of 391.839 kilometres. The total length of tracks reached 27,801.925 kilometres as against 27,299.552 kilometres in 1935-36, indicating increase of 502.373 kilometres. Of the total length of lines open for traffic 15,253.323 kilometres are covered by single tracks, 1,945.749 by double tracks, 18.800 by triple tracks, 204.332 by quardruple and the rest by multiple tracks.

Works and Plants

At the end of the fiscal year under review there were altogether 22 works and 3 detached plants in operation.

On March 31, 1937 there were 15,500 workmen, on the rolls and their monthly wages aggregated ¥924,687.

The number of day's work during the year aggregated 3,492,846 and the wages paid ¥9,151,934. The expenses involved in the workshops ¥53,861,025, consisting of ¥22,471,104 for the repair and manufacturing expenses and ¥31,389,921 for the purchase of materials and showed an increase of ¥6,715,899 in the total expenditure as compared with the preceding year.

Rolling Stock

The number of locomotives in operation at the end of the fiscal year of 1936-37 was 4,235. The number of passenger carriages aggregated 11,209, the total number of covered wagons was 73,184.

Electric Power

On March 31, 1937 there were altogether 3 power stations, 43 substations, 208 distributing houses in operation. In 1935-36, there were altogether 10 alternators representing 98,454 k.w.a., 156 converting machines for electric traction with a capacity of 243,917 k.w., and 616 transformers representing 723,844 k.w.a. in operation at these plants.

Finance

By Railway Special Account Law, enforced since 1909, the budget of the State Railways was made separate from the general finances of the State. Furthermore, the law provides that all capital expenditure for railway construction and improvement should be met from the revenue accruing from all sources of traffic and that the expenditure should, in case the revenue is not sufficient to cover it, be supplemented by the proceeds of public loans issued as a charge on this special account.

Capital Revenue and Expenditure The addition to the consolidated capital of the State Railways during the year under review came to ¥945,288,159 as accruing from the railway profit, proceeds of the public loans and the miscellaneous receipts transferred thereto, while ¥793,925,916 was deducted therefrom partly on account of the removal and transfer of the railway property and partly owing to the depreciation, the conversion or the redemption of public loans, leaving thus a ballance of ¥151,362,243 as the actual increase in the capital. Then the total capital investment of the State Railways from the inception of the Railway operation to March 31, 1937 amounted to ¥4,089,624,979, that is, the balance shown above plus ¥3,938,262,736, the aggregate capital on April 1, 1936. It should also be noted that the capital is, according to the Railway Account Law, divided into capital proper and debenture capital. The debenture capital represents the liabilities at the charge of the Railway Special Account, that is, the proceeds from the public and floating loans and the loans issued for the purchase of private railways. The remaining portion forms the capital proper which includes, for instance, the net profit transferred from the railway revenue account, the proceeds of the sales of property, redeemed debentures, surplus on the stores and workshop account and miscellaneous receipts transferred to the capital revenue. Of the total consolidated capital shown above the capital proper claimed ¥2,118,446,062 and the debenture capital ¥1,971,178,917.

Digitized by Google

The Capital Revenue Settled for the year under review was ¥173,352,444 as against ¥158,692,723 of the expenditure settled, being an increase of ¥19,319,044 for the former and of ¥7,688,444 for the latter as compared with the preceding year. The increase in the revenue settled was attributable chiefly to the increase in amount transferred from the railway profit, as well as proceeds of sundry receipts, while the gain in the expenditure settled was due to the increase in the expenditure on the railway construction, and the improvement and the motor routes, as well as the sum appropriated to the redemption of liabilities. Below are given returns on this account settled for the past three years.

Item	1936-37	1935-36 (In yen)	1934-35
Capital revenue	172,936,606	153,614,051	139,982,882
Surplus on stores account	425,838	419,349	332,406
Total revenue	173,352,444	154,033,400	140,315,288
Construction, improvement, and motor-car routes	136,405,478	129,200,747	118,145,718
Redemption of debts	22,287,245	21,803,532	6,700,216
Total expenditure	158,692,723	151,004,279	124,845,934

Stores Account The settled amount of Stores Account Revenue for the year 1936-37 was ¥190,814,739 and the expenditure on this item amounted to ¥185,415,437, or an increase of ¥20,625,698 for revenue and of ¥13,192,538 for expenditure as compared with the previous year. The increase in the revenue was accounted for partly by the larger proceeds of sales of railway stores, and partly by the increase in receipts accruing from repairs of railway stores and from the supply of electric current while the increase in the expenditure is accounted for by the rise in the stores and workshop expenses and the charge for electric current.

Item	1936-37	1935-36 (In yen)	1934-35
Railway stores and workshop receipts	190,814,739	170,189,041	154,461,933
Railway stores and workshop expenses	185,415,437	172,222,899	159,225,660

Revenue Account The total revenue settled during the year amounted to ¥796,098,485 and the total expenditure ¥650,636,455 which are respectively ¥81,275,888 and ¥45,799,860 more than in the previous year. The increase in the revenue was attributable to the increase of the traffic and the sundry receipts, as well as receipts on suspense account and advances, while increase in the expenditure was accounted for by the growth in working expenses and subsidies to local railways, as well as the increase in refunds and advances appropriated for the C.O.D. payments.

The Revenue Account settled for the past three years is as follows :

Item	1936-37	1935-36 (In yen)	1934-35
Revenue:			
Traffic Receipts	591,252,994	538,592,712	512,931,499
Sundry Receipts	11,809,580	10,731,552	10,624,683
Receipts on Suspense Account & Advance	193,035,911	165,498,333	150,854,524
Total	796,098,485	714,822,597	674,410,706
Expenditure:			
Working Expenses	362,542,819	333,854,537	318,543,876
Interest Charges	83,206,220	93,750,891	91,788,215
Refunds and Advances	198,005,869	169,836,599	156,101,827
Secret Service Fund	27,440	27,440	27,440
Subsidies to Local Railways	6,854,027	7,367,128	7,052,618
Total	650,636,455	604,836,595	573,513,976

Working Results of the State Railways in 1937 and 1938

The settled accounts of the State Railways for the fiscal years 1937-38 or 1938-39 are not yet available, but a tentative report is published by the Railways Department as follows:

	Passengers	Goods (Metric tons)	Passenger earnings	Goods earnings (Unit ¥1,000)	Total earnings	Increase over the Previous Year
1937-38	1,169,574,000	87,294,310	360,160	279,207	639,368	41,197
1938-39	1,357,078,000	97,440,162	418,040	320,421	738,461	99,094

Private Railways

General At the end of March, 1937 the number of local railways in Japan proper was 250, a decrease of 7 as compared with the previous year. The

Digitized by Google

total open kilometreage was 7,018.77 km., a decrease of 78.79 km. Their aggregate capital amounted to ¥1,223,291,-955, an increase of ¥9,433,914.

Traffic During the 1936-37 year the number of passengers carried was 575,-602,867, the coaching receipts amounting to ¥68,929,859. As compared with the preceding year the number of passengers carried increased by 43,467,922 or 8.1 per cent, the coaching receipts by ¥4,757,392 or 7.4 per cent. The increase both in traffic volume and coaching receipts was accounted for by the improvement of the financial situation that had been in depressed condition these few years. The average kilometres of journey per passenger came to 8.5 kilometres and the average coaching receipts per passenger ¥0.12, which means that the former decreased by 0.1 kilometre and the latter by ¥0.01 as compared with the previous year. The total amount of goods moved during the year under review figured 30,059,-157 metric tons and the receipts accrued therefrom amounted to ¥22,308,-862. There are a gain of 1,929,464 metric tons in the volume and of ¥888,264 in the receipts. It appears that the return of business prosperity, coupled with the larger demand for munitions and the heavy crops, has brought about the boom of goods traffic during the year, resulting in the swell of the volume of goods hauled and the receipts therefrom. The average goods receipts per metric ton came to ¥0.742, which was a gain of ¥0.19. Altogether 2,025 accidents took place on all the local railways, in which 450 persons were killed and 567 injured. The number of accidents increased by 256, the injured by 90, and the killed by 142 against the corresponding figures of the previous year.

Finance The total working revenue of the local railways during the year aggregated ¥101,710,620 as against their total working expenses of ¥57,558,086, leaving a profit of ¥44,152,534. As compared with the preceding year the working revenue showed a gain of ¥7,060,861, and the working expenses ¥4,014,068. The net profit for the year came to ¥44,504,446, which is composed of the profit shown above plus ¥34,649,111 of miscellaneous receipts, less ¥20,546,935 of interest paid and ¥13,750,264 of other charges. The earnings per day per kilometre ¥39.2, and the profit per day per kilometre ¥17.0 showing an increase of ¥2.2 and ¥0.9 in earnings, and profit respectively against the figures for the previous year.

Assets and Liabilities Both assets and liabilities of the private railways at the end of 1936-37 fiscal year totalled ¥2,-537,638,492.

Employee On March 31, 1937 there were altogether 40,562 employees on the staff of the local railways, their monthly allowances amounting to ¥2,250,463, or a decrease of 120 and an increase of ¥145 respectively.

Tramcar Service

Growth of Tramways The tramways in Japan date back from 1880, when an application was tendered for the construction of the Tokyo Horse Tram Co.'s line which was completed and opened to traffic in 1883. As provided by the Tramway Law now in force, all the tramways in Japan are constructed as a rule on highways. The street railways, a certain number of suburban railways and others laid in provinces are placed under the control of the Law. Such public bodies as cities, towns and villages may take the management of tramways without restriction. Steam and electricity are mostly employed as motive power except a few local tramways where gasolene, horse or human power is used for the purpose.

Lines in Operation On March 31, 1937 there were 120 tramways open to business with a length of 2,520.91 kilometres and an aggregate capital of ¥1,715,026,-289, being a loss of 8 in number, 32.64 kilometres in length, but a gain of ¥205,-870,550 in capital. Classified according to kinds of motive power they are made up as follows :

Kind of power	No. of Tramways	Kilometreage k.m.	Capital (In yen)
Electric	81	2,071.61	1,679,584,126
Steam	7	111.20	1,691,000
Steam and gasolene combined	7	85.50	3,945,000
Gasolene	9	84.50	21,967,500
Horse power	13	130.10	7,613,000
Human power	7	37.60	225,663
Total	120	2,520.91	1,715,026,289

New Lines, Lines Under Construction During the year 8 tramways with a total length of 18.10 kilometres were newly opened to business, while 3 tramways with a total length of 23.24 kilometres were granted charters for construction. Most of them use electricity as power and aim at conducting transportation in and near towns. The tramways under construction at the end of the year numbered 40 and their aggregate length measured 445.73 kilometres while the total capital amounted to ¥15,372,000, be-

Digitized by Google

ing a decrease of 14 in number, of 144.26 kilometres in length, and of ¥4,306,000 in capital respectively as against the preceding year.

Results of Working The number of passengers carried during the 1936-37 period was 1,699,891,370, the coaching receipts resulting therefrom being ¥113,-811,841. Compared with the preceding year the number of passengers increased by 5.4 per cent and the receipts by 5.2 per cent.

The goods carried during the period was 1,755,804 metric tons, and the goods receipts ¥1,269,762, being a loss of 0.8 per cent in receipts and a gain of 3.2 per cent in the volume of goods carried.

The total revenue of the tramways during the year amounted to ¥121,498,710 as against their total working expenses of ¥72,651,163, leaving a balance of ¥48,-847,547, as profit. This was a gain of 5.4 per cent in the revenue, 6.4 per cent in the profit and 6.4 per cent in the working expenses. The working revenue per day per kilometre was ¥136.90, the working expenses per day per kilometre ¥81.86, and the profit per day per kilometre ¥55.04, being an increase of ¥9.44 in revenue, of ¥5.13 in expense and of ¥4.31 in profit as compared with the preceding year. The ratio of the working expenses to the working revenue stood at 59.8 per cent, or a decrease of 0.4 per cent while the ratio of the profit to the construction expenditure was 5.9 per cent or 0.3 per cent more than in the preceding year.

Assets and Liabilities The total capital investment of all the tramways open to business up to the end of the year under review amounted to ¥1,695,-465,655 of which ¥1,426,871,005 was paid up and ¥843,874,497 was claimed by construction expenses for open lines. Besides, there was ¥666,781,595 in the shape of debentures, floating debts, overdraft and bills payable, etc. The total amount of the aggregate balance sheet was ¥2,537,638,492.

RESULTS OF WORKING OF LOCAL RAILWAYS IN JAPAN PROPER

1926	2,106,767	129,550,079	75,811,932	53,738,147
1927	2,160,047	130,422,346	75,187,152	55,235,194
1928	1,974,738	137,063,969	77,949,253	59,114,714
1929	1,883,670	143,218,209	82,540,855	60,677,356
1930	1,740,760	140,472,807	80,752,985	59,719,822
1931	1,682,622	128,009,229	77,222,809	50,786,420
1932	1,422,443	116,645,225	72,558,243	44,086,982
1933	1,356,921	109,669,986	68,128,253	41,541,733
1934	1,497,023	110,828,843	67,525,124	43,303,719
1935	1,907,384	113,112,507	70,689,908	42,422,599
1936	1,699,549	114,924,120	69,188,340	45,735,780
1937	1,755,804	121,498,710	72,651,163	48,847,547

Rolling Stock On March 31, 1937 there were altogether 93 locomotives, 6,606 carriages and 1,683 goods wagons. This is an increase of 93 locomotives, and of 73 carriages while the total number of the wagons remains same as in the preceding year.

Staff On March 31, 1937 the staff of the employees numbered 51,436 with their monthly compensation of ¥3,775,642, or loss of 877 in number of employees and of ¥159,748 in compensation.

Lines Used Exclusively On March 31, 1937 the number of the lines owned by private individuals or companies came to 84 of which 82 were opened to traffic with an aggregate open length of 392.62 kilometres, while the total length of the lines not yet opened to traffic reached 10.25 kilometres.

Land Transportation in 1938-39

Increase in Volume of Transportation by Government Railways The business conditions of the Government Railways during the 1938-39 fiscal year ending March 31, 1939, were best of the recent years due to the activities of general industrial and commercial circles, and the movement of passengers and goods in connection with the emergency. As it is given in the third page of this chapter the total proceeds amounted to ¥738,462,000, even without including miscellaneous revenue which may have reached over ¥12,000,000. The amount represents an increase of ¥99,094,000 or 15.5 per cent over the previous fiscal year. Both the number of passengers carried and the volume of goods hauled showed a historical increase as they are given in the following table as published by the Department of Railways on June 12, 1939:

Digitized by Google

VOLUME OF TRAFFIC BY GOVERNMENT RAILWAYS DURING APRIL, 1938-MARCH, 1939

(Unit: Metric ton and yen)

	Passengers carried	Goods hauled	Passenger earnings	Goods earnings	Total earnings
By Train					
1938-39	1,341,508,085	97,370,770	414,661,457	319,914,923	734,576,380
Increase over the Previous year	184,627,187	10,125,346	57,194,388	41,046,960	98,241,348
By Motor-bus					
1938-39	15,570,098	69,392	3,378,849	506,557	3,885,406
Increase over the Previous year	2,876,685	20,506	685,515	166,848	852,363

Private Railways The business conditions of private railways in 1938 and 1939 are improving, as a whole, with the active traffic caused by the general business boom in the country, as it is shown in the following table:

BUSINESS RESULTS OF 30 PRIVATE RAILWAY COMPANIES IN 1938

(Unit: ¥1,000)

Tokyo-Yokohama district	Paid-up Capital	Working Revenue 1st Half	Working Revenue 2nd Half	Net Profit 1st Half	Net Profit 2nd Half	Rate of Dividend 1st Half	Rate of Dividend 2nd Half

The aggregate amount of the paid-up capital of 15 representative private railways, which are marked with star in the above table, in the second half of 1938 remained almost the same with the second half of 1937, only one company, i.e. the Keio Electric Railway Company, increasing it from ¥12,900,000 to ¥14,513,000. But, their aggregate amount of profits increased from ¥21,028,000 for the second half of 1937 to ¥26,257,000 for the second half of 1938, their average rate of profits from 10.5 per cent to 10.9 per cent.

Kammon Tunnels under Construction

Two under sea tunnels which connect the Main Island and the Island of Kyushu are under construction. The one is a national road which connects Shimonoseki on the side of the Main Island and Moji on the other side of the Seto Strait, and the construction work is carried on by the Department of Home Affairs since August, 1937. An experimental tunnel was cut through on April 26, 1939, and the work for the construction of the proposed tunnel was commenced on May 12, 1939.

The other is a railway tunnel which connects the State railways on the Main Island and Kyushu through the sea bottom of the O-Seto strait. An experimental tunnel was completed on April 19, 1939, and it gave assurances for the possible success of the gigantic work of construction of the under sea railway.

The necessity of a speedy and more convenient transportation facilities between the major cities on the Main Island and Kyushu has been long felt, especially with the rapid industrial growth of North Kyushu in the recent years. The volume of transportation between Shimonoseki and Moji reached to 6,890,000 passengers, 4,520,000 tons of goods in the yearly average for the three years of 1930, 1931 and 1932, and the transportation has been carried on by a daily mobilization of 40 big steam

Digitized by Google

ships and 800 sailing vessels. The Seto strait is in the international sea transportation route and the movement of these numerous vessels is quite cumbersome for the passage of big ocean liners. The new plan is to take away the trouble and prepare for the future increase of traffic between the two islands.

The total mileage of the new road is 5,340 metres, 4,190 metres of which is the tunnel and the part which is cut through the rocks under sea extends 1,150 metres with a width of 7.5 metres. For the ventiration of the tunnel the transverse flow system or distribution system. The expenditure is estimated at ¥17,000,000, and the work will be completed within the coming 10 years. When completed the tunnel will have a per hour capacity of having 2,500 automobiles and 2,000 bicycles pass it.

The under-sea railway tunnel was first contemplated by the Department (then Board) of Railways in 1911 when the late Count S. Goto was the president of the Board. At that time opinions, were divided on the choice of a tunnel or a bridge, but the former was finally decided upon, but the plan has been laid on the table for 25 years until an experimental work was started in September, 1936. The railway traffic on both sides of the strait between the Main Island and Kyushu is congesting with 37 passenger trains daily stopping at and starting from the Shimonoseki Station, the western terminal of the two trunk lines on the Main Island and 33 passenger trains stopping at and starting from the Moji Station, the north-eastern terminal of railways in Kyushu. These two terminals are connected with ferry boats which run 50 times a day between the two ports to carry the passengers and their baggages. Besides, 20 luggage trains daily run to and from the Shimonoseki Station, and some of them are conveyed to the other shore on board the ferry cargo-boats which have a capacity of loading from 6 to 8 wagons each. The daily volume of traffic by these ferry boats conducted by tthe State railways was 12,771 passengers and 682 wagons in 1934-35 fiscal year, and it increased to 16,652 passengers and 1,073 wagons in 1938-39, increasing 31 per cent and 57 per cent respectively. At present a passenger has to waste 50 minutes in taking the train on the other side of the strait. The completion of the under-sea railway tunnel will shorten the conveyance of goods across the strait by 10 hours, and a passenger may be carried within 10 minutes instead of 50 minutes or while he is taking a comfortable nap.

The total length of the new railway which directly connects the two islands is 6.7 kilometres, that of the tunnel being 3.6 kilometres. The length of the part of the tunnel which dives under sea is 1.2 kilometres. The tunnel has a diameter of 7 metres, and the construction of the new line and the tunnel will be completed by the spring of 1941.

Tourist Industry

Three organizations, viz., the Board of Tourist Industry, the Japan Tourist Bureau (founded in 1912), and the Kokusai Kanko Kyokai (founded in 1931), a foundation devoting itself solely to the carrying out of travel publicity abroad, and forming the hub from which radiate innumerable lines connecting it with other important organizations, such as the Society for International Cultural Relations and other cultural bodies, tourist associations in various districts, transportation concerns, hotels and all other organizations that have anything to do with the tourist industry of Japan.

The Board of Tourist Industry is divided into two departments, one for general affairs and the other for business promotion. In addition to these, it has three boards of investigation dealing with tourist resorts, hotel enterprises and treatment of tourists respectively. These boards comprise experts of the government and the public on the respective subjects. The Committee of Tourist Industry holds its general meeting at least once a year, when it decides what course to follow in carrying out any important undertaking.

The Kokusai Kanko Kyokai runs an office in New York and Los Angeles, though the actual business is carried on there in the popular name of the Japan Tourist Bureau.

The branch offices of the Japan Tourist Bureau, both in Japan and abroad, number about 130 in all. Besides, it has agents in some important cities abroad in order to make the network of its service as extensive and satisfactory as possible.

Since the establishment of the Board of Tourist Industry, tourist organizations of a non-commercial nature have been successively founded in many parts of Japan, and at present the total number is in the proximity of 400.

During the past two or three years, an annual increase of over 20 per cent has been recorded in the number of foreigners who visited Japan. According to statistics issued by the Board of

Digitized by Google

Tourist Industry, the year 1935 witnessed the entry into this country of 42,629 foreigners, not including the 2,700 passengers on ships making a world-cruise, 132,700 through passengers on ordinary boats and 500,000 members of the crews of various vessels which called at Japanese ports during the same year.

The total amount of money spent in 1935 in this country by foreigners was ¥96,019,000 of which ¥70,242,000 was spent by tourists, according to the estimate of the Ministry of Finance. During the same year, Japan exported cotton piecegoods to the amount of ¥490,000,000 raw silk to the amount of ¥380,000,000, rayon textiles to the amount of ¥120,000,000 and silk textiles to the amount of ¥77,000,000. It will be noted that the amount of money spent in this country by tourists came very near the value of the export of silk textiles.

The total number of foreigners visiting this country did not increase much in 1936 over the figures for the preceding year, but the same rate of increase as before was recorded in the number of those who travelled the country for sightseeing. Particularly noteworthy is the fact that a remarkable upward tendency was indicated in the number of tourists coming from Manchoukuo and other East Asiatic countries.

In consideration of the future of Japan's tourist industry, special mention must be made of the fact that elaborate preparations have already been commenced for holding the 12th Olympic Games in Tokyo in 1940 which will also be the 2,600th anniversary of the foundation of the Empire. Besides various national enterprises in connection with the celebration of the anniversary, international conferences in varied fields are also expected to be held in this country during that year.

It is rather difficult to form any idea as to the number of foreign visitors likely to visit Japan in 1940, but the Board of Tourist Industry and other organizations are looking for it as an epoch-making year in the history of tourist industry in Japan. The rate of increase of foreign visitors during the past 15 years, 1921–1935, has been 5 per cent per annum, and their number in 1940 will under ordinary circumstances reach 53,000, while the 12th Olympiad and some 10 international gatherings are bound to add several thousands to this number.

The governmental authorities and the civilian organizations concerned are energetically devising ways and means to promote the tourist industry in conformity with the exceedingly favourable situation. Apart from the question of perfecting sporting facilities and means of transportation, plans are under consideration for the improvement of roads, traffic, sanitation, hotels and amusement facilities. The establishment of an international sea-bathing resort has been proposed and some organizations are sponsoring the creation of better facilities for the study of Japanese culture, by means of museums, art galleries, etc.

FOREIGNERS WHO VISITED JAPAN

In 1936

Apart from the regular visitors mentioned above, there were 3,159 tourists who visited Japan on their way around the world, 142,445 callers on various

Digitized by Google

ports along Japanese shores and 515,-550 mariners who called at Japanese ports on their way while navigating their ships or cruisers.

The total amount of money spent by all the foreign visitors in Japan during the year is roughly estimated at ¥105,-567,000. This figure consists of ¥77,870,-000 spent by tourists, ¥5,412,000 by mariners aboard steamboats and cruisers visiting Japan, ¥2,309,000 by students studying in Japan, ¥9,769,000 involved in mission work ¥10,207,000 disbursed by foreign embassies, consulates and all the other public offices. These figures compared with those of the four preceding years are as under:

Item	1932	1933	1934	1935	1936
		(In yen)			
Money spent by tourists	37,649,000	46,301,000	64,598,000	70,242,000	77,870,000
Money spent by mariners	3,262,000	4,000,000	4,607,000	5,077,000	5,412,000

Money spent for mission work	9,801,000	11,653,000	12,082,000	11,310,000	9,769,000
Money disbursed by public offices	6,592,000	6,871,000	6,945,000	7,350,000	10,207,000
Total	57,158,000	69,458,000	89,232,000	96,019,000	105,567,000

Railways in Chosen, Taiwan, Manchuria, etc.

Chosen

The first railway enterprise in Chosen dates back to 1890, when a railway linking Kéijo (Seoul) with Jinsen (Chemulpo), 29.485 kilometres in length, was laid and opened to traffic by the Kéi-Jin Railway Company. The outbreak of the Russo-Japanese War caused the military authorities of Japan to build the Kéijo-Fusan, Kéijo-Shingishu and Masan lines which were opened to traffic in 1905 and 1906 respectively. In 1906 the Imperial Government of Japan nationalized the Kéijo-Fusan Line and also took over the Kéijo-Shingishu and the Masan Lines from the War Office of Japan, placing all these lines under direct control of the Railway Bureau of the Korean Residency-General. Meanwhile the work of construction was steadily pushed on and in 1910 the Héijo-Chinnampo line was completed. On the spanning of the Yalu River with a swing bridge in 1911 the peninsular railway was brought into connection with the South Manchuria Railway. In 1914 the Taiden-Mokpo and Kéijo-Gensan lines were completed, while in 1915 part of the Gensan-Kainéi line was opened. In 1928 the Kankyo line which connects Kainéi to Gensan was completed, and in 1933 the Tomon line which connects Kainéi to Yuki was opened to traffic. The latter is connected with the Keito line of S.M.R.C. at Kainéi, thus preparing a new eastern transportation facility between Chosen and Manchoukuo. On March 31, 1937, the State Lines in Chosen open to business totalled 3,575.9 km. as against 3,389.5 km. in 1936 showing an increase of 186.4 km. The number of passengers carried aggregated 33,708,178, while the weight of goods hauled was 9,980,227 metric tons. The coaching receipts amounted to ¥32,-143,327 and goods receipts to ¥32,892,731. As compared with the preceding year the number of passengers shows an increase of 4,363,990, and the volume of goods hauled an increase of 1,312,585 metric tons, while the coaching receipts increased by ¥3,970,856 and goods receipts by ¥4,587,305.

The aggregate length of private railways open to traffic at the end of 1937 amounted to 1,211.8 kilometres, the length of lines under construction 70.9 kilometres, and lines contemplated but not yet granted charters 228.6 kilometres, the total length of all these lines amounting to 1,415.6 kilometres. The number of private companies which are already operating railways in Chosen numbered 10, viz., Chosen Railway Company, Chosen Kéinan Railway Company, Kongosan Electric Railway Company, Shinko Railway Company, Chosen Kéito Railway Company, South Chosen Railway Company, Chosen Gas & Electric Company, South Manchurian Railway Company, Sennari Railway Company, and Kunsan Municipal Railway. Besides, there were two railway companies which were provided with a charter but had not begun work. Of the above mentioned companies the former five receive regular subsidies from the Government. The aggregate capital of the five subsidized companies amounts to ¥80,300,-000 of which ¥37,380,000 is paid up, while the total capital of 7 other non-

Digitized by Google

subsidized companies came to ¥21,206,000. The total length of tramways operated in Chosen came to 8.23 kilometres indicating a gain of 1.4 kilometres over the previous year. The power used is mostly electicity. (See Chapter XL for fuller information.)

Taiwan

It was not until the cession of the Island of Formosa (Taiwan) from the Chinese Government to Japan that the island began to enjoy railway facilities, for, prior to that time, the only railroad existing was a small light railway between Keelung and Shinchiku built at the time of the Ching Dynasty. Soon after the cession, the Taiwan Government-General brought forward a plan, with the approval of the Diet, to build a railway connecting Takao with Keelung at the expense of ¥28,800,000. Work was started in 1889 from both termini and finished in April, 1908. This line now forms the trunk line in the island's communication system. The construction of this pioneer line was followed by other lines, that is, the Kyukyodo-Heito section completed in 1912, the Taito line in 1917 and the Giran line in 1924. The length of lines open to traffic on March 31, 1938, was 881.7 kilometres, being the same as the preceding year. The working route kilometreage of the Government lines at the end to line in 1917 and the Giran line in the train kilometreage during the year 9,305,713 kilometres, the vehicle kilometreage 139,334,870 kilometres, being an increase of 336,988 kilometres for the train kilometreage and an decrease of 21,023,427 kilometres for other vehicles. The number of passengers carried came to 21,482,677 in 1936-37 and 23,098,052 in 1937-38, the volume of goods hauled to 7,121,691 metric tons in 1936-37 and 7,249,235 in 1937-38, and the earnings accruing from these two sources to ¥26,076,780 in 1936-37 and ¥27,019,079 in 1937-38.

Most of the private railways existing in Taiwan were originally constructed by sugar refining companies for transporting sugar and other materials, transportation business being conducted only as a side work. At the end of 1937, there were the total working km. of 2,515.4 and the number of passengers during 1937 was 4,196,773, while goods carried amounted to 842,155 metric tons. The earnings of the companies through the railway business amounted to ¥2,465,858.

The tramways, which form an important factor in the island communication system, have made a marked development in recent years. The total length of lines in operation on March 31, 1936, was 1,218.8 km., the number of passengers carried aggregated 3,257,635 goods moved 570,663,400 m.t. and the total receipts ¥1,601,235.

Karafuto Railway

The first railway in Karafuto (Japanese Saghalien) was constructed by the Military Department in 1906 between Otomari, formerly known as Korsakovsa, and Toyohara, formerly Vladimolocka, 41.83 km. in length. It was a light railway with a gauge of 0.61 metre and exclusively used for military purposes. With the withdrawal of the military Government in April, 1907, the railway was transferred to the control of the Karafuto Administration and opened to public traffic in August of the same year. As traffic went on increasing the gauge was widened to 1.07 metres, some time in 1910, while construction of sections further north of Toyohara was started. Late in 1911 the work on the Toyohara-Sakaehama section being completed, the Otomari-Sakaéhama section, 94.13 km. which now forms the trunk line in the island's communication, was opened to traffic. Construction work has been continued since and a branch line linking the Kawakami Mine with Konuma, and the Honto-Noda section on the west coast were completed and opened to business in 1914 and 1920 respectively. In addition, the construction of a branch line which connects Toyohara, the capital of the island, with Maoka on the west coast, was started in 1921 and opened to business in 1928.

The lines in operation at present totalled 342.9 kilometres, remaining the same as the previous year. The total number of passengers who travelled by the railways during 1935 totalled 1,606,325 and showed a increase of 205,843 or 14.7 per cent as compared with the previous year, and the receipts showed a gain of ¥117,012 the total receipts being ¥947,651. The total of both passenger and goods receipts amounted to ¥2,459,977 showing an increase of ¥401,519 over the receipts for the preceding year.

There are altogether three local railway companies that have run railway business in Karafuto.

South Manchuria Railway

It was on September 5, 1905, that the Japanese Government, by virtue of Article V of the Peace Treaty concluded between Japan and Russia, acquired possession of the railways in Manchuria from Changchun to Dalny, now Dairen, and Port Arthur, now Ryojun, to-

Digitized by Google

gether with its branch lines, all the rights, privileges, and property attaching thereto, including the local mines formerly owned by the Chinese Eastern Railway. On June 7, 1906, Imperial Ordinance No. 142 was issued concerning the establishment of the South Manchuria Railway Company and on July 13 of the same year General Viscount Gentaro Kodama was appointed chairman of the promoters' committee which were composed of 80 members. On July 25, 1906, the presidency was assumed by General Viscount Masataké Térauchi, the then Minister of War, due to the death of General Kodama. The articles of association relative to the company were prepared by the committee on the basis of the Imperial Ordinance and the instructions of the Government. They were approved by the Government on August 18 and the establishment of the company was sanctioned by the Minister of Communications on November 1, 1906. The authorized capital of the company at first was ¥200,000,000, of which ¥100,000,000 represented the total of the appraised value of railways with properties and the mines at Fushun and Yentai as handed over to the company by the Military Field Railway Department. The other half of the capitalization was offered to public subscription and the shareholders were guaranteed a 6 per cent dividend per annum by the Japanese Government. By March, 1930, 800,000 shares representing 80 million yen were paid up, but with the development of various activities after the World War the capitalization was increased to 440 million, one-half of the increased capitalization being taken up by the Japanese Government. In 1933, its authorised capital was again increased to ¥800,000,000. The company is authorized to issue debentures not exceeding twice the amount of paid-up capital, and not exceeding the amount of total capitalization. The company has often issued debentures on the home and foreign markets and on such occasions both the principal and interest have been guaranteed by the Government. The total capital paid up on March 31, 1936 amounted to ¥584,208,000 and the capital unpaid to ¥251,792,000. In 1937 the total length of lines open to business was 1,129.1 kilometres. The gauge of these lines was 1.067 metres at first, excepting the Mukden-Antung Line. The company shortly after its establishment rebuilt the lines to the standard gauge of 1.434 metres. The doubling of track between Dairen and Hsinking, 704.3 kilometres, was completed in 1915. In the year 1937 the number of passengers carried was 17,515,044 and showed an increase of 1,765,258 over the previous year. Goods carried aggregated 25,129,935 m.t. The income from these came to ¥151,053,018. (See Chapter on Manchoukuo.)

Motor Transport and Its Development

Behind Japan's motor transport system there is no such history of experimentation and endeavour as characterizes the arrival of the motor car in the West. The first car seen in Japan was one imported from America by a foreign resident of Yokohama in 1897, and then for the next ten years there was no great increase in the number. In 1907 there were only 16 cars in the whole country. Then came a change. In 1912 there were 520 vehicles and a year later 1,000. In 1921, passenger cars numbered 4,683 and business cars numbered 7,439. The great earthquake and fire which destroyed Tokyo and Yokohama in 1923 brought about a great demand for motor cars because rail traffic was interrupted at various places and the help of motor cars was badly needed. In 1924, the number increased to 40,070, of which 27,959 were passenger cars and 12,097 were trucks. The rate of increase for the five years 1921–26 for passenger cars was 100.49 per cent and for trucks 1,200.6 per cent. This rapid development of motor car transport has driven rikishas, electric cars and provincial railways into the background. Motor-car passengers are increasing year after year, while passenger receipts on provincial railways are quickly decreasing. To the present, except in the vicinity of large cities, Japan has not been blessed with good roads, but the construction of first-class motor roads is being pushed ahead in all parts of the country and traffic is bound to make a phenomenal increase as the roads are completed.

Motor-Bus Routes Granted Charters or Invalidated During the year under review the number of the private motor transportation carriers granted charters for opening motor-car service came to 414 with an aggregate length of 1,740.5 kilometres consisting of 444 for motor-bus, and of 7 for motor-truck service representing 1,628.5 km. and 112.4 km. respectively. The number of the motor-transportation carriers, whose charters were invalidated, came to 269

Digitized by Google

for motor-bus and 64 for motor-truck service, the aggregate length being 3,765.2 kilometres for the former and 2,224.3 kilometres for the latter.

Lines under Operation On March 31, 1937 the number of the private motor transportation carriers in operation came to 2,587 for the motor-bus service and 288 for the motor-truck service, their total length reaching 96,357.9 kilometres for the former and 11,024 kilometres for the latter.

Traffic Result The number of passengers carried by 2,123 motor-bus companies (or 75 per cent of the total carriers) was 1,011,242,330 yielding therefrom a receipt of ¥98,092,362 or ¥0.097 per passenger. The aggregate amount of goods moved by 85 motor-truck carriers figured 334,234 metric tons, the receipts accrued therefrom amounting to ¥1,533,831, i.e., ¥4.589 per metric ton. The number of accidents which took place on the motor routes operated by the aforesaid carriers was 12,821, in which 167 persons were killed and 1,875 injured.

Motor-Buses and Trucks The aggregate number of motor-buses and trucks in operation on all the private motor routes at the end of the year under review was 23,630 of motor-buses and 624 of motor-trucks.

Financial Result According to investigation made into 2,208 private motor-car companies as explained elsewhere, their total working revenue of these companies during the year aggregated ¥104,356,900 and their total working expenses ¥91,457,507, leaving a profit of ¥12,899,93. The percentage of the working expenses to the working revenue stood at 87.6 per cent and that of the working profit to the construction expenses at 11.4 per cent.

Assets and Liabilities The aggregate capital of 283 private motor-car companies, which defrayed expenditure required for starting the motor service amounting to more than ¥50,000, came to ¥876,520,308, of which ¥139,287,320 was unpaid. The expenditure required for the motor routes in operation totalled ¥84,884,471.

Staff On March 31, 1937 the staff of the employees of 2,209 private motor transportation carriers numbered 75,071.

Number of Cars According to the statistics taken by the Police Bureau, Home Ministry, the number of all kinds of cars in Japan proper was 194,574 at the end of 1936.

NUMBER OF MOTOR CARS IN JAPAN PROPER

At the end of	Ordinary Cars		Trucks	Special Cars	Small Cars	Total
	Private	Taxicabs				
1933	7,723	59,010	38,199	5,187	25,124	135,234
1934	7,970	62,511	42,059	4,938	39,095	156,573
1935	9,213	64,795	46,918	5,065	49,913	175,904
1936	— 74,910 —		51,338	4,978	63,348	194,574

Number of Cars in Principal Prefectures in 1936

	Ordinary Cars	Trucks	Special Cars	Small Cars	Total
Tokyo	17,991	10,905	1,095	16,347	46,338

Aviation

History of Development

The Early Period During the Satsuma Rebellion in 1877, two balloons were built. In 1891, Mr. Chuhachi Ninomiya made a model of an aeroplane shaped like a bird from his own design, and, in 1894, another shaped like an insect. In 1897, Mr. Isaburo Yamada obtained a patent for a kite balloon of his own invention. Two of these kite balloons were used in the siege of Port Arthur during the Russo-Japanese War. In 1907, a balloon corps was organized in the Telegraph Corps at Nakano, and, in June, 1909, a special military balloon investigation association was established. In March, 1910, a gliding test of aero-

Digitized by Google

plane No. 1 of the Hino type was made at Toyamagahara, Tokyo, and, in October that year, a flying test of an aeroplane of the Narahara type was made. On December 19 of the same year, Lieutenant Tokugawa (now Lieutenant-General) flew 3,000 metres in four minutes in a Farman aeroplane at Yoyogi, and Captain Hino flew in a Glady aeroplane. This was the first time that an aeroplane flight was carried out in Japan.

The First Civilian Flight In the spring of 1911, airship No. 2 of the Yamada type was taken out of the hangar at Osaki, Tokyo, and made a successful cross-country flight. In March and April of the same year, an American flyer carried out an exhibition flight in Osaka and Tokyo; on April 8, Mr. Shinzo Morita, who had studied flying in France, flew in a 45 h.p. monoplane over the Joto parade-ground in Osaka, this being the first flight by a civilian flyer in this country; and, in April that year, the aerodrome and flying ground at Tokorozawa were completed. In June, 1912, Mr. Atwater, an American flyer, conducted a series of exhibition flights by hydroplane on the sea off Nishinomiya near Osaka; and, in July that year, five officers were selected from each army division to be trained as flying officers. This marks the beginning of instruction in flying to military officers in this country. In the autumn of 1912, a number of aeroplanes and airships participated in the grand military manœuvres. In February, 1913, the Téikoku Hiko Kyokai (Imperial Aeronautical Association) was established; on May 4 that year, Mr. Koha Takéishi, a civilian flyer, started on a Naruo-Osaka-Kyoto flight, but, when landing in the Fukakusa parade-ground in Kyoto, he met with disaster and died as the first victim of civilian aviation in Japan.

Contest of Civilian Aviators In 1914, a contest by civilian aviators was held at Naruo, near Osaka, under the auspices of the Imperial Aeronautical Association, and, during the Tsingtao campaign Japanese military aeroplanes took part in actual fighting for the first time and displayed their ability in scouting, in bombing the enemy fortress and in an aerial combat with enemy planes. In 1915, a meet of civilian flyers was held in Osaka, and a military flying battalion was formed. Between January and April, 1916, American aviators visited Japan and performed stunt flying at Naruo and other places; and, on April 27 that year, night flying was successfully carried out for the first time in this country. In 1917, the flying battalion was enlarged into the first and second battalions and a balloon corps. In April that year, Mr. Art Smith, an American flyer, again visited Japan and carried out a series of high-class exhibition flights in Osaka and Tokyo. In April, 1918, Mr. Masao Goto, a private flyer, succeeded in making a non-stop flight between Tokorozawa and Osaka for the first time.

Military Flying School In April, 1919, the Military Aeronautical Department and the Military Flying School were established; and, on October 22 that year, the first mail transport flight between Tokyo and Osaka was carried out with success. In 1920, the Aeronautical Institute was established at Tsukishima, Tokyo; and in May that year, two Italian aviators paid a visit to Japan by air. In March, 1921, the regulations for the control of aviation were put in force. In the autumn of 1922, the Japan Aerial Transport Institute started a regular flying service between Sakai and Shikoku by hydroplanes. In 1923, the military air force was made an independent arm. The Osaka Asahi Shimbun started a regular air service between Tokyo and Osaka in January and the Japan Aerial Navigation Co., Ltd., opened one between Osaka and Beppu in July that year. In March, 1924, the dirigible S. S. No. 3 exploded and, in September of that year, the trial flight of the newly built airship Astra was carried out.

Air Mail Traffic In April, 1925, air mail traffic was started between Tokyo and Osaka; and, on July 25 that year, an aeroplane of the Asahi Shimbun took off from the Yoyogi parade-ground in Tokyo and, on October 27, reached Rome after a flight of 16,000 kilometres (in stages) via Moscow, Paris and London. In 1926, the Japanese Navy purchased from Italy the dirigible S-No. 3, which was one with a semi-rigid envelope, introduced into Japan for the first time. In June, 1927, the Aviation Law came into effect. In May, the Coast Defence Association successfully carried out a flight round the mainland, and, in October that year, the airship S-No. 3 exploded, while participating in the grand naval manœuvres. In April, 1928, Mr. Habuto, a civilian aviator, established a new record by flying 2,000 kilometres in 13 hours and 23 minutes; and, in July that year, aerial defence manœuvres were conducted in Osaka.

The Air Transport Co.. In 1929, the Japan Air Transport Co., Ltd., was es-

Digitized by Google

tablished and inaugurated a regular air passenger service between Tokyo, Osaka and Fukuoka, later extending it to Seoul and Dairen; and two Army scouting planes of the 88 type flew between Tachiarai and Héito without stopping, making a record of aerial connection between the mainland and Taiwan. On their homeward flight, one of the planes flew for 15 hours and 15 minutes, thus establishing a new record of staying in the air in this country. In 1930, the Japan Students' Aviation League was formed and associations for the study of aviation were established one after another in different universities and colleges in Tokyo and Osaka. Mr. Yoshihara, a civilian flyer, flew from Berlin to Tokyo via Siberia in 11 days and simultaneously, Mr. Azuma, also a civilian flyer, reached Tokyo from Los Angeles via New York, London, Berlin and Siberia. In March, 1931, the airship No. 8 which had been made in Japan and belonged to the naval air force at Kasumigaura took off and stayed in the air for a record length of time of 60 hours and one minute.

In May, the Aeronautical Institute which ranks as the best research station in the world was completed six years after the starting of its construction. In the same month, the aeroplane "Young Japan" belonging to Hosei University, a member of the Students' Aviation League, set off for Europe from the flying ground at Hanéda near Tokyo and, at the end of August, reached its destination, Rome. After the outbreak of the Manchurian trouble in September that year, our military planes participated in actual warfare for the first time since the Tsingtao campaign. In October of the same year, the aeroplane (Fokker No. 3-M) of the Japan Air Transport Company succeeded in flying between Taiwan and the mainland. In 1932, as a consequence of the Manchurian trouble, 64 "Aikoku" (Patriotic) planes were constructed with money contributed by the people generally, and, moreover, defence from aerial attack became much discussed in our principal cities and important economic centres.

Present Condition of Civil Aviation

Modest but definite progress of commercial aviation in Japan is indicated in the annual report of the Japan Air Transport Company, which reports, for 1938, the length of air routes 6,925 km., number of flights 9,205, the aggregate distance of flights 2,856,262 km., passengers carried 18,955, mail matter 354,641 kg. and goods 80,116 kg. Commencing with April 1, 1935, the company has resumed night flying and also has inaugurated a special early morning service bringing Mukden within a day's reach from Tokyo by way of Seoul and Dairen. The early morning service was extended to Hsinking, the capital of Manchoukuo, on May 1. Further expansion of commercial aviation is expected to be facilitated considerably by the 15-year Government subsidy plan adopted by the Communications Ministry last year with a tentative budget of ¥200,000,000 for the whole period and originally a sum of ¥5,500,000 for the 1935–36 year but later cut to a smaller amount. Of the other aviation concerns Japan Aviation Research Institute maintains a 290-kilometre service between Osaka and Matsuyama in Shikoku, by way of Takamatsu; the Tokyo Air Transport Company a 150-kilometre service between Tokyo and Shimoda; the Tokyo Asahi Shimbunsha, Ltd., a 415-kilometre service between Tokyo and Niigata; and the Japan Sea Air Transport Company, a newly opened service between Matsué, Shimané Prefecture, and Hirosaki on the Japan Sea coast. The Tokyo-Shimoda service is operated only between May and September and the Tokyo-Niigata service between May and October.

The Japan Airways Company Under the auspices of the Ministry of Communications a new airway company was incorporated on December 1, 1938, through a merger between the Japan Air Transport Company and the International Air Transportation Company. It is called the Dai Nippon Kōkū Kabushiki Kaisha or the Japan Airways Company. The establishment of the company was contemplated by the Ministry of Communications for the development of civil aviation in 1938 and the merger of the two companies was the first step for the realization of a monopolistic half-governmental airway company. The Bill for the establishment of the Japan Airways Company was prepared by the Ministry and submitted to the Imperial Diet. Through the adoptation of the bill by the 74th session which met in the early months of 1939, the Japan Airways Company's capitalization was fixed at ¥100,000,000. The company has the right of monopolizing the national and international civil airway transportation business of the country, receiving subsidies from the National Treasury and is authorized to issue debentures not exceeding twice the amount of paid-up capital.

Digitized by Google

Of the total amount of the capital, ¥37,250,000 shall be invested by the Government in cash and fixed assets; the number of shares shall be 510,000 (face value ¥50) representing ¥25,500,000, the amount to be paid-up being ¥17,625,000 according to the provisions of the law and the Imperial Ordinance for the establishment of the company.

All the air routes extending over 300 kilometres shall be monopolized by the new company and consequently the Japan Aviation Research Institute will be merged into the new company, while Ando Aeronautical Institute, the Japan Sea Air Transport Company and the Tokyo Air Transport Company shall be left untouched as local air companies.

Two goodwill flights to foreign countries were carried out by the Japan Airways Company.

The first flight to Siam, over a distance of approximately 5,000 kilometres, was conducted by the company's Heinkel plane, the Nogi, which left Tachikawa airport on January 25, at 6:44 o'clock in the morning. The plane took off from Taihoku, capital of Formosa, the following morning and arrived at Bangkok at 5:25 o'clock (Japan time) the same afternoon. The plane departed from Bangkok at 10 o'clock on the night of February 4 and, after an hour's rest at Taihoku, returned to Tachikawa at 4:52 o'clock in the afternoon of the following day. The second flight to Iran was made at the Government's request in order to demonstrate Japan's goodwill and friendship on the occasion of the Royal marriage of the Crown Prince of Iran. The company's Soyokaze left Tokyo on April 9 and arrived at Teheran at 4:20 o'clock (Japan time) on the afternoon of April 15, covering a distance of 12,061 kilometres in 46 hours and 50 minutes. The plane returned to Tokyo on the afternoon of May 28.

Another noteworthy achievement in Japanese civil aviation during 1938 was a new world record for distance over a closed circuit and for average speed established by a large long-distance plane designed by the Imperial University Aeronautical Research Institute. This machine, piloted by two of the army's late best fliers, Major Fujita and Sergeant Takahashi, took off from Kisarazu at 4:55 o'clock on the morning of May 13 and began its flight over a quadrangular course of 401.759 kilometres connecting Kisarazu, Choshi, Ota and Hiratsuka. It completed 29 laps and landed at Kisarazu at 7:18 o'clock in the evening of May 15 after remaining in continuous flight for 62 hours, 22 minutes and 49 seconds. When it had landed, the plane still contained about 500 litres of fuel and 200 litres of oil, which would have been sufficient to continue the flight for another 1,200 kilometres.

The present major air routes in Japan are Tokyo—Dairen, Fukuoka—Taihoku, Tokyo—Sapporo, Tokyo—Hsinking, Tokyo — Peking, Fukuoka — Nanking and Tokyo—Palau, the last three being opened in 1938 and 1939. The aggregate length of the routes extends as long as 19,000 kilometres. As compared with the conditions in 1929 the length of routes extends 7 times as long in 1938, the length of flights 6 times, the number of passengers carried 31 times, the volume of mail matter conveyed 100 times, and that of goods 125 times, as it is shown in the following table:

GROWTH OF CIVIL AVIATION

(Compiled by the Aviation Bureau, Communications Ministry)

	Length of Routes (In km.)	Number of Flights	Aggregate Length of Flights (In km.)	Number of Passengers carried	Goods conveyed (In kg.)	Mail Matter conveyed (In kg.)
1929-30	2,575	2,558	1,020,300	2,755	2,444	8,594
1930-31	2,575	4,454	1,670,900	7,642	8,966	25,063
1931-32	2,575	4,867	1,753,230	6,766	32,414	40,871
1932-33	2,575	5,301	1,744,105	10,716	28,510	93,950
1933-34	2,575	5,224	1,715,400	10,992	28,049	219,560
1934-35	2,618	5,648	1,683,652	12,187	51,023	197,199
1935-36	4,228	5,846	1,833,056	10,822	67,497	263,960
1936-37	6,925	9,205	2,856,262	18,955	80,116	354,641
1937-38	10,306	16,270	5,126,385	47,342	248,607	591,158
1938-39	15,335	17,144	6,209,873	69,268	297,807	819,261

Note: The figures are for the routes now taken up by the Japan Airways Company.

Measures to Promote the Aviation Service

Profoundly convinced of the absolute necessity of promoting aviation service under existing conditions the Ministry of Communications intends to make it a national policy to launch a comprehensive aviation programme extending over three years beginning with the fiscal year of 1937–38. This programme covers the perfection and expansion of aviation facilities, training of aviators, encouragement and control of aircraft industry, perfection of both national and international aviation systems, etc.

Perfection and Expansion of Aviation Facilities The aviation facilities of this nation, including aerodromes, grounds for forced landing, aeronautical wireless stations, aerial lighthouses and aviation meteorological observatories, are in such condition that they are far from bearing a favourable comparison with those in various other countries. There are at present less than 10 state-managed flying grounds for civilian aeroplanes in this country, which are all too small and poorly equipped. Even the Tokyo airport, in spite of its being located at the entrance to the capital, is not large enough to enable the easy landing of a large-sized passenger plane such as the Douglas machine which traverses the American Continent.

As a means of rectifying the unsatisfactory situation, the authorities of the Ministry of Communications are endeavouring to perfect the national aviation system through the improvement of existing aviation fields and establishment of new ones in the leading cities throughout the country with the cooperation of the prefectures concerned. They are also making efforts to increase the number of grounds for forced landing and improve and expand the aerial lighthouses and other facilities in order to promote the regular air service. In 1939, the work for enlarging Fukuoka Airport was commenced, while improvements in Tokyo Airport (Haneda) and the costruction of Minami Sunamachi Airport in Tokyo are carried on.

Training of Aviators While the necessity of training air pilots and aircraft mechanics in order to promote the aviation service is generally recognized, the institutes for such training in this country are still very poorly organized and have few adequate training grounds. To make matters worse, the aeroplanes used by these institutes for exercise purposes are generally of a very inferior quality.

The communications authorities are working for an increase in the number of superior aviators by controlling these training institutes and urging an improvement of their equipments. During 1938-39, 10 Local Aviators' Institutes are going to be established at important points in the country for the training of aviators and technicians, and the Central Aviators' Institute will be established at Matsudo near Tokyo for a complete training of the graduates of the local institutes, the number of students limited to 50 picked up ones.

Encouragement and Control of the Aircraft Industry From the standpoint of science and technique, the Japanese people are not inferior to any other in producing aircraft of superior order but owing to the smallness of demand for civilian aeroplanes, few efforts have been made to manufacture flying machines of new types. Though some new types have been produced in the country they are chiefly imitations of foreign-made ones. The expensiveness of the production of an original type is held responsible for the slowness in the progress of aircraft industry in the nation. The government authorities are considering measures to encourage the manufacture of experimental aircraft, besides undertaking to direct the aircraft-making activities through its aeronautical research institutes. They aim at enabling the manufacture of aircraft at less cost than at present, so as to increase the demand for aeroplanes. The authorities also deem it essential to control as well as give encouragement to the manufacturers of aeroplanes and makers of aeroplane parts. The leading newspaper publishers in the country are encouraged by means of special grants to buy home-made aeroplanes instead of imported machines for use in their business. As an additional means of encouraging aircraft industry, the authorities also feel the necessity of granting subventions for the promotion of the export trade of home-made aircraft.

International Aviation Besides perfecting the national aviation system by improving the existing facilities and creating new ones, it is being strongly urged that the air routes linking this land with other countries should be perfected and expanded. It is emphasized that this country should gain the mastery of a regular air line connecting Manchoukuo, China and Europe, another connecting India, the South Sea Islands and Australia, a third connecting Soviet Russia and a fourth connecting the United States of America.

Digitized by Google

Though the difficulty of competing with the already extended influence in the East of America and Europe is conceded, yet such a mastery is deemed essential to the growth of this nation.

Promotion of the Aircraft Industry With a view to furthering the development of the aircraft industry of the country, the Aircraft Manufacturing Industry Law was promulgated in 1938. By the operation of the law the present 14 aircraft manufacturing companies are to be helped by subsidies in enlarging their equipment, new companies are going to be established in this year, and the Central Aviation Institute was established on April 1, 1939. This new Institute belongs to the Communications Ministry and commenced investigations on a high-speed aircraft, the manufacture of larger planes, and a greater production of superior planes.

CHAPTER XXVI

SEA TRANSPORTATION

Historical Background

The dawn of Japan's history is associated with maritime activities. The national mythology is rich in stories of sea adventures. Later authentic records fully demonstrate the energy and spirit of the early Japanese, who had to fight their way through stormy seas in the primitive craft of those days. The period covered by the latter half of the sixteenth and the beginning of the seventeenth century marks the golden age of marine activity in Old Japan. This was in a great measure due to the stimulus received by the natives through the appearance of Portuguese and other foreign ships in Japanese waters. Japanese vessels not only were in evidence in South China and the South Sea Islands, but cruised the Pacific as far as Mexico and fought their way through the Indian Ocean and round the Cape of Good Hope to Europe. Military rulers encouraged maritime enterprises and many large vessels were built. Thus the shipping trade between Japan and the South Seas and India, carried on under letters patent and numbering no less than two hundred ships at one time, engaged in commerce with twenty different countries, which were eventually dotted with regular Japanese colonies.

Ban on Shipping Activities Unfortunately, while the maritime prosperity of Japan was thus making progress by leaps and bounds, the Tokugawa Shogunate took the drastic measure of secluding the country and forbidding all foreign intercourse. Its first act was to place a strict ban on the propagation of Christianity in 1613. Subsequently, in 1634, all commercial relations with foreign countries were stopped, and in 1636 the construction of large ocean-going vessels was forbidden. For a period of more than two centuries thereafter the ocean trade of Japan was forcibly suspended.

The Well-timed Visit Commodore Perry's visit in 1853 was opportune, inasmuch as by this time many Japanese amongst the intelligent classes were dimly aware of conditions outside Japan, and the Shogun's Government, amid much confusion of opinion, took a firm step and signed the treaty. This event was followed in 1854 by the conclusion of similar treaties with the leading nations of Europe. Commercial intercourse with foreign countries was thus resumed, and the time-worn restrictions on navigation and ship-building were withdrawn. Then was formed the nucleus of the present mercantile marine of Japan. The Shogun's Government, finding the old Japanese methods of ship-building and navigation utterly out-of-date, promptly decided upon introducing the ideas of the outside world. For this purpose, students were sent abroad, while foreign experts were engaged to work in Japan. A ship-building yard was established in Yokosuka, and a naval school in Nagasaki.

After the Meiji Restoration

The First Steamship Co. In the third year of Meiji the Government promulgated the Mercantile Marine Regulations. In the same year, the pioneer steamship concern was inaugurated and a new leaf in the history of the Japanese mercantile marine was turned. The first company to be incorporated was the Kwaiso Kaisha, or Forwarding and Transport Company, which was later re-named the Teikoku Yusen Joki Kaisha (Imperial Mail Steamship Co.). Mampei Kimura was one of the chief promoters. A regular service was maintained between Tokyo and Yokohama and between Osaka and Kobé. Yataro Iwasaki, founder of the Mitsubishi interests, incorporated a shipping company called the Tsukumo Shokai, later renamed the Mitsubishi Shokai, in 1870 and inaugurated a regular passenger service between Tokyo and Kochi in Shikoku, from which place Iwasaki hailed. Three steamers formerly owned by Lord Yamanouchi, former feudal lord of Tosa, were employed in the service. When the Japanese Government sent a punitive force against Formosa in 1874, all foreign steamship companies interested in the Far Eastern shipping trade declared neutrality and rejected the Government's offer to charter their ships. Perplexed at this, the Government ordered the Mitsubishi Shokai and Teikoku Joki to offer their ships, and thus the transportation of troops was

Digitized by Google

smoothly effected.

The N. Y. K. Comes into Existence Shigenobu Okuma, then Minister of Finance, and Toshimichi Okubo, then Home Minister, made efforts to organize the Yubin Kisen Mitsubishi Kaisha after the termination of the expedition. The two above-mentioned firms were dissolved and the Government's ships were handed over to the new company. The Mitsubishi interests made large profits under Government protection. Kaoru Inouyé and Admiral Tsugumichi Saigo, who were Okuma's political opponents, organized a corporation to rival the Mitsubishi's as a means of overthrowing Okuma and ordered, in 1882, Eiichi Shibusawa, Takashi Masuda and others to form a semi-Government shipping company under the name of the Kyodo Unyu Kaisha. Keen competition later ensued between the two and threatened to lead them to ruin. Consequently, the Government ordered them to effect a merger. In 1885 the Nippon Yusen Kaisha was incorporated through the investment of ¥5,000,000 by the Mitsubishi and ¥6,000,000 by the Kyodo Unyu. At the time of founding, the company owned 58 steamers with an aggregate of 68,700 tons. The Pacific Mail Steamship Company of America was then operating a regular line between Yokohama and Shanghai with the s. s. Golden Age, the Costa Rica and two other ships, all of which were purchased by the Japanese Government in 1874 for the transportation of Japanese soldiers on the expedition to Formosa. Iwasaki waged a freight war with the Pacific Mail at that time and finally purchased these four ships for $8,000,000. This price included the Shanghai wharf now owned by the Nippon Yusen Kaisha at Whampoo.

The O. S. K. About this time the Osaka Shosen Kaisha was established in Osaka. It was then a small concern maintaining services in the Inland Sea of Japan, but later developed into a large company. The Nippon Yusen Kaisha, while maintaining the services originally inaugurated by its predecessors, opened new lines to Korea and North China, and one between Shanghai and Vladivostok; and in 1891, it inaugurated the service between Kobé and Manila and commenced to despatch occasional ships to Australia. In 1892, the N. Y. K. Japan-Bombay service was opened, the first regular Japanese steamship connection with a far-away foreign country. The rapid progress of Japanese shipping is attested by the fact that in the beginning of 1891 the total tonnage owned in Japan was 100,000, and one year later this figure had increased by 10,000.

The Sino-Japanese War During the Sino-Japanese War of 1894-5, when the greater part of Japanese shipping space was requisitioned for transport purposes, a large number of steamers were purchased or chartered by Japanese owners and Japan, having complete command of the sea, was able to maintain its established oversea services. At the close of the war Japan found that its merchant marine had grown by 100 per cent compared with the pre-war figures. Meanwhile the Nippon Yusen Kaisha lost no time in consolidating its established lines and in 1896 it inaugurated three trunk lines, viz., the Yokohama-London-Antwerp line, the Hongkong-Japan-Seattle line and the Yokohama-Manila-Australia line. In 1898 the Tokyo Kisen Kaisha was established, and it maintained a regular fast service between Hongkong and San Francisco via Japanese ports with three fine new passenger ships. The Osaka Shosen Kaisha opened a new line on the Yangtzekiang in 1898. In the following year, this company opened a line from Formosa to Hongkong, via Amoy and Swatow. The increase in Japanese tonnage at that time was remarkable. Whereas, at the end of 1897, it amounted to only 270,000 tons, it suddenly increased at the end of 1898 to 477,000 tons, the ratio of growth continuing, until the gross tonnage of steamers of 1,000 tons and over at the end of 1903 amounted to 521,000.

Foreigners' Services Mention must not be omitted of the valuable contribution made by foreign experts to the development of the Japanese mercantile marine. Through the remarkable foresight of Iwasaki, not only foreign captains, officers, engineers and pursers were freely engaged afloat, but numerous experts,business and technical, were employed on shore to conduct the business of the Nippon Yusen Kaisha. A large number of these foreigners remained in the company's service for a considerable time after its formation. Foremost among them were A. R. Brown, Alexander Macmillan, T. H. James, J. W. Ekstrand, W. H. Hasewell and Hector Frazer, whose names are still familiar to old timers in the Far Eastern shipping trade.

One noteworthy fact in connection with the development of the shipping business is the advance made by Japanese mariners. Japan imported the science of navigation from the West and early in the Meiji Era the captains, chief engineers and mates were mostly

Digitized by Google

foreigners. When the Nippon Yusen Kaisha was first organized in 1884 the company owned 57 steamers with a total tonnage of 60,000 and employed about 174 foreigners, the number being increased to 224 during the Sino-Japanese War. During the Russo-Japanese War Japanese mariners were the recipients of much praise, and their credit was greatly raised. After the war, in 1907, the number of foreigners was reduced to 87 and by 1920 there was not a single foreign officer in a Japanese ship.

The Russo-Japanese War The Russo-Japanese War broke out early in 1904, and Japan found herself compelled to undertake transport work of the biggest magnitude ever known in her history. This situation naturally created the necessity of purchasing additional tonnage, with the result that at the end of 1906 the total merchant marine reached a little more than one million gross tons, and Japan thus ranked sixth among the great maritime Powers of the world. Through the expansion of trade after the war, sufficient employment was found for these steamers. The Tokyo Kisen Kaisha opened its South American service before the war terminated. The Osaka Shosen Kaisha started in 1909 its Far East-Puget Sound service. Elsewhere the expansion was also pronounced, for in 1907 four large Japanese companies trading on the Yangtze-kiang pooled their interests and formed the Nisshin Kisen Kaisha (Japan-China Steamship Company) and the Osaka Shosen Kaisha in the meantime inaugurated the Tsuruga-Vladivostok and the Osaka-Kobé-Moji-Dairen lines. The general slump in the shipping trade which prevailed all over the world during this period was felt in Japan, but the country was not so badly hit as to prevent the further growth of its shipping, for, at the end of the year when the World War broke out, the total gross tonnage of ships flying the Japanese flag was 1,590,000, of which 1,310,000 tons represented ships of more than 1,000 gross tons each. Turning to the share which Japanese merchant shipping contributed to its foreign commerce, it was found that, whereas, prior to the Sino-Japanese war (1894–5), only 10 per cent of inports and exports were carried by Japanese ships, the proportion increased to 40 per cent after the Russo-Japanese War (1904–5), and just before the commencement of the World War, it had grown to 48 per cent.

The World War An extensive dearth of tonnage and the consequent pressing demand for space all over the world, caused by the World War, created a unique situation for Japanese merchant shipping, so much so that the total gross tonnage suddenly swelled by a million tons within a brief period and the yearly shipbuilding capacity increased from 50,000 tons to a half million gross tons. The share contributed by Japanese vessels to the transportation of imports and exports increased to nearly 80 per cent, the remaining 20 per cent being carried by foreign ships. Many new shipping services to all corners of the globe were opened one after another, and, besides rendering distinguished service to the cause of the Allies, the Japanese mercantile marine maintained a regular fortnightly Japan-England mail service, and despatched extra ships to European waters during the war. Furthermore, in response to the call of the United States after that country participated in the War a group of Japanese shipowners delivered a number of steamers aggregating 150,000 tons to the United States Government on charter at rates considerably lower than those which shipowners at that time could have obtained in the open market.

The inevitable aftermath of the war abnormalities—shipping depression—set in early in 1920, and this is still being felt all over the world. Japanese shipping in common with that of all other nations is undergoing a severe test of its perseverance and fortitude. Despite this Japanese shipping has considerably increased. The Tokyo Kisen Kaisha transferred all of its Pacific ships to the Nippon Yusen Kaisha, by which the latter became one of the greatest shipping companies of the world.

Representative Shipping Companies There are nine steamship companies working overseas and domestic services under governmental subsidy. These concerns are the Nippon Yusen Kaisha, the Osaka Shosen Kaisha, the Nisshin Kisen Kaisha, the Nanyo Kaiun Kaisha, the Kinkai Yusen Kaisha, the Yamashita Kisen Kaisha, the Kita Nippon Kisen Kaisha, the Harada Kisen Kaisha and the Kuribayashi Shosen Kaisha. The subsidy is paid to these companies for a period of one year from April to March in most cases, while in certain cases the subsidy runs over a period of three years.

The N.Y.K. Yokohama-London service has Kobé, Shanghai, Honkong, Singapore, Colombo, Suez, Port Said and Marseilles as intermediate ports of call. Its San Francisco line has Honolulu as the only intermediate port of

Digitized by Google

call on both outward and homeward (eastward-bound) trips. On the westward-bound trip it has Nagasaki, Shanghai, and Hongkong. The company's Yokohama - Seattle (eastward - bound) service has Victoria or Vancouver as ports of call and its westward-bound service has Kobé, Moji and Shanghai as ports of call. Its South American West Coast line between Yokohama and Valparaiso (eastward-bound) has Hololulu, Manzanillo, or Salina Cruz, Callao and Iquique as ports of call and its westward-bound line has as ports of call Kobé, Moji and Hongkong. The N.Y.K. Yokohama-Melbourne service has as ports of call Kobé, Nagasaki, Hongkong, Manila, Davao, Thursday Island, Brisbane and Sydney both ways. The company had, in April 1938, 90 vessels with an aggregate tonnage of 657,000 tons. The number of ships under construction and proposed was 20 with 214,500 tons; it is capitalized at ¥92,250,000 paid up and the rate of profit was 32.7 and rate of dividend 7.0 for the second half of 1937.

The O. S. K. South American East Coast line (Yokohama-Buenos Aires) for its outward bound trip has as ports of call Kobé, Nagasaki, Hongkong, Singapore, Cape Town, Rio de Janeiro and Santos. When homeward bound the line has Santos, Rio de Janeiro and Cristobal as ports of call. The O. S. K. African East Coast line operates between Kobé and Cape Town and on its outward bound trip has Moji, Hongkong, Singapore, Colombo, Mombasa, Zanzibar, Dar-Es-Salaam, Beira, Loureço Marques and Durban. When homeward bound the line has Durban, Lourenço Marques, Mombasa, Zanzibar, Singapore and Moji as ports of call. These are the most important steamship lines operated under Government subsidy. The company owned, in April 1938, 120 vessels with 534,0000 tons. It is capitalized at ¥62,500,000 paid up and the rate of profit for the second half of 1937 was 49.5 and that of dividend 6.0.

The Kokusai Kisen Kaisha, owner of motor and steam vessels aggregating 320,000 tons deadweight, has reached new heights of prosperity under the able management of Mr. S. Kurokawa, President, the net profit for the year ending December 31, 1937, having amounted to over ¥11,530,000. During the last few years nine speedy motor vessels have been built and placed in commission on the Orient-New York express service, whilst three 19-knotters were completed early in 1936. The latter have been allocated to the newly inaugurated Far East-North Europe fast service. Furthermore, three motor and turbine super-freighters of about 9,200 tons deadweight each are now on order with the shipbuilders here in Japan and will all be completed before the end of the year 1938. The Kokusai Line, which was mainly engaged in tramp shipping before, now maintains several regular services of international significance, thus contributing much towards Japan's balance of foreign payments, which fact is worthy of particular mention at this moment when the importance of invisible exports cannot be too heavily stressed.

In addition, the Nanyo Kaiun Kaisha operates under Government subsidy the South Sea line between Kobé and Sourabaya, Java, calling at Macassar, Sourabaya, Samarang and Batavia on the outward trip. Ships sail direct for Kobé on the homeward trip. The Nisshin Kisen Kaisha operates the China Coast line between Shanghai and Canton as the southern line and between Shanghai and Tientsin or Taku as the northern line. The company also maintains the Shanghai-Hankow line with Chenkiang and Nanking as ports of call, the Hankow-Ichang line with Shasi as port of call, the Hankow-Hsiangtan line with Changsha as port of call, Hankow-Changteh line, and the Ichang-Chungching line, all these five lines being known as the Yangtze River services.

The Kinkai Yusen Kaisha, affiliated with the Nippon Yusen Kaisha, operates a subsidized regular service between Kobé and Tientsin or Taku during the winter with Moji as port of call and also the Yokohama-Newchwang (Yingkow) service with Nagoya as port of call both under Government subsidy. It also runs a regular service between Hakodaté and Odomari in Karafuto. The N. Y. K., O.S.K. and Harada Kisen Kaisha jointly maintain a Kobé-Tsingtao regular steamer service. The Tsuruga-Viladivostok regular service is operated by the Kita Nippon Kisen Kaisha, which is affiliated with the Osaka Shosen Kaisha. The Kuribayashi Shosen Kaisha, Hokkaido, operates a regular service between Hakodaté and Petropavlovsk in Kamchatka seven times a year during the warm season. Stores and other supplies of daily necessity are carried by ships on the service for Japanese fishermen engaged in the Kamchatka fisheries. A regular connecting service between Aomori and Muroran is maintained by the Kita Nippon.

Nippon Yusen Kaisha regular liners sailing between Japan and Europe call on their outward trips at Istanbul and Beirut more than twice every three

Digitized by Google

month, those sailing between the same places call on their outward and homeward trips at Piraeus more than twice every three months, and those sailing between Japan and the United States call on their homeward trips at Havana in Cuba once every two months, all under Government subsidy.

The Toyo Kisen Kaisha owned 15 vessels with 78,700 tons in April 1937, with paid-up capital ¥9,000,000, rate of profit, for the second half of 1937, 32.7 and that of dividend 7.0. The total tonnage of ships under its control reached 121,277 tons.

The Dairen Kisen Kaisha had 52 vessels with 200,000 tons (9 vessels under construction), in April 1938, with paid-up capital ¥14,450,000, rate of profit for the first half of 1937 was 43.1 and that of dividend 6.0.

The Kuribayashi Shosen Kaisha had 22 vessels with 77,000 tons in April 1938.

Among smaller companies, the Daido Kaiun Kaisha (United Ocean Transport Co.) had 8 vessels with 77,956 tons.

Open Ports The open ports in Japan proper are Yokohama, Kobé, Niigata, Ebisu, Osaka, Nagasaki, Hakodaté, Shimizu, Takétoyo, Nagoya, Yokkaichi, Uno, Onomichi-Itozaki, Tokuyama, Imabari, Shimonoseki, Hagi, Moji, Wakamatsu, Hakata, Karatsu, Suminoé, Kutchinotsu, Miiké, Misumi, Kagoshima, Izuhara, Naha, Hamada, Sakai, Miyazu, Tsuruga, Nano, Fushiki, Funakawa, Aomori, Otaru, Nemuro, Kushiro, Muroran, Sasuna, Shishimi, Miiké, Shiogama and Kamaishi.

Marine Transportation in 1938-39

The shipping industry in this country witnessed remarkable developments during 1937. The shipping companies imposed upon themselves a voluntary control to curb the soaring shipping rates in connection with what was considered to be the greatest shipping boom since the time of the Great War and later an emergency shipping control law was passed bringing the shipping industry under Government control on account of the outbreak of the China incident. The increased demand for bottoms brought about directly by the incident aggravated the already-felt shortage of shipping space, thus serving to stimulate the rising tendency of freight rates and charterage. As an emergency measure to deal with the situation, the Ministry of Communications adopted a policy of licensing vessels registered in the Kwantung Leased Territory and foreign vessels in general to participate in the coastwise trade of Japan proper. Simultaneously, the Autonomous Shipping Federation fixed standard freight rates and charterage. These measures eased the tense situation facing the shipping trade. In order to provide against any prolongation of the extraordinary situation, the Ministry of Communications then decided to effect a fundamental remedy through the enactment of a temporary shipping control law. A bill for the law was approved at the 72nd session of the Imperial Diet and thus the shipping concerns were brought under wartime control in common with other industrial concerns in the country.

Autonomous Shipping Federation While the shipping concerns were experiencing an unusual boom, the merchants and industrialists interested in the importation of coal, ore, scrap iron and industrial salt in large quantities chafed under the prospects of higher freight rates and difficulty of securing shipping space. The outcry for the enforcement of adequate measures to cope with the situation became louder and louder with the result that Admiral Takuo Godo, former Minister of Commerce and Industry, advocated an alleviation of the restrictions on the purchase of foreign ships as a means of supplying the shortage of bottoms. The suggestion of Admiral Godo failed to be realized on account of an opposition voiced by the shipping circles.

There were indications, however, that if the situation should be allowed to take its own course, the Government might be expected to enforce some measures of control over the shipping concerns on the ground that the rapid rise in freight rates and the shortage of bottoms were accountable for the higher prices of commodities or for the difficulty attending the importation of important raw materials to feed the key industries of the country. Under the circumstances, Mr. Murata, president of the Osaka Shosen Kaisha, proposed the formation of a federation of shipping interests to control the rising tendency of the rates voluntarily. His proposal was supported by all the leading shipping interests and on July 1, representatives of the Nippon Yusen Kaisha, the Osaka Shosen Kaisha, the Kawasaki Kisen Kaisha, the Daido Kaiun Kaisha, the Yamashita Kisen Kaisha, the Kokusai Kisen Kaisha and the shipping department of the Mitsui Bussan Kaisha met together at the office of the Nippon Kaiun Shukaisho in Kobe and their discussions resulted in a decision to organize an Autonomous Shipping Federation with Mr. Murata, the promoter of the scheme, as its chief director.

Digitized by Google

Following the meeting, the seven shipping firms concerned issued a joint statement which read: "We organize an autonomous federation of shipping companies with a view to promoting the sound development of the maritime transportation business of our country in conformity with the prevailing conditions of our Empire and at the same time increasing the efficiency of our shipping service. The present federation will exert its utmost efforts to smooth the transportation of those materials which are essential to our nation in times of emergency." Simultaneously, the following articles of association were announced:

Article 1: All the companies concerned shall co-operate with one another in a spirit of conciliation with a view to promoting the sound development of the maritime transport business of our country and facilitating the proper operation of shipping in conformity with the requirements of the prevailing extraordinary situation.

Article 2: In order to attain the aim of the present agreement, an autonomous federation of shipping companies shall be organized.

Article 3: The method of operating the present agreement and other details shall be determined by negotiations.

Article 4: The term of the present agreement shall be 3 years beginning from the day of its signing.

Article 5: The term as mentioned in the foregoing article may be extended by the unanimous wish of the members.

Emergency Shipping Control Law

The bill for the enactment of an emergency shipping control law as a link in the series of economic legislations aiming at the perfection of the wartime economic system in connection with China incident was presented to the 72nd session of the Imperial Diet and approved by both houses on September 8, and was promulgated on the following day. The principal purpose of the law is, as mentioned in its first article, to adjust the maritime traffic and transport in conformity with the requirements of the China incident.

The new legislation empowers the Government to control the movements of vessels and makes Government permission necessary for the chartering of vessels and acquisition of foreign vessels, and contains provisions for control of shipping lines, freight rates, shipbuilding and seamen. In other words, the legislation paved the way for the Government to have absolute control over the shipping industry.

Nevertheless, up to the time of writing the actual control of shipping had been left with satisfactory results to the shipping concerns themselves who are governed by the Autonomous Shipping Federation and the need for the enforcement of the new legislation was not felt till then. The Emergency Shipping Control Law was enacted rather as a reserve measure to be used only in case of necessity, the shipping companies being expected to exercise voluntary control for the most part. This point was clearly brought out in the interpellations and answers at the Diet session. Mr. Ryutaro Nagai, the Minister of Communications also stated in his speech before the general meeting of shipping business men on August 28 that the Emergency Shipping Control Law was not intended to replace the voluntary control imposed upon themselves by shipping companies, but was intended as a complementary measure to facilitate the shipping circles to conform to the actual needs of the prevailing situation.

The following are the major provisions of the Emergency Shipping Control Law which came into force on October 1, 1937:

Article 1: The present law aims at bringing about an effective co-ordination between the maritime traffic and transport facilities in general in connection with the China incident.

Article 2: The persons to whom the present law shall apply are the subjects of the Empire or the juridical persons of the Empire engaged in enterprises of transporting persons or commodities on the sea.

Article 3: When Japanese vessels are about to be transferred by sale, rented (the term "rent" as used herein also implies chartering for a specified period) or offered as security to persons who are not entitled to possess Japanese ships (the expression "Japanese ships" as used herein also implies Japanese shipping as based on orders issued in the Kwantung Leased Territory), the permission of the Government shall be obtained except in cases which are specified by decree.

Article 4: When persons who may possess Japanese ships are about to acquire ships which are not Japanese ships, they shall obtain the permission of the Government. However, an exception shall be made in regard to ships which are specified by decree.

Article 5: The Government may prohibit or restrict the transportation service of Japanese vessels between foreign ports.

Digitized by Google

Article 6: The Government may specify the routes over which Japanese vessels may ply and what they may transport and order the shipping companies to operate accordingly.

Article 7: The Government may issue necessary orders to persons engaged in marine transportation business, persons possessing vessels or persons manufacturing ships in regard to the freight rates, charter rates, manufacture of ships or prices of ships.

Article 8: The Government may issue orders to shipbuilding concerns regarding the type of ships to be built, materials to be used, fittings to be contained and other matters concerning the manufacture of ships.

Article 9: The Government may issue necessary orders to shipping companies, or persons possessing ships in regard to the shipping, facilities to be provided, the protection of seamen or the perfection of facilities.

Article 10: The Government may order persons engaged in marine transportation business, persons possessing ships or persons manufacturing ships to report on the conditions of their business.

Article 11: The Government may, by decree, make separate stipulations in regard to the qualifications of ships to be put into the service of subsidized routes in accordance with the provisions of the Foreign Routes Subsidy Law.

Article 12: The Government may, by decree, make separate stipulations in regard to how many members of the crew each boat should carry and their qualifications in accordance with the provisions of seamen's law.

Article 13: Before issuing orders in accordance with the provisions of Article 7, the matter shall be referred to the shipping control committee.

The regulations concerning the shipping control committee shall be determined by Imperial ordinance.

Article 14 to 22 omitted.

Article 23: In the case of Chosen and Taiwan, separate stipulations shall be made by Imperial ordinance in regard to the provisions of Articles 11 to 13.

Supplementary Rule: The date of the enforcement of the present law shall be determined by Imperial ordinance. The present law shall be abolished within one year of the termination of the China incident.

The shipping control committee as provided in the Emergency Shipping Control Law was constituted with 33 members headed by Mr. Ryutaro Nagai, Minister of Communications, as the chairman, and the birth of the organization was promulgated on September 30.

Upon the enforcement of the above law on October 1, the authorities of the Ministry of Communications issued a statement in regard to the method of operating the law, which in substance read as follows:

Efforts will be made to promote the smooth transportation of important commodities necessary to the nation by placing the maritime traffic and transport facilities under the wartime system.

A. The transfer, etc. of ships is to be restricted.

B. The shipbuilding in Japan proper is to be promoted.

C. Foreign ships less than 17 years old (16 years old according to later modification) are to be permitted to be imported unconditionally while the importation of foreign ships exceeding the said age is to be permitted under condition that the ships shall be scrapped within specified periods.

D. Navigation of Japanese vessels between foreign ports may be put under restrictions or banned altogether when such measures are considered necessary.

Freight and charter rates are to be maintained at an equitable level as a means of checking the rising tendency of the prices of commodities.

A. The upward trend of freight and charter rates is to be restrained.

B. At the same time, adequate measures of control are to be taken in regard to the prices of newly-built ships and the prices of slightly used ships.

Endeavours are to be made to maintain the rights of Japanese to navigate along foreign routes and prevent the trespassing by foreign vessels.

A. Ships are to be put into service on various routes in conformity with their actual conditions and the present positions are to be maintained as much as possible although expansion may be impossible under the prevailing conditions.

Prudence will be used in regard to the actual operation of the Emergency Shipping Control Law.

A. Technical matters are to be studied by a committee of experts composed of 15 members to be created within the shipping control committee.

B. Co-operation of shipping interests, shipbuilding organizations, consignors, traders, marine insurance concerns and bankers is to be obtained in dealing with the current situation.

N.Y.K. Shipbuilding Plan In April, 1938, the Nippon Yusen Kaisha publish-

Digitized by Google

ed a gigantic shipbuilding plan, according to which 21 new ships with an aggregate tonnage of 221,600 tons will be added to its great fleet in a year or so. Two passenger ships of 26,500 ton size will be constructed for the Yokohama-Sanfrancisco line, three passenger ships of 16,500 ton size for the Japan-Europe route, two passenger ships of 11,400 ton size for the Yokohama-Seattle line, two passenger ships of 11,600 ton size for the Japan-Australia line, seven cargo boats of the Akagi Maru type with a tonnage of 7,100 tons each, one passenger ship of 7,400 tons for the Japan-China line, and four cargo boats of 7,000 tons each for the Yokohama-Shanghai line. Five bigger ones are already under construction to be completed in 1939.

Agreement with Australia The Japan-Australian negotiation on sea transportation which was commenced on January 6, 1938, came to a conclusion on July 2, between the representatives of the E. A. Company and the Japanese shipowners. According to the new agreement the pool point to be given to the E.A. Company of Australia was fixed at 22.5 per cent for both ways, effective for two years beginning with July 1, the difference between the new and old agreements is that the pool point to be given to the E. A. is increased by 2.5 per cent in shipping wool and decreased by 2.5 per cent in taking Japanese miscellaneous goods on the return voyage. The term of agreement was lengthened to two years for miscellaneous goods transportation which had been fixed as one year in the previous agreement.

Predominance of the Japanese Sea Transportation in the Orient The Japanese sea transportation world is facing several difficulties in coping with the epochmaking changes in the business in the area affected by the Sino-Japanese hostilities, and yet striving for the future prosperity.

As to the ship-bottoms, the call of ships to the near seas has become urgent with the advance of months, and the tonnage of ships placed for near seas transportation increased from 2 million tons to 3.5 million tons as a result of the transfer of half a million tons from the ocean lines and the placement of newly constructed ships which aggregated to over 900,000 tons. If the bottoms of the ocean liners passing through near seas be added the total tonnage is estimated at over 4 million tons. According to the investigation made by the Japan Shipowners Club, the aggregate tonnage of ships owned by the shipowners other than the N.Y.K. and O.S.K. increased from 2,117,000 tons in June, 1937, to 3,519,000 tons in July, 1938, for near seas, while it decreased from 1,374,000 tons to 909,000 tons for ocean transportation.

Even with such an increase of tonnage the sea transportation for near seas was troubled with a shortage of bottoms and unable to meet the demand and the freight rate naturally soared. Whereupon the Autonomous Shipping Federation was organized and the federation made endeavours to check the rise in freight rates by fixing standard rates for both freight rates and charter rates on their own accord beginning with August, 1937, and revising them several times since. The fourth standard rates were 10 per cent reduction as compared with the third standard rates and the comparison between the rates in May, 1937, and those of the fourth standard rates fixed in August, 1938, was as follows:

Freight Rates

(In yen)

	May, 1937	August, 1938
Coal (Wakamatsu-Yokohama)	4.13	4.60
Coal (Muroran-Yokohama)	3.70	4.40
Karafuto timber	400.00	350.00
South Seas Iron Ore	7.70	9.50
American timber (dollars)	18.00	12.00

Charter Rates

Grade of Ship in ton	May, 1937	August, 1938
1,000	7.60	14.00
2,000	7.85	12.00
3,000	7.00	8.00
4,000	7.15	7.40
5,000	7.40	6.75
6,000	7.40	3.85
7,000	7.10	3.85
8,000	7.14	5.40
9,000	6.90	5.40

Establishment of the To-A Kaiun Kaisha For the predominance of the Japanese sea transportation in the Orient the shipowners held a general meeting in Tokyo on August 5, 1939, to establish a new corporation for carrying on sea transportation in a greater scope along the Oriental coasts by their united efforts. The new corporation is called the To-A Kaiun Kaisha, or East Asia Sea Transportation Company, capitalized

Digitized by Google

at ¥73,000,000. The purpose of the company is to carry on sea transportation business between Japan and China, along the coasts of China, and between China and other countries; warehouse business in China and other places and other enterprises related to sea transportation. Proposed lines are Japanese ports—Tientsin, Japanese ports—Tingtao, Japanese ports—Shanghai, Japanese ports—South China ports, Formosan ports—Shanghai, Formosan ports—Tientsin, Formosan ports—South China ports, Dairen—North China ports, Tientsin—Shanghai, Tientsin—South China ports and Dairen—South China ports.

A Common Fund An extraordinary general meeting of the Japan Shipowner's Association was held in Kobe on September 28, 1938, for raising a common fund for the promotion and protection of sea transportation business. There were 64 shipowners present at the meeting presided by S. Murata of the O.S.K., and passed a decision on saving up a common fund by the cooperation of the members to promote common interests at the time of business boom and to minimize possible losses at the time of depression.

The fund amounted to approximately ¥3,000,000 in March, 1939, and it is expected to reach ¥10,000,000 by the end of the year on account of the increase of member shipowners by the reorganization of the present Japan Shipowners' Association to the Sea Transportation Association according to the provisions of the new Sea Transportation Association Law.

Subsidies for the Construction of Ships The Department of Communications filed a bill concerning the promotion of the construction of mean and small sized ships for near-sea transportation, and was approved by the Imperial Diet in the spring of 1939. The new law provides for allowing subsidies to shippowers to an aggregate sum of ¥5,200,000 in 1939-40 and ¥800,000 in 1940-41. The average rate of the subsidy shall be ¥30.00 per ton for the construction of ships with an aggregate tonnage of 200,000 tons during the coming two years.

The tonnage of mean and small sized ships owned by the shipowners in Japan which was 33.8 per cent to the total tonnage in 1932 decreased to 32.7 per cent in 1937, and the recent activities of near-sea transportation demand a greater number of these ships and the new law aims at the promotion of the construction of ships less than 5,000 tons each by the allowance of subsidies, fixing the categories of ships to three classes which are 4,300 ton ship with a maximum speed of 14 knots, 2,600 ton ship, speed 13 knots and 1,900 ton ship, speed 12 knots.

Laid-up Ship According to the investigation made by the Japan Shipowners' Association the total tonnage of the laid-up ships in the world on December 10, 1938, reached 3,217,000 tons, increasing by 29,000 tons as compared with the previous month. Details by countries follow:

	November 10, 1938	December 10, 1938
	(Unit: 1,000 tons)	
Great Britain	443	637
U. S. A.	1,348	1,348
Japan	14	14
Norway	335	168
Italy	138	168
France	181	176
Sweden	86	69
Greece	459	459
Others	184	178
Total	3,188	3,217

Standard Types of Ships The Ships Improvement Association held a general meeting on February 15, 1939, and passed a decision on the standard types of ships to be constructed in coming years according to the recommendations of the Specialist Committee which had been entrusted with a thorough study on the question for the past three years. The standard types are fixed for the rationalization of shipbuilding and the economy of sea transportation business. Details of the standard types follow:

	For Ocean Transportation			For Near-sea Transportation			
	A Type (Turbine)	A Type (Diesel)	B Type (Turbine)	C Type (Recipro.)	D Type (Recipro.)	E Type (Diesel)	F Type (Diesel)
Weight tonnage	9,300	9,240	6,840	4,250	3,000	1,250	750
Gross tonnage	6,300	6,200	4,470	2,750	1,990	850	490
Length (metre)	135.5	135.5	118.6	98.0	89.9	64.5	52.9

Regulations for the Promotion of the Sea Transportation of Japan The Imperial Diet which was held early in 1939 passed three important bills for the promotion of the sea transportation business of Japan. They are the Sea Transportation Association Law, the Shipbuilding Law and the Shipbuilding Financing Law. The first law aims at the inclusion of all the shipowners in Japan in one national association in order to unify the working of ship companies by the hand of the Department of Communications, while the control of the business was formerly left to the autonomous judgments of the Japan Shipowners' Association. The second and third laws aim at the control of shipbuilding in the country so as to lower the prices of ships to the international level and to help a greater production of ships for the realization of a predominant fleet of commercial vessels on the Pacific in the near future.

Business Conditions of Shipping and Shipbuilding Companies The business conditions of principal shipowners and dockyards in 1937 and 1938 were as follows:

BUSINESS CONDITIONS OF PRINCIPAL SHIPOWERS AND DOCKYARDS IN 1937 AND 1938

(Unit: ¥1,000)

			Paid-up Capital	Reverves	Net Profit	Rate of Profit	Rate of Dividend
Nippon Yusen Kaisha	1937	A	64,250	61,622	8,456	39.0	6.0

CHAPTER XXVII

JUSTICE AND POLICE

Judicature

The Judicature's Position

Since the promulgation of the Japanese Constitution in 1889, the right of the sovereignty of the Emperor has been divided into the three distinct departments, of legislation, judicature and administration.

In accordance with Article 57 of the Constitution, "the Judicature shall be exercised by the Courts of Law according to law, in the name of the Emperor." Judges are appointed from among those possessing such qualifications as are determined by law and they are guaranteed by the Constitution against being deprived of their positions unless by way of criminal sentence or disciplinary punishment. Not only are the judges guaranteed their positions, but they have authority in exercising judicial power to judge on their own independent views, using the statutes as the sole standard of judgment without being in any way swayed by interference from others and unaffected by authority arising from any quarter.

Since the judges are entirely independent of the administration the results of judicial decisions are equally independent thereof, and the decisions are not affected by the administrative power except in cases of pardon or provisional release.

Composition of the Courts

In Japan, the ordinary Courts of Law for the adjudication of civil and criminal cases consist of (1) Local Courts (Ku-Saibansho), (2) District Courts (Chiho-Saibansho), (3) Courts of Appeal (Koso-in), and (4) the Supreme Court (Tai-shin-in). The Local Courts, the Courts of Appeal and the Supreme Court are all collegiate courts with special divisions, in each of which sit a number of judges.

Local Courts The Local Courts are presided over by single judges. A three instance system is adopted in the adjudication of all ordinary cases, and any one may lodge an appeal against a judgment rendered in the first instance and demand revision of that rendered in the second instance.

In the matter of civil cases, the Local Courts possess judicial power to adjudicate on the following matters in the first instance :

1. Demands for money less than 1,000 yen or for articles, the value of which is less than 1,000 yen.

2. The following cases irrespective of value :

(a) Legal actions brought by lessors against lessees, or vice versa, for the receipt, vacation, use, occupation or repair of houses or other buildings or parts thereof, or for the seizure of the furniture and fixtures or belongings of lessees by lessors.

(b) Legal actions only concerning the boundaries of real estates.

(c) Legal actions only concerning occupations.

(d) Legal actions brought by employers against employees, or vice versa, for contracts of employment, the terms of which do not exceed one year.

(e) Legal actions brought by travellers against hotel or inn keepers, or vice versa, for matters concerning board or lodging, or by travellers against water or land forwarding agents, or vice versa.

(f) Matters concerning bankruptcy.

In criminal cases, the Local Courts, as the courts of law for adjudication in the first instance, possess judicial power concerning the following matters, provided they have not been subjected to preliminary examination :

1. Offences punishable with detention or fine.

2. Offences punishable with penal servitude, imprisonment for fixed terms or by imposition of fines, except those punishable with penal servitude or imprisonment for more than one year.

District Courts In civil cases, the District Courts possess judicial power concerning the following matters:

1. In the first instance :

Demands other than those falling under the jurisdiction of the Local Courts or of the Courts of Appeal.

2. In the second instance :

(a) Appeals lodged against judgments rendered by the Local Courts;

(b) Demands determined by law for revision of decisions or orders render-

Digitized by Google

ed by the Local Courts.

Further, with reference to criminal cases, the District Courts possess judicial power concerning the following matters:

1. In the first instance:

Criminal cases falling neither under the jurisdiction of the Local Courts nor under the special jurisdiction of the Supreme Court.

2. In the second instance:

(a) Appeals lodged against judgments rendered by the Local Courts;

(b) Complaints determined by law against decisions or orders rendered by the Local Courts, except those falling under the jurisdiction of the Supreme Court.

Courts of Appeal The Courts of Appeal possess judicial power concerning the following matters:

1. Appeals lodged against judgments rendered in the first instance by the District Courts.

2. Complaints determined by law against decisions or orders rendered in the first instance by the District Courts, except those falling under the jurisdiction of the Supreme Court.

Powers to adjudicate in the first and second instances in civil cases brought against the members of the Imperial Family belong to the Tokyo Court of Appeal.

The Supreme Court The Supreme Court (Taishin-in) is the highest court of law and possesses judicial power concerning the following matters:

1. In the final instance:

(a) Appeals against judgments rendered by the lower courts;

(b) Complaints determined by law against decisions or orders rendered in the second instance by the District Courts or by the Courts of Appeal;

(c) Complaints against decisions to reject appeals made by the Local or District Courts.

2. In the first, and at the same time, final instance: Preliminary examination and adjudication of offences against the Imperial House, offences of internal disturbance, and offences committed by members of the Imperial Family, for which punishment heavier than imprisonment should be imposed.

Public Procurators

A public procurator's office, with the necessary number of procurators, is attached to each court. The work of the public procurator is, in accordance with the code of criminal precedure, to take legal actions, to go on with necessary legal proceedings, to demand a right application of the law, and to observe the right execution of a judgment. According to the code of civil procedure, he also has rights to ask for a report whenever he thinks it necessary and present his opinions to the court on it, and as a representative of public welfare he carries out his supervising business as laid down by the law in all judicial and administrative matters related to the court. But the public procurator acts absolutely independently of the court.

Court Officials and Procurators

Qualifications Candidates for the office of judge or procurator are chosen by the Minister of Justice from among those who have passed the higher judicial service examination. The selected candidates then have to serve a term of over one and a half years of probation in the courts or in a public procurator's office and pass a further examination, after which, should the report on their estimated ability be favourable, they will receive an appointment as judge or procurator. But those who have been professors of law in the Imperial Universities or lawyers of over three years standing can be appointed as judges or public procurators without examination and estimation.

The following are not to be appointed as either judges or public procurators.

(1) Those who have been convicted of a grave crime, with the exception of those political offenders who have been rehabilitated.

(2) Those who have served sentences on minor offences.

(3) Those who have been adjudicated bankrupt and could not be exempted from the responsibility.

Position of Judges and Public Procurators Judges are permanent officials appointed by His Majesty directly, or by His Majesty's order indirectly, or by His Majesty's approval, according to the grade of their position. Unless by way of criminal sentence or disciplinary punishment judges are not to be moved to another post or place, be suspended from office, be deprived of position, or receive a reduction of salary, without their consent, except in so far as the Minister of Justice may order retirement from service by the decision of a general meeting of the Court of Appeal or the Supreme Court on account of disability caused through weakness of body or mind.

The retiring age is for the President of the Supreme Court 65 years, and for other judges 63 years.

The public procurators are appointed by His Majesty directly or by His

Digitized by Google

Majesty's order indirectly or by His Majesty's approval. Unless by way of criminal sentence or disciplinary punishment the public procurators are not to be deprived of their positions against their own will.

The Procurator-General at the age of 65 years and all other public procurators at 63 years of age must retire from service. A public procurator must obey the orders of higher authorities and judicial policemen must obey the orders issued by the public procurators or through them within the district of jurisdiction of the public procurator's office.

The Jury System

In 1923 the Jury Law was issued, and Japan finally adopted the jury system under which persons other than judges are allowed to take part in criminal trials. The jury system is used in such criminal cases as where the punishment may be capital, or penal servitude or imprisonment for life. Other criminal cases in which the sentence may be penal servitude or imprisonment for a term longer than 3 years are tried by jury only upon demand of the accused and when they come within the jurisdiction of the District Courts. The following cases are not submitted to trial by jury:

(1) Offences which come under the special authority of the Supreme Court.

(2) Offences against the Imperial House, causing an internal disturbance, helping an enemy, disturbing international relations, and sedition.

(3) Violations of the Peace Maintenance Law.

(4) Violations of the Military Secrets Preservation Law, the Army or Navy Criminal Laws or any other offences in connection with military secrets.

(5) Violations of the Public Election Laws.

The accused can refuse to have his case tried by jury or withdraw his own demand to be tried by jury at any time previous to the statement of the case by the public procurator, under which circumstances the case cannot be referred to a jury.

The jury is composed of 12 men. At the trial, the chief judge, after having heard all the evidence for and against the accused, sums up the facts and main points of the case, and charges the jury to deliberate and render its verdict by a majority vote. The verdict must be a simple statement as to guilt or otherwise. If the court considers the verdict improper the case may be referred to another jury.

In a case where sentence has been passed on a jury's verdict of guilt, no appeal can be made to the Court of Appeal, but a demand for revision may be presented to the Supreme Court.

Penal System

History It was in the time of the Empress Suiko, 620 A.D., that the first written Penal Code was issued in Japan. The code was very simple, but later the Chinese penal code, the "To", was introduced and the Japanese code was drafted in a more systematic manner and promulgated by the Emperor Mommu, in 702, as the "Taiho Ritsu-Ryo." Five kinds of punishment were mentioned, namely, flogging, whipping, penal servitude, exile, and death, but in most cases these could be varied to confiscation of property or payment of a fine. Grave crimes were treason, atrocities, blasphemy, undutifulness to one's parents, adultery, etc. Confession of the accused was required as a necessary procedure of a criminal suit, and naturally torture was recognized as an indispensable means of obtaining such a confession. Several hundred years after the issuance of the Taiho Ritsu-Ryo the Shogunate Governments adopted extremely terroristic penal systems with the purpose of preventing the occurrence of criminal cases. One of the most important of them was the One Hundred Criminal Regulations of the Tokugawa Shogunate. It was a secret criminal code which was not published and was accessible to the judges only, an expression of the despotism of the ruling class that had as its motto, "leave the people ignorant of the niceties of law."

With the downfall of the Tokugawa Shogunate the Great Emperor Meiji abolished the system of intimidation and reformed the old penal code. The codification of Civil Law was carried on under the advice of Monsieur Gustave Boissonade, a French scholar of jurisprudence who was invited to Japan for that purpose. A new Penal Code and Criminal Procedure Law, the characteristics of which were that, "though the lawful punishment of criminals is assured, the penalties are tempered with sympathy toward the accused and are in no ways severe," were enacted and promulgated. "No crime shall be punished unless there is a regulation in the law," (nullum crimen et nulla poena sine lege). is one of the guiding principles of the code, which was formulated on the French penal code of 1810. Within a few years it was found that the new code was out of date and various amendments were discussed from 1884 to 1907, in

Digitized by Google

which year a thorough revision was made and the present Penal Code issued. Since then the social conditions of the people have undergone rapid changes, more advanced theories regarding penalties have been gaining ground and so many defects have been noticed in the present code, that in 1926 the Extraordinary Legislative Committee passed a resolution that the Penal Code should be revised. A special investigation committee set to work and in 1931 an outline and draft of a revised penal code and prison law was drawn up. It is expected that the thorough study of the draft that is now going on will soon be completed.

Penalties Penalties are divided into six kinds, namely, the death penalty, penal servitude, imprisonment, monetary penalties, custody, and fines. Confiscation is recognized as an additional punishment. The death penalty is by hanging and is carried out in prison. Penal servitude and imprisonment are for limited terms and for life; limited terms extend from one month to 15 years. Under penal servitude labour is compulsory, but a prisoner serving a term of imprisonment is not compelled to work, though he may be allowed to do so at his own request. A monetary penalty is 20 yen and above, unless made lighter on decision. Custody is from one to under 30 days, and a fine is from 10 sen to less than 20 yen. Those who cannot pay monetary penalties and fines are kept in workouses as an alternative.

Suspension of Sentence and Provisional Release The present penal law allows probation. The execution of a penalty often leads to self-abandonment and turns comparatively harmless people, who are not yet addicted to criminal deeds, into habitual jail-birds. This is found to be especially so when the penalty is one of penal servitude for a short time, and it is, therefore, far better for people convicted of light and incidental offences to be excused from the real infliction of the penalty under special conditions and to be given proper admonitions in order to make them repentant by self-examination. Consequently, the Japanese courts are empowered, under certain conditions, to postpone the execution of sentence for from one to five years, beginning with the day of the sentence and according to the nature and condition of the case, on persons sentenced to penal servitude or imprisonment for less than 2 years.

Probation is cancelled (1) when the probationer, during the time of probation, commits another offence and is sentenced to imprisonment or is given a heavier sentence, (2) when the probationer is sentenced to imprisonment or a heavier penalty is imposed because of some other crime committed before the granting of probation, and (3) when, in cases not mentioned above, the probationer is found to have had at some previous time a sentence of imprisonment or some other heavier penalty inflicted on him. Should the term of probation expire without being revoked the sentence is automatically cancelled thereby. The draft of the penal code of 1931, besides confirming the system of probation, admits the principle of postponement of passing sentence in specially pitiable cases of a non-serious nature.

Release on parole was practised as early as 1790 in the House of Correction at Ishikawajima, Yédo; the present law admits it and it is widely practised. As reformation is one of the chief aims of punishment, when convicts are evidently repentant and there is no fear of their committing further crimes, it is unnecessary to continue the punishment. Therefore, it is stated in the present Penal Code, "when the convicts who are under penal servitude or imprisonment are found to be evidently repentant, provisional release may be authorized by the administrative office after they have finished one-third of the limited term or ten years of the term for life" (Article 28).

Provisional release may be cancelled (1) when the persons on parole have committed another offence during the term of the release and have been sentenced to a monetary or heavier penalty, or (2) when they are sentenced to a monetary or heavier penalty because of some other offence committed before the provisional release, or (3) when they were sentenced to a monetary or heavier penalty because of another offence committed before the provisional release and that penalty must now be fulfilled, or (4) when they break the provisional release rules. In this case the rest of the term of sentence must be served.

The China Affair and the Released Those who are released on probation on the strength of this system continue to increase in number year after year. In 1936, those released totalled more than 5,300. When the North China Incident broke out in 1937, many convicts received orders for military service, and steps were taken speedily to release on probation many of them who were found fit both mentally and physically for service in the army in order to give them the opportuniy of doing their duty as soldiers of the Empire.

Digitized by Google

Feeling sincerely grateful to the Throne for the privilege thus extended, these soldiers departed valiantly for the front much to the admiration of those who were acquainted with the circumstances. This episode may be remembered as an instance of no small import in connection with penal administration.

Juvenile Criminals Article 27 of the Code of Criminal Procedure says, "public suit may not be instituted when the suit is found unnecessary because of the character of the criminal, his age and environment, the condition of his crime and his behaviour after the incident," and leaves the decision as to whether proceedings should be taken to the public prourator. The existing criminal system of Japan is thus inclined to some extent to subjectivism, putting emphasis on the offender himself rather than on the offence. Its evident expression is found in dealing with young offenders. According to the provisions of the Juvenile Criminal Law, 1922, young boys or girls who are under 18 years of age are called juveniles and their offences are dealt with, not under the penalty system, but by a system of protection. Even when they are punished, the penalty is inflicted in a special way. Protective measures are (1) to give admonitions, (2) to leave them to the guidance of school principals, (3) to let them solemnly declare their sincere repentance in a written statement, (4) to place them, under certain conditions, in the care of their parents, (5) to place them under the care of temples, churches, protective bodies or other proper persons, (6) to hand them over to the care of the juvenile probation officers, (7) to send them to reformatories, (8) to send them to houses of correction, and (9) to put them under proper treatment in hospitals. These measures may be continued till the juveniles reach the age of 23 years. When juveniles are admitted to probation or provisional release they are not put under police supervision as is the case with the adults, but are left to the care of the juvenile probation officers. For the protective disposition of juvenile offenders juvenile courts have been established.

Special Measures for Juveniles Special measures for the penal punishment of juvenile offenders are :

(1) The death penalty or penal servitude for life is not inflicted upon a person who is under 16 when the crime is committed. When the crime is so grave that the death penalty or penal servitude for life should be passed, the sentence is mitigated to penal servitude or imprisonment for 10-15 years.

(2) When a juvenile criminal should be sentenced to penal servitude or imprisonment for more than three years at its maximum, the minimum and the maximum limits are fixed within the scope of the penalty to be inflicted on the crime committed. And when he should be sentenced to imprisonment for more than 5 years at its minimum, the term is diminished to 5 years. That is to say, in case of a juvenile convict an indeterminate sentence is admitted.

(3) Juveniles sentenced to penal servitude or imprisonment are put in a special jail or in a section of the common prison secluded from adults. If they reach the age of 18 during the term of confinement they may still be kept secluded till they reach the age of 23.

(4) Juveniles sentenced to penal servitude or imprisonment can obtain provisional release (a) after 7 years in case of a life-term sentence, (b) after 3 years in case of (1) above mentioned, (c) after serving one-third of the time in case of (2) above.

(5) Juveniles are not sent to work houses.

The China Affair and Juvenile Offenders The work of the juvenile courts, with the collaboration of the allied institutions, has since made remarkable progress and each year over ten thousand children come under its attention, the majority of whom after the regimen of discipline come forth regenerated as dutiful and willing members of society. The importance of juvenile protection has never been appreciated more keenly than at this time of long-term construction. In some instances, the delinquents themselves are practising strict thrift in order to be able to use the savings for the consolation of soldiers at the front or in the hospitals. In other instances, they are rendering service by working for the homes of soldiers at the front, making the premises of shrines clean, or joining in public services. Furthermore during 1938, as many as 162 of the regenerated youths entered the military service. There will be many more of them this year. One of these has become an aviator and already holds a brilliant record as a pilot; another has been a recipient of commendation for valour and exemplary conduct. Some of those who have failed to become soldiers have gone to the continent to till the soil; in fact last year 176 persons expressed the same desire and 53 of them are already at their work in the land of promise. Many others have

Digitized by Google

received mechanical and other technical training and have found employment in industries which are in line with home-front measures.

Second and Habitual Offenders

In case of those who repeat criminal deeds and commit other offences, especially in the case of professional and habitual offenders, it is necessary to put them into confinement for considerable lengths of time in order to give them time to reform their character and at the same time protect society at large from their depravations. To deal with these people Japanese criminal law provides a system of aggravating penalties for the recidivists and admits special dealing with habitual thieves as a complementary system.

Repetitious Offenders (Art. 56–59, Penal Code) When a person commits another crime and is sentenced to limited penal servitude within five years from the day of release from former penal servitude or from remission of execution of a penalty, he is classified as a second offender. Under the name of repetitious offenders come all second offenders and up. The cases of remission of penal execution are extinction of prescription, special pardon and the case stated in the Penal Code, Art. 5. Amnesty and probation not only remit penal execution, but cancel the effect of the penalty altogether, and the crimes concerned cannot be taken as the basis for forming a repetitious offence. Again, when a person commits a crime during a term of probation the offence for which the probation was admitted is not counted as the first offence. The penalty inflicted on a repetitious offender is aggravated.

Habitual Thieves Habitual offenders are most numerous in burglary and larceny cases. The habitual offenders often regard prison as their residence and repeat crimes immediately after their release, to the great harm of the community, in order to get back "home". They have, therefore, to be separated from society by the infliction of comparatively long sentences. In many cases it has been impossible to increase the penalty, or when it has been increased it has still been too short, and as there is no provision in the existing Penal Code for unlimited imprisonment the Thief Prevention Law was enacted in 1930. According to this law, when persons commit burglary or larceny habitually by the use of weapons, or by forming a band of more than two, or stealthily breaking into houses by night, they are punished by being sent to penal servitude for more than 2 years in the case of a thief and more than 7 years in that of a burglar. The draft of the revised penal law of 1931 adopts the system of incarceration for unlimited terms for habitual offenders (Draft, Article 91–95).

Peace Preservation

Penalties are imposed as deterrents, but are not always effective, especially in the case of insane people and habitual drunkards, as well as in that of habitual offenders. For that reason it is advisable that, in addition to meting out punishment for any wrong-doings, it should be possible to segregate such people from law-abiding society. To meet this need, most of the countries of the world have a supplementary system of Peace Preservation Laws, which restrict to a certain extent the freedom of released persons as long as their dangerous character is unimproved. In Japan the existing Penal Code makes no provision for such a system, but the draft of 1931 suggests four kinds of peace preservation regulations, namely, preventive surveillance, curative treatment, compulsory labour, and preventive detention.

Surveillance When persons who are defective in mind or body or are deaf-and-dumb are to be sentenced to imprisonment or some heavier penalty, the Court can decide to place them under surveillance. In case the sentence has already been passed for one reason or other, surveillance will follow the execution of the sentence, but in some cases it may be carried out before the commencement of execution or at any time during its course, (draft, Art. 127). Those who are put under this measure are to be kept in the surveillance house and receive treatment for their defectiveness, while being under surveillance. They may be released when further surveillance is found unnecessary by order of the administrative offices. In principle the time of surveillance is 5 years, but this may be renewed by the Court when thought necessary. When the sentence and the surveillance disposition are pronounced at the same time, the Court may choose either one of them as one of the two became unnecessary by the enforcement of the other.

Curative Treatment When drunkards or users of narcotics commit offences while in a state of intoxication or insensibility and it is found necessary to correct them of their bad habits, the Court may order them to be kept in Homes of Correction for a period of 2 years and receive proper curative treat-

Digitized by Google

ment.

Compulsory Labour When persons who habitually commit crimes because of vagrancy or hatred of labour are to be sentenced, the Court may order compulsory labour together with the regular sentence for a period of 3 years, during which time they are to be kept in compulsory labour houses and compelled to work diligently under strict discipline in order to acquire the good habit of work. The chief official of the labour house may send them to work for the Government or to public or private factories, to farms or other places of labour, allowing them to stay outside the Compulsory Labour Houses, if deemed expedient.

Preventive Detention When the convicts who are to be released at the expiration of a term of penal servitude are found to be addicting to incendiarism or likely to commit murder or burglary, the Court may order them to undergo preventive detention, (draft, Art, 139). They are to be kept in Houses of Prevention and get the treatment necessary for leading them to full repentance. The duration of the treatment is 2 years in principle, but may be prolonged by the Court. This measure is to take effect after the expiration of the regular term of penal servitude, (Draft, Art. 140–142).

Criminal Thought Offence The Communist movement in this country has, since two or three years ago, been heading for its end and ruin on account of various factors, both internal and external, including the enforcement of a strict policy of the Government for rounding of the Communists and the enhancement of the national spirit brought about by the outbreak of the Manchurian Incident. The conditions, however, still remain such that no optimism can be warranted in regard to the future of the Communist movement.

The number of arrests made on charges of violation of the Peace Preservation Law since 1928 has exceeded 60,000 person. Of these, more than 10,000 persons have been granted a reprieve in their indictment or a stay of execution of this sentence, have served their sentence or have been released on bail. The minds of these men are of divers trends at present; some of them have recanted, others, are of a very ambiguous turn of mind, making it impossible to judge whether they are going to change their minds or not, while still others seem to embrace rebellious ideas.

It goes without saying that those who have not yet changed their minds are liable to repeat their offence or commit similar ones. Even some of those who have already changed their minds may again commit some offence under the influence of their environment or because of social conditions unless some preventive measures are taken, in view of the fact that "thought" offences are attributable largely to social conditions. It is an urgent need, therefore, under the current situation both at home and abroad, that a prudential policy should be established for the termination of the rebellious movement by preventing repetition of similar offences in the future. The necessity is keenly felt for the establishment of adequate facilities to encourage those who have not yet changed their minds or who have changed their minds only partially to effect a complete change and at the same time enable those whose minds have been completely changed to lead a legitimate and orderly life no matter how social conditions may change in the future. It is in this necessity that the reason is found for the adoption of the protection and surveillance system.

Protection and Surveillance System The new rule which involves the creation of protection and surveillance stations and the establishment of a protection and surveillance commission is aimed at protecting persons who have once committed "thought" offences and preventing them from repeating the crime. It not only calls for placing old offenders under surveillance but aims at giving them positive guidance in order that they will not commit similar offences and will walk in the path of rectitude. This positive nature of the new system is expected to help in bringing about the defeat of Communism and elevating the Japanese spirit through encouraging those on the way of changing their minds to forge ahead, and assisting those who have already done so to earn a living. It constitutes an important link in the national "thought" defence line on the strength of its mission towards the preservation of peace and public order by preventing "thought" offences on the one hand and on the other by serving to elevate and clarify the essential spirit of the nation.

Objectives of the New System The objectives of the protection and surveillance system are limited to persons who have committed offences in the light of the Peace Preservation Law. Offenders of other kinds do not come within its scope. Only those who have been granted a reprieve in indictment by the public prosecutor, or a stay of execution of their sentence by the law court, or

Digitized by Google

who have been released on bail, or who have served their term, are placed under protection and surveillance. The invocation of this rule, however, must be made with the approval of the Protection and Surveillance Commission which is under the control of the Minister of Justice, and in such cases where the commission adopts a resolution against the invocation, the rule cannot be invoked.

Organs and Procedure The new system is enforced through the operation of 22 protection and surveillance stations throughout the country and a protection and surveillance commission. These stations are independent offices and are located in Tokyo, Yokohama, Mito, Mayebashi, Shizuoka, Nagano, Niigata, Osaka, Kyoto, Kobe, Takamatsu, Nagoya, Kanazawa, Hiroshima, Okayama, Fukuoka, Kumamoto, Sendai, Akita, Aomori, Sapporo and Hakodate and their staffs are composed of guiding officials, protecting officials and secretaries.

The guiding officials take charge of directing and supervising the protection and surveillance business and as such may be regarded as the central machinery of the protection and surveillance stations. The protecting officials conduct the enquiry and surveillance business under instructions from the station masters, who are selected from among the guiding officials. There are at present 33 whole-time protecting officials over all the country and the Minister of Justice may commission other suitable persons as part-time officials.

The protection and surveillance stations are to be notified by the authorities concerned when some "thought" offenders have been granted a reprieve in indictment, a stay of execution of their sentence, have been released on bail, or have left prison after serving their term. Upon receipt of such a notification, the station concerned must immediately institute an investigation into the career, environment, mental and physical condition, and changes in thought and other relative affairs of the person in question. In the investigation, special attention should be given to ascertaining whether the person in question has changed his mind or not and if so, the motive and extent of the change as well as the character and financial and family conditions of his guardian and whether there is any prospect of the person in question earning a living in the future.

If the results of the investigation lead to a decision to place the person under protection and surveillance, the station concerned is to refer the matter to the protection and surveillance commission which must then pass a judgment. The station cannot place any person under protection and surveillance until it has received a notification from the commission that its decision has been approved.

Methods of Effecting the Protection and Surveillance There are three different methods for effecting the protection and surveillance. One is that the protecting officials concerned keep a personal surveillance over the person in question, another is to hand the person over to his guardian. In the third method, the person is put in the charge of some protective organization, temple, shrine, church, hospital, etc. In all the three cases, the station authorities concerned must explain to the person in question the significance of the decision to place him under protection and surveillance and caution him about his future conduct.

According to circumstances, two or even three methods may be employed simultaneously. The authorities concerned may also put restrictions on the abode, intercourse and correspondence of the protected if such a measure is deemed necessary or advisable.

The period of protection and surveillance is fixed at two years but it may be shortened or prolonged. Prolongation of the period, however, requires the approval of the protection and surveillance commission.

As already stated, the protection and surveillance system has, as its primary aim, the encouragement of "thought" offenders to change their minds and the assistance of those who have changed their minds in securing a living. It therefore is natural that adequate measures should be taken to guide such persons properly in thought and help them to enjoy life.

In view of the specific nature of "thought" offenders, the authorities follow a principle of respecting their social conscience and conception of justice while encouraging them to master the Japanese spirit. As a stable living has a close bearing upon the perpetuation of the change in mind, efforts are also made to secure suitable positions for persons under protection and surveillance and to assist them in making their own homes and appreciating the beautiful points of the Japanese family system. Facilities for attendance at school are also provided in some cases.

The adoption of the above system constitutes an epoch-making event in the history of criminal administration in this country in that it has extended the scope

Digitized by Google

of state protection and assistance from juvenile offenders to some adults. It has long been a loud cry that the enterprises for aiding ex-convicts and persons under specified circumstances should not be left to the hands of charitably disposed civilian organizations and individuals alone but that the State should share the responsibility with society. The enforcement of the new rule forms an official action which recognizes the legitimacy of the contention.

It is considered a natural conclusion that this system will eventually lead to legislation recognizing that general activities in protecting and aiding discharged prisoners should be in the nature of State enterprise.

There has been another claim in this connection, that the management of this kind of public enterprise should be rationalized and expanded in scope, and that closer relations should be established between the enterprises and the law courts, public procurators, prisons, police and employment offices as well as local communities. This demand, it is to be noted, has also been partially met by the inauguration of the protection and surveillance system for "thought" offenders.

Thus, the new system is expected to help in promoting the progress of the enterprises for protecting and aiding discharged prisoners and in facilitating the fulfilment of the mission of such enterprises in preventing crime.

Criminal Compensation System

A nation has the responsibility of compensating innocent persons who have been wrongfully punished or have been kept in detention during trial. The Criminal Compensation Law was enacted in 1931. Cases to be compensated according to the Law are as follows:

(1) When a verdict of "not guilty" or an acquittal has been given by the examining judge to a person who has been kept in detention, the State makes compensation for the loss caused by the detention.

(2) In case a verdict of "guilty" is reversed by a higher court and the accused has already suffered the execution of the penalty or was kept in detention before the execution, the State makes compensation for the loss caused by the penalty or detention.

When the accused is dead, the bereaved get the compensation. The bereaved in the terms of the Law are meant to be the spouse, children, grandchildren, parents, grandparents and those whose names were in the same census registration at the time of the death of the accused.

As compensation for unlawful arrest or detention, a sum of less than 5 yen is paid against the warrant of arrest or for each day of detention after the arrest or for each day of detention after the execution of the warrant of detention.

As compensation for penal servitude, imprisonment, or detention, a sum of less than 5 yen is paid for each day of the whole period. The same rule applies to detention before the execution of the death penalty.

As compensation to the bereaved of a person who has mistakenly suffered the death penalty, a sum of money considered reasonable by the Court is given in addition to the compensation for detention.

As compensation for a monetary penalty or fine wrongly imposed, the amount of money corresponding to that of the monetary penalty or fine already paid is given back. In case a person was unable to pay the amount imposed and in lieu was kept in a Labour House, a sum of 5 yen for each day of detention is paid as compensation.

Claims for compensation should be made to the Court returning the verdict of "not guilty", or to the Court in which the examining judge pronounced the acquittal.

A Survey on Crimes The number of criminal code offences, first instance, was from 100,000 to 110,000 in the early part of the Taisho Era (1912-1917), but began to lessen in 1920 and stayed between the 80,000 and 90,000 mark for years. In 1933, it began to increase again and went over the 120,000 mark in 1934, the record high since 1912. The proportion to population was, on the average, 20 in every 10,000 in the early part of the Taisho Era, 16 in 1920 and 17.86 in 1934.

Comparing crimes in 1912-1915 with those in 1930-1933 the largest number pertained to gambling and lotteries, but these lessened from 10 to 7 in every 10,000 of population, those of theft from 4 to 3, of fraud from 2 to 1, and of usurpation from 1 to 0.4. On the contrary, the proportionate number of inflicting injuries increased from 1 to 1.4 and that of the unintentional inflicting of injuries from 0.1 to 0.8. Those of murder, burglary or incendiarism kept 0.1 in both periods.

In 1934 the total number of convictions in Japan proper was 120,854, of which gambling and lottery accounted for 59,145 or 48.9 per cent, theft for 21,748 or 18 per cent, inflicting injuries

Digitized by Google

10,299 or 8.5 per cent, fraud and threat 7,416 or 6.1 per cent, unintentionally inflicting injuries 6,226 or 5.2 per cent, usurpation 2,974 or 2.5 per cent, murder 1,041 or 0.86 per cent, incendiarism 938 or 0.77 per cent, and burglary 797 or 0.65 per cent.

When divided into crimes committed in city areas and those in country areas, the number of the former was 90,162 or 41.65 in every 10,000 of city population and that of the latter was 30,692 or 6.59 in every 10.000 of the country population.

Taking totals according to prefectures, Tokyo prefecture led others with 17,878, Osaka came next with 10,454, Hyogo 7,654, Aichi 5,749, Hokkaido 5,383 and Fukuoka 5,211. All other prefectures had less than 5,000 each, those which had less than 1,000 were Okinawa 472, Yamagata 634, Tottori 677, Ishikawa 680, Shimané 782, Miyazaki 790, Tokushima 820, Iwaté 863, Fukui 985 and Miyagi 996.

In proportion to every 10,000 of population in prefectures Tokyo again led with 29.11, followed by Kanagawa 27.80, Hyogo 27.35, Okayama 27.02, Osaka 26.66, Oita 25.34, Kyoto 24.77, Nara 24.77, Nara 24.22, Wakayama 22.69 Aichi 20.80. Hiroshima 20.30, and Yamagata came last with 5.65.

In proportion to every 10,000 of population in prefectures, according to the kinds of crimes, in gambling and lottery Kanagawa headed the list with 18.4 followed by Nara, Tokyo, Hyogo, Ota, Wakayama, Osaka, Kyoto, Okayama, Mié and Chiba, all exceeding 10. Kagoshima had the smallest number with 1.18. In general the districts around Tokyo and Osaka had the highest proportions while Tohoku (northeast) and Kyushu had the lowest proportions. In theft Osaka came first with 7.36, next came Tokyo with 7 followed by Kyoto, Aichi, Hyogo, Fukuoka, ending with Akita's 0.76. In this crime Tohoku districts had the least number again. In inflicting injuries Okayama was the highest with 3.87 followed by Ehimé, Hyogo, Yamanashi, etc., Nagano being the lowest with 0.57. In fraud and threat Kyoto came first with 2.33 and Okinawa was the last with 0.41. In unintentionally inflicting injuries Kanagawa came first with 1.90 followed by Tokyo, Kyoto, Osaka, Hyogo and other prefectures and Yamaguchi ended the list with 0.15. In usurpation the first was Okayama with 1.45 and the last was Kagoshima with 0.2. In murder Fukuoka came first with 0.32 and Aomori, Ishikawa and Miyagi came last 0.5 each. In incendiarism Akita came first with 0.37 and Kyoto came last with 0.04. In burglary Tokyo and Kanagawa headed the list with 0.25 each and Kochi closed it with 0.01.

New System for Arbitration of Domestic Disputes

The Law for Arbitration of Domestic Disputes, which was promulgated on March 16, 1939, after having been introduced in the 74th Diet by the Government and duly passed by the two Houses, is an important piece of legislation designed to make it possible for disputes between family members or relatives and other domestic contentions to be settled amicably through the arbitration of a law court or of an arbitration committee organized within a law court.

Already in force along lines similar to the Law are such systems for arbitration under the jurisdiction of the Department of Justice as the Law for Arbitration of Disputes Concerning Leased Land and Rented Houses (effective from October 1, 1922), that for Arbitration of Tenancy Disputes (effective from December 1, 1924), that for Arbitration of Commercial Disputes (effective from November 1, 1926) and the Provisional Law for Arbitration Concerning Monetary Obligations, all of which are functioning satisfactorily. Compared with cases coming under these laws, no one will hesitate to declare that domestic disputes are far better suited to arbitration. Especially in view of the habits and customs traditional to the Japanese people, no one will fail to see the need of making it possible for domestic disputes to be settled amicably through arbitration. Indeed, the four laws of arbitration previously existing may be said to have been intended as preparations for the introduction of arbitration for domestic disputes.

Thus, with the need for a system of arbitration of domestic disputes having been felt in various quarters for many years, the present Law must be said to have been late in coming into existence. This delay has been largely due to the preparations which have been under way at the Department of Justice for more than a decade for the radical revision of the Book on Relatives and the Book on Inheritance in the Civil Code, on the basis of recommendations submitted by the Temporary Legislation Council. A tentative plan for the desired revisions has already been drawn up and is now in the course of re-examination. At the same time it

Digitized by Google

is being planned, on the basis of one of the recommendations of the said council, to institute the Court of Justice for Domestic Disputes, "in order to settle matters concerning families with sympathetic considerations in line with moral principles." Therefore, the policy previously followed in this connection favoured putting the system of arbitration of domestic disputes in effect simultaneously with the projected revision of the Civil Code and the institution of the Court of Justice for Domestic Disputes.

After the outbreak of the present conflict with China, however, an increasingly urgent need has been seen of facilitating amicable settlements of all domestic disputes speedily through mutual concession between the parties concerned and on the basis of legal principles and human sympathy, so as to enable the soldiers on frontline duty to fight without worrying about the troubles which they have left unsettled at home and also to make the nation-wide cooperation in supporting those on the China front effective to the fullest possible extent. Thus, the establishment of the system of arbitration of domestic disputes has become a matter of urgent necessity permitting no further delay. For this reason, the present Law has been legislated ahead of the projected revision of the Civil Code or the institution of the Court of Justice for Domestic Disputes. As for the introduction of the last-named system, which is to function beyond the limits of the Civil Code or of the newly-instituted system of arbitration for domestic disputes, necessary preparations are now being pushed vigorously and the said system is expected to be brought into being shortly.

Some Details This Law consists of only twelve articles, which contain only such stipulations as are exclusively needed in arbitrating domestic disputes; those provisions of the Law for Arbitration Concerning Leased Land and Rented Houses, which are also suited for arbitration in domestic disputes, are made invocable for the present Law as well.

(1) Article 1 makes it clear that this Law has made it possible for an application to be filed for arbitration in cases concerning domestic disputes, stipulating that "an application may be filed, under the present Law, for arbitration for disputes between members of a family or relatives, or other cases generally concerning family affairs." Members of a family, as stipulated in Article 732 of the Civil Code, include those relatives of the head of the family and their spouses who live in the latter's home, while the term relatives denotes blood relations of the kinships within six degrees and their spouses as well as legal relations within three degrees in kinship, as stipulated in Article 725 of the said code. Disputes other than those between these persons, if they are domestic disputes between those similar in position to these persons or other cases generally concerning domestic affairs, may also be brought up for arbitration. For example, a marriage or the adoption in a family of a person as legal son or daughter is made lawful when it is duly registered (Articles 776 and 847 of the Civil Code), and even if two persons live together as husband and wife or as parent and son or daughter after duly holding a ceremony to solemnize such union, they are not, legally speaking, husband and wife or parent and son or daughter unless they are duly registered as such. Nevertheless, a domestic dispute arising between these persons or between one of them and some other member or relative of the other's family may be made subject to arbitration under the present Law. Further, such disputes as one between an illegal son not legally recognized yet and his actual father or a member or relative of the latter's family may also be interpreted as corresponding to domestic disputes under this Law.

(2) Article 2 elucidates the fundamental idea of arbitration for domestic disputes. Such arbitration is primarily intended to make it possible for an amicable settlement satisfactory to both parties concerned to be reached in a domestic dispute in line with ethical principles and within the limits of law.

(3) Articles 3 and 4 stipulate the distinctive jurisdiction under which arbitration is to be instituted under the present Law. According to these stipulations, an application for arbitration should be filed at the Local Court in the area under whose jurisdiction the other party of the dispute lives or at a Local Court jointly chosen by both parties. And in case a law court has received an application for arbitration for a case which does not come under its jurisdiction, the said court is, as a principle, to refer the case to the right court by decision instead of rejecting the said application for acceptance. However, so far as domestic disputes are concerned, these stipulations concerning the jurisdiction of a law court need not necessarily be stretched too far, as it often happens

Digitized by Google

that a better result is obtained by allowing reasonable discretion to suit actual circumstances.

For instance, in case a senior member of the family concerned lives at a place other than the locality of the residence of the other party of a domestic dispute and when it is considered advisable to work for the required arbitration with the participation of the said senior member, it may be arranged that the case be dealt with at the Local Court of the area under whose jurisdiction the said senior member lives. Therefore, in case a law court has received an application concerning a case which does not come under its jurisdiction and when it sees sufficient reason to do so, the said law court may refer the case to a Local Court other than that under whose jurisdiction the case ordinarily comes or may deal with the case itself without referring it elsewhere. Further, even in case a law court has received an application for arbitration in a case which comes under its own jurisdiction, the said court may refer it to another Local Court by decision when it deems it appropriate to do so. Such flexibility provided for the jurisdiction of a law court in handling cases under the present Law undoubtedly is well adapted to arbitration of domestic disputes.

In this connection, it is further stipulated that no exception can be taken to the decision awarded by a law court.

(4) Article 5 stipulates that an application for arbitration in a case involving an unreasonable cause should be rejected. In the other systems of arbitration, too, it has been laid down that applications for unreasonable purposes should be rejected, but in that article it is further stipulated that applications which are not in keeping with good custom should also be rejected. Applications which are not in keeping with good custom are likely in many cases to be intended for the abuse of rights or other unjustifiable purposes, but even in cases where such intentions are not involved, it has been laid down that applications not in keeping with good customs should be rejected, inasmuch as arbitration in domestic disputes is based on the spirit of respect for customs and habits traditional to the Japanese people. Furthermore, it is stipulated elsewhere (Article 11) that an arbitration committee may desist from arbitration in case it is deemed that such causes as stipulated in the present article are involved.

(5) In Article 6 it is stipulated that the parties involved and those otherwise interested in a case for arbitration should present themselves personally, but that they may send their representatives in case they are unavoidably prevented from presenting themselves, and that those other than lawyers are required to obtain permission of the law court concerned in order to become such representatives. It is noteworthy in this connection that this article makes it clear that lawyers acting as representatives in a case for arbitration need not obtain special permission, whereas previous systems of arbitration have required lawyers to obtain the permission of the law court concerned.

(6) In Article 7 the legal force of arbitration is defined to the effect that arbitration has the same force as in judiciary conciliation, a party being liable to be subjected to immediate compulsory enforcement in case he fails to live up to the obligation which he has incurred thereby. Further, the arbitration effected by an arbitration committee becomes similarly effective only when it is approved by the law court concerned by decision (Article 8 of the present Law and Article 28 of the Law for Arbitration of Disputes Concerning Leased Land and Rented Houses). This stipulation is common to all other systems of arbitration but in the case of arbitration of domestic disputes, there is an accompanying provision that this stipulation does not apply to such obligations as involve matters which do not allow disposal by the party concerned, because in cases concerning domestic disputes there may be various matters for arbitration other than deliveries of goods or payments of money and it is impossible to make the result of arbitration equally effective on certain of such matters.

(7) Article 8 names a number of stipulations of the Law for Arbitration of Disputes Concerning Leased Land and Rented Houses, which are made applicable to corresponding cases under the present Law. Some of these stipulations are explained below.

Article 2 of the Law for Arbitration of Disputes Concerning Leased Land and Rented Houses, which stipulates that an application for arbitration is required to make clear the actual situation of the dispute at issue, has been made applicable to applications to be filed under the present Law as well.

Again, by the invocation of Paragraph 2 of Article 4 of the same law, a law suit pending at a law court concerning a domestic dispute can be referred to arbitration by the law court, which has

Digitized by Google

accepted the suit, through the exercise of its own authority. Thus, cases which are considered better suited to amicable settlement by arbitration than by law suit proceedings may be referred to arbitration by the law court concerned without waiting for an application from the party involved.

In case a law suit is pending in connection with the case for which an application for arbitration has been received or in case a law court has referred a case to arbitration through the exercise of its own authority, the proceedings of the said law suit are to be suspended pending the closure of the arbitration (Article 5 of the same law). As it would be unwarranted to keep a law suit in progress while referring its case to arbitration for amicable settlement, it has been laid down that in such cases, proceedings of the said law suit are to be suspended so as to make it possible for the best efforts to be made for the benefit of arbitration. However, in case an application has been filed for such arbitration with the object of shunning reasonable obligations under cover of this stipulation, the said application is to be rejected under the provisions of Article 5 of the present Law.

Cases for arbitration come under the jurisdiction of a law court or an arbitration committee, and in practice, the law court is to take charge of simple cases of arbitration, while the committee is to deal with complicated cases, but in case both parties involved so desire, the arbitration committee is required to sit for their case (Paragraph 2 of Article 14 of the previous law). In the case of a law court undertaking arbitration, the said law court is required to fix a date and summon the applicant for such arbitration and the other party involved on that day in case it has accepted an application for arbitration or has referred a law suit it has accepted to arbitration, the law court being authorized to request the presence of persons otherwise interested if it is deemed necessary to do so (Article 6 of the previous law).

Proceedings of arbitration are not to be opened to public hearing; it is stipulated that only those whom the law court concerned considers duly qualified may be permitted to witness the proceedings as visitors (Article 8 of the previous law). This stipulation is common to all existing systems of arbitration, but it is of special necessity for arbitration in domestic disputes because the parties involved or those otherwise interested will not be able to state their actual cases fully and express their real intentions unless the proceedings are closed to the public.

Another article of the said law made applicable to cases under the present Law is Article 13 which authorizes the law court concerned to order action as may be deemed necessary prior to effecting arbitration. For instance, in case a dispute has arisen between members of a family or its relatives regarding the partition of an estate, the said estate may thus be caused to be held in trust by a senior member of the family until arbitration is effected.

Further, in case the action thus ordered by the law court concerned requires expenses, one of the parties or both of them may be made to pay for such expenses in advance (Article 9 of the previous law). An application or other statements for arbitration may be made either verbally or in writing (Article 10), and the findings of arbitration are to be prepared by the clerical staff of the law court concerned (Article 11).

As for the organization of an arbitration committee, the said body is to consist of a chief arbitrator and two or more members (Article 15 of the previous law). The chief arbitrator is to be appointed annually from among the judges by the Chief Justice of the District Court concerned (Paragraph 1 of Article 16). The members of the Committee are to be named annually in advance by the Chief Justice of the District Court; and from among these committee men, suitable persons are to be chosen for each case by the Chief Arbitrator. If arbitration is to be expected to lead to its rightful results, it is obvious that the most suitable persons available ought to act as members of the committee, and for arbitration in domestic disputes it is stipulated that those who serve on the committee should be persons of good reputation as their first qualification. Further, the committee men are to be paid a daily allowance and travelling and hotel expenses (Article 18).

Proceedings of arbitration at the committee meetings are to be directed by the chief arbitrator (Article 19), and the committee's decisions are to be authorized by a majority vote of the members, the chief arbitrator having the casting vote in case of an equally divided vote (Article 20). Discussions in the meetings are to be kept in confidence (Article 21), while the committee is authorized to summon the parties involved, to request for the par-

Digitized by Google

ticipation of those interested at a date it fixes, to give permission to their representatives to present themselves on their behalf, or to order action as may be deemed necessary before arbitration is effected (Article 22 of the previous law and Article 10 of the present law). The arbitration committee is also authorized to hear the statements of the parties involved or those otherwise interested and to institute examination of evidences in case it is deemed necessary to do so (Article 26 of the previous law). These stipulations are common to all the other systems of arbitration.

In case the arbitration committee has concluded that an application for arbitration is not in keeping with good customs or is intended for the abuse of rights, the said committee is authorized to desist from instituting arbitration as stated before (Article 11 of the present Law).

In case arbitration is effected by a commitee, the law court concerned is to be furnished with a report of the chief arbitrator and will then decide to approve or not to approve the arbitration thus effected. Such decision for approval invests the arbitration effected with the same power as in judiciary conciliation, provided that the law court concerned is not authorized to decide for disapproval of the arbitration effected unless such arbitration is considered unfair to a serious extent (Articles 26-28 of the previous law).

In case the parties involved do not respond to the summons of the arbitration committee without justifiable reasons, the law court in charge of the case for arbitration concerned, after consulting the committee, may sentence them to fines of ₹50 or less (Article 32 of the previous law).

It is also stipulated that a fee is to be paid for an application made for arbitration by the arbitration committee or by the law court (Article 29 of the previous law). The amount of the said fee still remains unfixed, but it is likely to be fixed at an amount not exceeding 50 sen. The parties involved or those otherwise interested may request the clerical staff of the law court concerned to show them the records of their case or give them an exemplified copy, certified copy or extract copy of the said records or a certificate concerning the case (Article 30 of the previous law).

(8) The stipulations contained in Articles 9 to 11 of the present Law have already been dealt with. In Paragraph 1 of Article 12, it is stipulated that in case a member of the arbitration committee or one who has formerly been on the committee, without reason, disclosed what were the views of the chief arbitrator or the other members or whether the said views were the majority or minority views, the said person is made subject to a fine not exceeding ₹1,000, this stipulation being aimed at securing freedom and fairness for discussion at the committee meetings. Designed for similar purpose is the provision of Article 49 of the Law for Arbitration of Tenancy Disputes. Then, Paragraph 2 of the article in question stipulates that in case a member of the committee or one who has formerly been on the committee has, without sufficient reason, disclosed the secrets of another person which he has learned in connection with matters he has handled during the execution of his official duties, the said offence is to be made liable to a sentence of three months or less in penal servitude or a fine of ₹1,000 or less. This stipulation of punishment is peculiar to the system of arbitration for domestic disputes. This is because arbitration of domestic disputes affords considerable chances to learn family secrets, which are likely to cause great disadvantages for the parties involved or those otherwise interested, unless they are kept strictly confidential, thereby standing seriously in the way of arbitration for domestic disputes.

(9) In the systems of arbitration for disputes concerning leased land and rented houses, tenant farming and commercial affairs, it has been laid down that in case an arbitration committee fails to effect arbitration, the committee is to decide on terms of arbitration as may be deemed appropriate and send copies of its findings to the parties involved. It is stipulated that in case the parties involved do not take exception to such terms of arbitration within one month after receipt of the said copies, they are to be considered to have accepted the proposed arbitration. Further, in the systems of arbitration in disputes concerning monetary obligations and tenant farming, it is so stipulated that the law court concerned may administer justice in lieu of the so-called arbitration. However, neither of these two devices has been incorporated in the present Law. The reason is that domestic disputes often involve details which are too complicated to be made subject to these devices, and also that in such disputes, the intentions of the par-

Digitized by Google

ties involved in particular ought to be respected in a greater degree than in the arbitration for disputes concerning other problems.

Statistics

The following are the statistics relevant to the judicature of the country:

NUMBER OF COURTS (June, 1938)

	Supreme Court	Courts of Appeal	District Courts	Branch Courts	Local Courts	Branch Offices
	1	Tokyo	12	17	64	417
		Osaka	9	12	43	280

Prison System

Historical Background

A short historical retrospect of our penal system will show that it is only in comparatively modern times that "Imprisonment" became the recognized method for the punishment of crime.

Up till recent times the idea at the root of the Japanese penal system was minatory. In other words, the so-called principle of general prevention by warning the people at large against the commission of crimes by imposing heavy punishments upon criminals was adopted. Accordingly, the punishments were principally capital and corporal and extremely cruel in character. For instance, the Criminal Code of the Yédo Period (1602–1867) recognized the exposing in public of the heads of persons executed; crucifying, burning at the stake and other similar cruel punishments were imposed. In those days the jails were used merely as places of detention for various offenders until their trial, not as places for reforming offenders. Imprisonment was a very unusual form of punishment, for prisons were unknown and imprisonment was not a legal penalty.

Exile and Banishment Punishments which brought loss of liberty for specified periods to the criminal were exile and banishment. Persons punished with exile were sent to distant islands and places such as Satsuma, islands of the Goto group, Oki, Iki and Amakusa, and there they were forced to work under such miserable conditions that most of them died of starvation. Banishment was a penalty designed to expel persons convicted of crimes from certain fixed areas, and, as the result of the enforcement of this punishment in certain districts industries declined and farms and fields lay waste, giving rise to many social evils such as the increase in the number of ronin (masterless samurai), mushukumono (vagabonds) and other dangerous elements. In 1778, therefore, as a remedial measure, the Tokugawa Shogunate instituted the system of kozan-yékifu (mine labour) and, in 1790, that of ninsokuyoseba (places for the detention of convict-coolies). The system of kozan-yékifu dealt with vagabonds with no previous convictions. These were sent as coolies to pump water out of the Sado goldmine. In and after 1788, those who had been punished by flogging or branded as ex-convicts by tattoo marks and were homeless or those who, it was feared, might perpetrate crimes in the future were also sent there.

Prototype of Present Prisons The ninsoku-yoseba were to all intents and purposes the prototype of present day prisons and penal servitude. These places for the detention of convict- coolies were located at Ishikawajima and Tsukudajima in Yédo (Tokyo) and at Kamigo, Ibaraki prefecture, and there vagabonds and those who had been punished by flogging or branded as ex-convicts by tattoo marks were detailed to work as oil pressers or at other kinds of labour for a fixed wage, with the ulterior object of giving them such instruction and training as would fit them to lead the lives of respectable members of society. In and after 1820 those who were punished with banishment heavier than that from the confines of Yédo were put to forced labour for a fixed period of time in lieu of that punishment. Thus the ninsoku-yoseba, which had been instituted as workhouses for vagabonds, were turned into prisons for the reclamation of criminals through ordered life and labour. In its correctional idea ninsoku-yoseba was entirely identical with the London "Bridewell," which was established in England in 1550 "to punish, correct, and reform by labour of a diversified nature," and the Amsterdam workhouse (tuchthuis) founded at the end of the 16th century and well known for its motto, "Schrick niet ! ick wreeck geen quaet, maer dwing tot goedt, straf ist myn handt, mar lieflijck myn gemoedt." (Do not fear ! I will not take revenge upon you for your misdeed; on the contrary, I wish to lead you to good. Although I am rigorous in handling you, my heart is filled with kindliness towards you.) In and after 1790 the prisoners detained in the ninsoku-yoseba who behaved well and showed notable signs of penitence were liberated on certain conditions and this may be taken as the

enforcement of provisional release of prisoners for the first time in Japan. When it is remembered that the system of provisional release of prisoners in Europe originated in a favoured release of prisoners from a convicts' colony in Australia in 1791, it is an interesting coincidence that the same system was inaugurated simultaneously both in the West and the East.

Improvement of 1872 In 1871, with a view to carrying out a great improvement in our prison system, the Emperor Meiji despatched the Vice-Director of Prisons, Mr. Jinsai Obara, to Hong Kong and Singapore to inspect and study the prison systems there, and, as a result, the Prison Regulations, the first written law concerning prisons in Japan, were promulgated in 1872. According to the provisions of these regulations, the reclamation and education of the inmates of prisons should be based on love and benevolence. At the beginning of the Regulations, it is stated: "Prison is a place for the incarceration of criminals for chastisement. They are placed there because of love and benevolence towards them and not because of any desire to inflict cruelty upon them; prison is intended for chastising them and not for subjecting them to hardships. Punishment is imposed on them because it is unavoidable and because it is a means of removing evil from the State. The authorities of prisons shall conscientiously observe this principle in treating prisoners." The Regulations were framed on a progressive system and on very advanced lines, but subsequently their operation was suspended for a time, and, in 1881, the Revised Prison Regulations were published. The Regulations were again revised in 1889, and with the revision of the Criminal Code in 1907 the existing Prison Law was enacted and published the following year.

Management of Prisons

Prisons are placed under the control of the Minister of Justice. Prior to 1900 they were under the control of the Minister of Home Affairs, but since that year they have come under the supervision of the Minister of Justice. With the transfer of affairs relating to prisons from the Department of Home Affairs to the Department of Justice, the Bureau of Prisons was established in the latter Department for the administration of matters concerning the execution of sentences, prisons, provisional releases of prisoners, and the identification of criminals by finger-prints. A director, several secretaries, a hygiene official of the Department, several clerks and three assistant-experts in finger-prints were appointed to conduct the business of the Bureau.

In 1938, there were 52 ordinary prisons, 3 reformatory prisons for minors, and 105 branch-prisons, and 1,215 detention rooms in police headquarters.

The kinds and number of prison officials at the end of 1937 were as follows:

Governor	43
Assistant-governors	34
Doctors	93
Chaplains	143
Instructors	37
Industrial work experts	440
Pharmacists	54
Chief warders (including 5 chief wardresses)	524
Interpreters	4
Warders	7,088
Wardresses	129
Total	8,589

Prison superintendents are appointed from among officials ranking as governors and assistant-governors by the Minister of Justice, and branch-prison governors from among assistant governors and chief warders.

Classification

In the Japanese prison system there are four kinds of prisons: (1) prisons for those sentenced to penal servitude; (2) prisons for those sentenced to imprisonment; (3) houses of detention for persons destined to spend time in detention, and (4) prisons of confinement for (a) those sentenced to death, (b) those awaiting trial. In view of the different characters of these prisons, they should, in principle, be established independently of one another, and, in the case of their being erected in the same area, they are usually separated. At present, workhouses are not classified as prisons, but are attached to prisons for the sake of convenience.

Treatment of Prisoners

Object of Treatment As to what is the primary and fundamental purpose of punishment by imprisonment, nothing is stated in the Criminal Code or in the Prison Code now in force. Some Japanese jurists are of opinion that punishment must remain in its essence retributive and deterrent, and accordingly a prisoner must be made to expiate his offence by a dull, soulless, and monotonous servitude. But such new scholars of criminal law and penology as Dr.

Digitized by Google

Yeiichi Makino, Professor of Criminal Law, Tokyo Imperial University, Prof. Kameji Kimura and Dr. Akira Masaki, former Assistant Director, Bureau of Prisons, Department of Justice, interpret it as a form of education and emphasize its socializing effects. Be that as it may, Japanese juridical authorities have for more than ten years endeavoured to reform prisons on the latter principle. On April 4, 1924, Dr. Kisaburo Suzuki, the then Minister of Justice, declared at a meeting of officials connected with prisons and criminal affairs, "The enforcement of punishments consists in the adoption of such measures as may improve the quality of convicted persons and socialize them as good and law-abiding members of society." Further, at a meeting of the governors of prisons and reformatory prisons for minors, held on October 11, 1927, Kado Hara, the then Minister of Justice, gave the following instructions:

"The object of enforcing punishments on the inmates of prisons is to cause them to reflect on and repent their offences and to turn them into good members of society. There are many and various means of attaining this object, but they are, in the final analysis, to cultivate their character, to give them training for different occupations, and to maintain their health in good condition, while improving the circumstances which constitute the causes of their offences so as to enable them to lead a decent life. In order to realize the end aimed at, therefore, a mere confinement and watching of them is not sufficient; on the contrary, it is necessary to know their individual characteristics and to inquire into and ascertain the motives and causes of their crimes, giving them thereby appropriate treatment."

Classification System Inasmuch as punishment by the restriction of personal liberty is enforced today principally with a view to education, criminals are properly classified according to ages, characteristics, terms of imprisonment, numbers and kinds of offences, and are then confined in different prisons so as to facilitate the enforcement of adequate measures for their education in accordance with their categories and, further, to prevent prisons from becoming breeding-places of crime through mutual contact and contagion as the result of promiscuous confinement of all grades. When it is impossible to distribute them among independent prisons and they are confined in the same area, prisoners are usually classified strictly, and confined separately, according to their categories. There are prisons for minors at Odawara, Kawagoyé, Himéji, Okazaki, Iwakuni, Kurumé, Morioka, and Hochiojo, and in Hokkaido for the confinement of those under 18 years of age sentenced to penal servitude or imprisonment, prisons for aged persons at Hamamatsu and Yonago and for women at Tochigi, Miyoshi and Miyazu. Further, there are prisons for the confinement of persons sentenced to terms of imprisonment exceeding 10 years at Kosugé, Takamatsu, Hiroshima, Okayama, Miyagi, and Abashiri; the Abashiri agricultural prison is intended for training prisoners as agricultural labourers. At Uraga, located in an old warship anchored off the port, is a branch of the Odawara prison for minors. There juvenile offenders are given training as fishermen, and sometimes engage in coastal and deep-sea fish-vessels or steamers.

In addition to the above-mentioned classified confinement, with a view to proper individualized treatment, they are examined by doctors, alienists, psychologists and educationists to find out their psychopathic idiosyncrasies, hereditary natures, physiological peculiarities, adaptabilities to occupations, educational possibilities, etc. in different prisons previous to their confinement. Further, a "social diagnosis" is made by collecting reports on them from city, town and village offices, police stations, schools, and organizations devoted to their protection in order that they may be suitably classified for treatment.

Progressive System A treatment on the progressive system is accorded to convicts who form the bulk of the inmates of prisons. This treatment aims at leading them to repent and their treatment is graded in proportion to their aspiration and diligence, thereby gradually bringing them to the conditions of ordinary social life. The relaxation of the enforcement of penalties not merely extends the scope of the personal liberty of convicts, but serves to cultivate a sense of responsibility on their part and strengthens their will for self-reclamation. In short, its chief purpose is not to make "good convicts", but to turn them into "good citizens." The treatment in question does not apply to persons who are sentenced to imprisonment for less than 6 months, aged and decrepit persons, and those of unsound mental or physical faculties. Any prisoner committed for the first time is kept in solitary confinement for a certain period of time and a close study is made of him. On the basis of the results he is classified according to character, physical and mental con-

Digitized by Google

dition, number of convictions, age, nature of crimes, term of service, home, health and thought.

The Four Stages The stages of the progressive treatment are: (1) those under investigation; (2) those in course of correction and training; (3) those in process of improvement; and (4) those who have developed a sense of responsibility. After being subjected to a study of character, convicts are received into the first class to begin with. Those who are accorded this treatment are given fixed marks according to their terms of imprisonment and promotion to higher classes is given only when a sufficient number of marks have been earned by diligence, good conduct, and growth of the sense of responsibility and of the will for self-improvement. Those belonging to the first and second classes are kept in confinement in association, while those belonging to the third class are kept in confinement in association in the day time, but in solitary confinement at night, those belonging to the fourth class are confined in a special room.

The Treatment Governors of prisons may cause convicts in each workshop to elect some from among them to keep the workshop in good order and look after other necessary matters. The elected ones must be popular, trustworthy and belong to the third class. Prisoners belonging to the third class must jointly, once a month, carry out the work of cleaning and sweeping the prison grounds and keeping them in order. Except in cases of special need, prisoners belonging to the fourth class do not undergo physical examination or have their cells searched, and, further, are permitted to talk with one another so long as it does not interfere with the maintenance of discipline. They are also permitted to elect two representatives that they may express their desires to the authorities. These representatives are nominated by the governor of the prison concerned from among several candidates elected by prisoners belonging to the fourth class. Prisoners of the fourh class may be permitted to take walks in a place designated for that purpose in the prison grounds in hours of recess, or hold meetings, take walks in a group, or hold athletic meetings on days free from labour. They give a pledge to the governor, holding themselves responsible for the physical examination of those of their own class, for the search of their cells and keeping them in order, and the maintenance of order among themselves. In case of any one of them violating the pledge, the privileged treatment will be suspended for some or all of them. Any one of those belonging to the first class who earns more than ¥5.00 for labour may be permitted to use less than one-fifth of the monthly total in buying postage stamps and in other ways that are deemed necessary; any one of those belonging to the second class, less than one-fourth of the monthly total; any one of those belonging to the third class, less than one-third of the monthly total; and any one of those belonging to the fourth class, less than one-half of the monthly total. While those of the first class are not permitted to change the kinds of labour they engage in, those of he second class and up are permitted to do so. Those who have superior skill or high efficiency and belong to the third class are charged with the task of directing industrial work and those who are similarly qualified in the fourth class are given the task of directing and supervising it. Those of the third class who have particularly superior skill and high efficiency are permitted to work for their own profit in time other than working hours, but that time is limited to two hours per day.

Moral Education Prisoners belonging to the first and fourth classes are chiefly given individual moral and religious instruction, while those belonging to the second and third classes receive the same instruction en masse. Listening to music broadcast on the radio and listening to the playing of gramophone records is permitted to those belonging to the second and higher classes. The time for the enjoyment of this privilege is fixed at twice a month for those belonging to the second class, which may be increased to three times and four times for those belonging to the third and fourth classes respectively. The governor may permit members of the third and fourth classes to hold moral cultural meetings, the number of times being limited to once for those belonging to the third class and twice for those belonging to the fourth. Prisoners of the fourth class are permitted to read books or see pictures in the prison library on days free from labour, and may also borrow suitable newspapers and magazines from it. Those of the third and fourth classes may be permitted to play athletic games, the number of times for such amusements being limited to once a month for those of the third and twice for those of the fourth class. While those belonging to the first class

Digitized by Google

are permitted to interview or send letters only to their relatives and those who are concerned with their protection, those belonging to the second and higher classes are permitted to interview or send letters to those who do not interfere with their moral instruction, besides their relatives. The number of interviews and the number of letters that may be written increase in proportion to advances in class.

Provisions, drinks and other articles for the maintenance of the health of prisoners are uniform and do not differ according to classes. Those belonging to the fourth class are given white garments, are permitted to decorate their cells with flowers or pictures, and are lent table-ware and other sundry articles for common use.

Suspension of Progress In case any prisoner violates the prison regulations, the treatment on the progressive system may be suspended for up to a period of 3 months, but in case it is recognized that there are certain circumstances which have to be taken into consideration before the suspension or in case the prisoner shows signs of sincere penitence the enforcement of the the sentence of suspension may be postponed for a fixed period of time. If he further violates the prison regulations during that period, the sentence of suspension will be enforced, but if he passes the said period without any further violation it will not be carried out. Further, in case a prisoner shows marked signs of penitence after the sentence has been delivered, this will be taken into consideration and the sentence repealed in full or in part. In case a prisoner who has been punished with suspension of the treatment again violates the prison regulations, he may be transferred to a lower class according to the circumstances of the case. When a prisoner who has been punished with such degradation shows marked signs of penitence he will be restored to his former category without reckoning his marks.

When any person of the fourth class has served one-third of his term of imprisonment and the prison governor considers him fit for provisional release his case should be reported on to the Minister of Justice. Even one who belongs to lower classes and who has served one-third of his term and shows notable signs of penitence and is considered to be fully adapted to social life may be specifically granted provisional release, subject to the approval of the conference for provisional treatment on the progressive system.

Prison Labour

Paragraph 2 of the Japanese Criminal Code provides : " Any convict sentenced to penal servitude shall be detained in a prison and subjected to a fixed amount of labour." This " fixed amount of labour constitutes prison labour. It is not legally imposed on convicts punished with imprisonment or custody, but its imposition is permitted in case they desire it. Since the institution of the ninsoku-yoseba at Ishikawajima hard labour has been recognized as an essential part of the discipline of prisoners, and present-day criminal theory in Japan is opposed to punishment by the restriction of personal liberty without the imposition of hard labour. Accordingly, prison authorities are encouraging industrial work at their own request by prisoners punished with imprisonment or custody.

The Three Systems Industrial work in prisons is managed on three systems, viz.: the public account system, the " made-to-order " system, and the contract system. Under the public account system, a prison itself purchases materials, provides itself with the necessary machinery, implements and tools and makes prisoners manufacture or repair articles or carry on labour under the direction of prison officials, and sells the products. Under the " made-to-order " system, the chief materials are supplied by the outside buyers and prisoners either manufacture or repair articles under the direction of industrial work experts and assistant industrial work experts on the prison staff, and when the articles are either manufactured or repaired the wages of the workers and the cost of requisites in the manufacture or repair are calculated and the prices of the articles fixed by the standard of current prices. The articles are then delivered to the buyers on payment of the account. Under the contract system, applicants have to supply not only materials, machinery, implements and tools, but also experts for the direction of work, a prison only offering the labour of prisoners and receiving their wages in exchange. Under the contract system now in force in Japan, the prison authorities undertake the supply of provisions, etc. to prisoners, as well as undertaking their supervision and selection for work, and nothing like the lease system that was in vogue in South American countries at one time is recognized.

Among the above-mentioned three different systems, the public account system does not permit any third party

Digitized by Google

other than prison officials to direct prisoners in the prosecution of their work as in the case of the contract system and, moreover, enables the prison authorities to select and impose on prisoners such kinds of work as are suited for their moral instruction and vocational education. In these respects, it is considered to be the most desirable for the enforcement of penological measures and its adoption is greatly encouraged.

Training for Occupations In imposing work on prisoners, the most suitable kinds of work are given them not only by taking into consideration health, economy, terms of imprisonment, ability, occupations in free life, and future means of livelihood, but also by scientifically examining their individual adaptabilities to occupations. Industrial work in prisons is the most suitable means of giving moral instruction to prisoners; in particular, training them in certain lines of work in the course of detention is the best way to prevent them from perpetrating crimes once again. Since 1926, therefore, houses for the training of prisoners for occupations have been erected in different prisons throughout the country and there prisoners have been trained for occupations requiring special skill, such as those of carpenters, joiners, furniture-makers, tin-smiths, plasterers, timber-mill workers, painters, smiths, shoemakers, etc. The term of training is 6 months, during which fundamental theories and practice are taught.

Rewards Given as Favours Working hours are from 12 to 13 hours a day and differ according to months. It is permitted to give educational or moral instruction to prisoners or allow them to take exercise within these hours. A time of recess—15 minutes in the morning and 25 minutes in the afternoon—is given them. All the income from the work of prisoners goes into the national treasury, irrespective of whether it arises from work or from wages. A prisoner who has worked may receive a reward as a favour. This gratuity varies from ¥0.20 to ¥10.00 per month and the sums are fixed according to conduct, character, kinds of work, and the results of the work done. Any one who does particularly superior work is given an additional reward not exceeding ¥10.00. The reward for his work is, in principle, not given a prisoner until he is released from prison, but (1) in case a prisoner is entitled to ¥10.00 a month or more, and the money is needed to support his father, mother, wife, child, or to compensate the sufferer from his crime, or to purchase books or other necessary articles, one-third of the amount may be given him while in confinement, and (2) in case it is particularly necessary to do so for the sake of a prisoner, the entire reward may be handed over to him, irrespective of its amount and the way of spending it. In case a prisoner has been injured or has fallen sick while at work, and has died in consequence or has become unable to carry on any work, he may be entitled to a pecuniary reward according to the circumstances of the case. This reward is fixed within the limit of from ¥50 to ¥180 according to the details of the case.

The Hito Prisoners are given moral instruction en masse on national holidays, on the first two days of January and the 31st of December, or on Sundays. The same instruction is also given prisoners individually in case it is deemed necessary. It is chiefly given by chaplains appointed from among priests of the Shinshu sect. Adult prisoners who are uneducated and those under age receive an elementary school education. The latter are also given military training, which gives very satisfactory results in the way of moral instruction. Prisoners are permitted to read books and look at maps and pictures, unless it is injurious to the good order of the prison, but writings concerning current topics are forbidden. As, however, it is needful to keep them acquainted with changes in the condition of society, lest they should fall behind the times, a specially edited newspaper, "Hito," (Man) is issued and distributed among them.

Aid of Discharged Prisoners

Criminals come in general from among the poorer people, and when they are released from prisons after the completion of their term they are greatly handicapped in entering into gainful occupations or getting positions in shops or offices, being known as "Zenka-mono" or "former criminals," and dealt with as such by the society, and it becomes difficult for them to earn a livelihood, so that they are forced into further crimes. Of the total number of discharged prisoners the percentage of those who engage in crime a second time within 6 months of their discharge is found to be 43.1, and the percentage of those who commit a crime within another 6 months is 15.4, that is, the percentage of dicharged prisoners who commit a crime for the second time within one year is as high as 58.5. For the protection of the discharged prisoners

Digitized by Google

measures have to be employed for giving moral instruction and a knowledge of some useful arts while providing them with necessary funds so that they may establish themselves in some suitable occupation. These works have been entirely left in the hands of volunteer social workers who have made valuable contributions. But the number of establishments for this purpose is insignificant as compared with the number of the ex-convicts who are in immediate need of protection and the fund contributed by benevolent persons to these protection houses is too insufficient. The trend of times since 1931 is to disregard the need for such social institutions because the attention of the people is drawn to far more important social problems requiring the reconstruction of national life so that little or no attention is paid to the preventive type of social work. Under the circumstances the amount of contributions to institutions for discharged prisoners began to dwindle, while the decreased rate of interest has lessened the income from endowment funds, and to make matters worse, the commodity prices have gone up. The present conditions of protection work for ex-convicts are such that they are far from making any material contribution toward decreasing the percentage of the second or habitual offenders referred to above.

Japan may have achieved much in regard to the efficiency of its procurators and the conditions of law courts and prisons, but the country's accomplishments in that direction will not produce full results unless necessary measures are instituted for the protection of ex-convicts. The only Governmental measure in this respect is that which pertains to thought offenders which became effective in November, 1936, and known as the Protection and Surveillance Law. The good results so far attained, by the establishment of the protection and surveillance stations and the organization of a special commission for the guidance of released thought offenders, has encouraged the authorities to expand the scope of this work, to include ex-convicts. Plans are under way for launching out protection measures for ex-convicts all over the nation by the promulgation or a law which is long overdue.

The Organizations Among these organizations, one noted for its systematic constitution and management was the Shutsu-gokunin Hogo Kaisha (Ex-Convicts Protection Co.) established by Mr. Meizen Kinbara in Shizuoka prefecture. In 1907, the Government decided to make an appropriation of ¥10,000 from the national treasury every year for the encouragement of the work and later, in 1912, the sum was increased to ¥30,000. With the development of the work the number of organizations grew and was returned at 211 throughout the country at the end of 1912. In 1913, Baron Hachiroyemon Mitsui, head of the House of Mitsui, donated ¥750,000 to the work, and with this money the Hosei-Kai, a foundation, was established for the control of, and extension of help to, various organizations interested in the work throughout the country. In 1925, the Government subsidy was increased to ¥100,000, and since 1923, the Imperial House has made an annual grant to encourage the work, with the result that the work has made steady development, the organizations today number approximately 800.

The Beneficiaries The persons protected by these organizations are not limited to those who have served the terms of their sentence, but include those who have been provisionally released; those, whose prosecution is suspended; those, the enforcement of whose sentence is suspended; and those who have been released from punishment for minor offences; as well as the members of the families of those who are detained in prisons. The method of protection is roughly classified into (a) quarters and protection, (b) indirect protection, and (c) temporary protection. Those to whom the method (a) is applied are quartered in places specially selected by the above-mentioned organizations and are given board, lodging and clothes as well as employment. Those to whom the method (b) is applied are not directly protected, but visits are paid to their fixed places of residence from time to time so as to give them advice and suggestions. Those to whom the method (c) is applied are given only temporary help at the time of liberation from prisons such as providing them with clothes and other necessaries and journey money.

Today, there exists in the Department of Justice the Section for the Protection of Ex-Prisoners which undertakes the direction and supervision of the welfare work of various associations, but as it cannot be expected that a small Section can thoroughly undertake such wide-spread work, it is increasingly advocated in different quarters that a system for the promotion of the welfare of ex-convicts should be

Digitized by Google

instituted and the work connected therewith conducted by the State.

Police System

Its Fundamentals

There are two aims of the national administration. One is the administration of political affairs for the direct benefit of the nation as a whole, and the other is to protect the public welfare of the individuals who compose the nation. The function of the police is to look after the latter. There is a judicial function of the police that goes side by side with the first one, but the principal significance of the establishment of the police system is in its protection of public welfare. The work it performs can be considered more in a negative aspect than a positive one for it does not promote welfare work so much as it prevents and roots out matters which are, or may be, detrimental to peaceful social life. The police are endowed with authority to enforce the law or to give orders to the people. Police authority forms a part of the sovereign power of the State.

Authority Vested in State In Japan police authority is entirely vested in the State and is not delegated to other public bodies. In European countries, there are commonly the State police and the local police, the latter being under the jurisdiction of local authorities. In Japan all the police come under the direct administration of the State and no chiefs of local governments or local governments themselves have power over them except in a very few limited subjects. The police are administered in the name of the Emperor by the Minister of Home Affairs through the Superintendent-General of the Metropolitan Police, in Tokyo prefecture, governors of other prefectures and the Hokkaido procurator. Although nominally under the Governor of Tokyo prefecture, the Superintendent-General of the Metropolitan Police Board in Tokyo takes his orders direct from the Home Minister as the Board has many political responsibilities unknown in other prefectures. The appointment is actually a political one, the ordinary police business being carried out by the Chief of Police. In the Hokkaido and other prefectures the highest police official is the Chief of the Police Division. Under the Chiefs of Police are the police superintendents, inspectors, assistant inspectors and policemen. A police superintendent is appointed chief of a police station or secretary of a Police Division, or in Tokyo and Osaka prefectures he may be appointed inspector over several police stations. A police inspector or an assistant police inspector may, in some cases, be appointed chief or seretary of a police station. Policemen are divided into sergeants, indoor and outdoor service men, special service men, and police-detectives.

As mentioned above, police officials carry out judicial functions, and when acting in the capacity of judicial police officials and under the dictates of the public procurators they execute warrants of arrest or detention and arrest persons in flagrant offence. They may seize private possessions or search a house by order of a Court of Justice, an examining judge or a public procurator, or help a public procurator in the investigation of criminal cases.

In Times of Peace and Crisis In times of peace the maintenance of public order rests with the police. Individual policemen wear sabres. Pistols are carried only in special cases though in the police force there are troops of armed constables, while if matters become too serious and on special occasions, the gendarmerie is called on for help. The gendarme is a kind of military policeman, but at such times as the police force is too weak to keep public order, a Governor may ask for the aid of the gendarmerie. Moreover, at a time of crisis or extraordinary social disturbance, the army takes the place of the usual police force and acts with a despotic authority without limitation of the Law. The occasions which may call forth the military power for keeping public order are as follows : (1) when the country or a district is placed under martial law in times of war, (2) when a district is put under martial law for the maintenance of public order, (3) when the governor asks for the help of the army for subduing social disturbances, and (4) when a Divisional Commander recognizes the need of military power for keeping local order in an emergency in which the request from other authorities is too late.

Police Business

Police business in Japan is many-sided, and may be classified into 4 main lines and 24 kinds :

Public Peace (a) supervision of publications. The publication of all kinds

Digitized by Google

of printed matter should be reported and a copy of each must be sent to the authorities. Secret publication is strictly forbidden. A sum of money as guarantee of good faith has to be deposited by the publishers of newspapers or periodicals which deal with political problems. The name of the person responsible for any publication must be printed on the publication. Secret matters which come under the control of the public procurators, the Ministers of War and Marine, and the Minister of Foreign Affairs must not be reported in newspapers or periodicals. The Home Minister may prohibit the publication of a periodical or any other printed matter which he considers detrimental to public welfare and morals.

(b) Supervision and care of public meetings, organization of societies and mass movements. According to the Public Peace Police Law, all public meetings on political questions and some other meetings which come under control of the authorities must be reported to a police-station beforehand. A policeman may be present at such a meeting and may stop a speech or close the meeting. The organization of such associations or societies as may endanger the existing form of Government and system of private property is strictly forbidden. The said P. P. P. Law inflicts heavy penalties on those who break these regulations.

(c) Supervision of businesses or commercial shops. Most businesses are free, but in some cases some kind of police supervision is necessary in the interests of public welfare, hygiene, prevention of damage, the safety of traffic, and social economy. For instance, such shops and businesses as inns, public baths, employment exchanges for geisha and prostitutes, credit information businesses, barbers, seal or stamp engravers, old clothes dealers, peddlers and stallholders are inspected or taken care of by the police. Pawnshops and curio or second-hand shops are under special regulations and police inspection and supervision is thoroughly practised as many stolen articles find their way into these shops, and lead to excellent results in the arrest of thieves and burglars. Guides, scribes and employment exchanges for profit are also under special regulations and strict supervision.

(d) Religion. It is the duty of the police to prevent the desecration of shrines and breaches of the peace in temple grounds. Superstitions and superstitious actions are prohibited by the Police Penal Law.

(e) Accidents. The police take charge in cases of fire, flood, explosion, of people being injured, etc. Regulations are issued on the handling of guns and explosives; the wearing of swords or the like is strictly forbidden; the handling or selling of poison is under a special regulation. Sulphur and oil businesses are under police care also. Buildings are under police supervision for their beauty, fire-proofness, and hygiene; factories, warehouses, theatres, and public resorts receive special attention. Crematories, slaughter-houses and incinerators must not be within residential or commercial districts of cities. Regulations regarding buildings are stricter than in Western countries because of the large number of wooden houses liable to fire and the constant fear of earthquakes. Electricity and gas businesses must not endanger the lives of people. Mines are under a special police regulation as they are most liable to fatal accidents. Prevention of floods also comes into the sphere of police business.

For the prevention and extinction of fires, fire-brigades are established in cities under the control of the Chief of the Police Division in the prefecture. In Tokyo prefecture, a fire division is established in the Metropolitan Police Board and firebrigade stations are located in different parts of Tokyo. In the larger cities, Osaka, Kyoto, Yokohama, Kobé and Nagoya special fire-brigade stations are established by the State. In the smaller municipalities fireguilds are established at the expense of local self-governments. The firemen are volunteers and differ from those in the said cities who are officials of the State.

(f) Public morals. The police look after the maintenance of good public manners and morals. Japan has a licensed prostitute system and forbids private prostitution and conniving at it. Through the efforts of Christian and other religious and public bodies and the growth of other means of pleasure, prostitution is growing less, but it is a duty of the police to see that the prostitutes are treated as humanely as possible as long as their term of service exists. All pleasure resorts such as theatres, places of performances, wrestling, movies, etc. are carefully supervised and any obscene or immoral performances prohibited.

Restaurants, dining rooms, bars, cafes and other eating places are under police supervision. The laws for prohibiting liquors and smoking to minors, the prohibition of lotteries, misbehaviour in the street or outdoors, and the regulations regarding street advertisements and the erection of monuments must be

Digitized by Google

enforced.

(g) The care of men who are a danger to public peace and welfare, juveniles who are addicted to bad habits, ticket-of-leave men, the insane, beggars and vagrants are supervised by the police.

(h) Actions which may harm others such as forcing an interview, extorting contributions, blackmail, causing disturbances, obstruction, etc., are forbidden by the Police Penal Law. Deceitful actions, spreading false reports, and the mishandling of dead bodies come under the care of the police. Obstructing officials in pursuit of their duty is strictly forbidden. The care of lost articles, prohibition of deceitful religious actions, the supervision of "mujin-ko" and "tanomoshi-ko" or mutual financing associations come under police power to some extent.

Public Hygiene The problem of the health and hygiene of the people is one of the greatest concerns of the Department of Home Affairs, and in many points the responsibility of looking after such cannot be confined to the police alone, though in its direct management the police have much to do.

(a) Prevention of epidemics. For the prevention of epidemics there are many laws in force, the most important of them being the Epidemic Prevention Law, the Regulation for the Medical Inspection of Aviators, the Seaport Quarantine Law, the Vaccination Law, the Tuberculosis Prevention Law, the Trachoma Prevention Law, the Leprosy Prevention Law, the Venereal Diseases Prevention Law and the Parasites Prevention Law. The water police help in the medical inspection of passengers and goods arriving in vessels from abroad. The annual compulsory cleaning of individual houses and public buildings, drains, wells, dumping grounds, etc. is supervised by the police. When an epidemic breaks out policemen are used to try and confine it to as small an area as possible.

(b) Medical. As the health and welfare of the people depend on proper medical attention, doctors, dentists, midwives, nurses, masseurs and acupuncturists are under special regulations, as also are druggists and pharmacists. Poisonous chemicals are well looked after.

(c) General Health. A law is in force prohibiting the sale of unwholesome food, and utensils for eating, drinking and preparing food are under police supervision. (See Chapter XXXII.)

Traffic Police (a) Road. The police are responsible for safety on the streets. "Walk and drive on the left" is the rule of the road in Japan.

(b) Vehicles. Railroads, electric cars, automobiles, trucks, waggons, rikishas, bicycles, etc. are under police supervision.

(c) Water police. The water police look after foreign-going vessels entering and leaving open ports, navigation in closed ports, rivers and lakes, and the business of steamship companies doing a coastal trade.

(d) Ocean navigation has many international ramifications and though there are countless matters which ought to come under police supervision it is separated from common police business and put under the administration of the Department of Communications.

(e) The aviation police are put under the management of the Minister of Communications.

(f) Colonial police come under the control of the Minister of Overseas Affairs except in some cases which may come under the supervision of local governments.

Police and the People

The function of the State, as far as it concerns the economic life of the people is largely protective and administrative and certain laws and ordinances of the State have to be imposed on various businesses in order that the people shall be fully protected. The police work by orders from higher authorities at the request of the Ministers of Agriculture and Forestry, Commerce and Industry, and Finance.

(a) Banks, savings banks, mutual financing associations, negotiable security businesses, trust businesses, insurance businesses, commercial exchanges, the central wholesale markets in the six largest cities, foreign trade business in important articles, weighing and measuring machine businesses, and auditors partially are under police supervision or limitations.

(b) Agriculture is supervised by the police in such matters as the prevention of the spread of noxious insects, the control of plants imported or exported, the fertilizer industry, agricultural warehouses, the sericulture industry and the control of rice imports and exports.

(c) The hygiene and prevention of epidemics among domestic animals is looked after by the police. Many laws are enforced regarding the improvement of animals, and police power is needed for a proper practice of them, especially in connection with horse-racing.

(d) Forestry police mainly prevent damage to the forests.

(e) Fishery police protect the pro-

Digitized by Google

pagation of aquatic animals and at the same time look after the safety of the fishermen. There are many laws and regulations on fisheries, whale-fishing, fishing boats, etc.

(f) The hunting of beasts and birds is limited to those mentioned in the revised Game Laws of 1918, the seasons and districts of hunting are put under police regulation.

(g) For the protection of labourers there are numerous laws in force, for instance, the Factory Law, Laws on the limitation of age of factory or marine workers, the Labour Accident Prevention Law, the Mine Law, and the Ordinance regarding the enlistment of workers. Policemen either help factory or mine inspectors or directly handle matters mentioned in these laws. Labour movements and disputes call for the use of police power frequently.

POLICE STATISTICS

	1933	1934	1935	1936
Police offices:				
Police stations	1,199	1,200	1,201	1,203

CHAPTER XXVIII

EDUCATION

Historical Background

Chinese letters and Confucian books were first introduced to Japan in the third century, and it was then that the civilization of the country made a real start. From the nearby peninsula of Korea came sericulture, weaving, brewing, and the art of the blacksmith. It was about his time that the Imperial Prince Wakairatsuko established a Court School.

In the sixth century Buddhism came to the Island Empire to give added material progress to the Japanese civilization, and in 607 the Imperial Prince Shotoku-taishi (see Chapter III) caused the Horyuji Temple to be built at Nara and there he established a shcool in the temple. These were the earliest schools of Japan.

In the latter half of the seventh century a college in the capital and some provincial schools were established to educate officials, according to the Taiho Laws. Later, in the Héian Age, the courses of study became encyclopædic and both public and private schools were established. In the Muromachi Age school education suffered a decline and only two places of study were recorded, namely, the Kanazawa Library and Ashikaga School, although there might have been private lecture halls kept secretly by scribes and Buddhist monks.

The Tokugawa Shogunate encouraged the study of Confucianism and several schools of this moral system and Chinese philosophy were introduced, and education extended to the common people. There were established many schools; the highest one was called the Shohéi Hill Academy or Shohéi School, which was established by the Shogunate. The central government had many other schools, while each local clan government also had its own schools. In addition to these, private schools and "téra-koya" appeared all over the country for the education of the people in general

"Téra-Koya" Education

The "téra-koya" needs some special explanation, as it played the most important part in the education of the masses before the Meiji Era, and laid the foundation for the remarkable progress of elementary education in new Japan.

The word "téra" means Buddhist temple and "koya" children's house, so the téra-koya was a school for chldren established by a Buddhist temple. It was originated many years before the time of the Tokugawa Shogunate by Buddhist monks. Side by side with Governmental schools for the samurai class, téra-koya education began to spread in the Yedo age among the common folks in business and farm quarters. It gradually ceased to be entirely in the hands of the monks, and assumed a form and nature quite different from the original.

The school-house was no longer in or attached to a temple; teaching was not restricted to the monks; the teacher might be a samurai, monk, doctor or Shinto priest. "Téra-koya" became merely a general name, and the founders téra-koya schools chose any name they liked for their own. The size of the schools was diverse, the largest one accommodating as many as two or three hundred pupils. There was rarely more than one teacher, but in the larger schools there might be an assistant. The age of the pupils ranged from 6 to 15 years. It was co-education, although the sexes sat apart. The courses of study were commonly penmanship, Japanese literature, and the use of the abacus, with such optional subjects as Chinese literature, poem composition, sewing, flower-arrangement or tea ceremonies. Many textbooks on moral precepts and letter writing were published and used in these schools. These schools were usually kept up largely out of the pocket of the school master himself, for his work was entirely voluntary, inspired by pure devotion to service, for which he gained the honour and respect of the community. According to the report of the Department of Education, there were 15,862 téra-koya in Japan at the beginning of the Meiji Era, or just before the establishment of the new elementary school system.

It must be remembered also that technical schools had made considerable progress in old Japan. Medical schools

Digitized by Google

in particular were established in the Taiho Era, and medical science made steady progress toward the middle of the Yedo Age. The Tokugawa Shogunate established a medical school in 1765, and local clan lords followed this example. There were several private ones well known to the people. But these taught the Chinese method of the science, and the "materia medica" was almost entirely of herbs and animal matter. The modern or Western medical and its system and practice were introduced through Dutchmen at the end of the Yedo Era, so we may say that medical science was the earliest of all the sciences that were learned by the Japanese people from the Westerners.

Educational Administration

The present educational system of Japan dates from 1872 the 5th year of Meiji, when elementary education was made compulsory. The new system was established, in the main, after the examples of the French system, and the entire country was divided into 7 university districts, each of them consisting of 32 middle school districts and each of which was again divided into 210 primary school districts, or one primary school for 600 of population. The national educational principles are stated in the Imperial Rescript on Education issued on Oct. 30, 1890. This world-renowned rescript was published to lay down leading ideas and principles for the guidance of the Japanese, and it reads as follows:

"Know ye, Our Subjects!

Our Imperial Ancestors have founded Our Empire on a basis broad and everlasting and have deeply and firmly implanted virtue; Our subjects, ever united in loyalty and filial piety, have from generation to generation illustrated the beauty thereof. This is the glory of the fundamental character of Our Empire, and herein also lies the source of Our education. Ye, Our subjects be filial to your parents, affectionate to your brothers and sisters; as husbands and wives be harmonious, as friends true; bear yourselves in modesty and moderation; extend your benevolence to all; pursue learning and cultivate arts, and thereby develop your intellectual faculties and perfect your moral powers; furthermore, advance the public good and promote common interests; always respect the Constitution and observe the laws; should any emergency arise, offer yourselves courageously to the State; and thus guard and maintain the prosperity of Our Imperial Throne, coeval with heaven and earth. So shall ye not only be Our good and faithful subjects, but render illustrious the best traditions of your forefathers.

The way here set forth is indeed the teaching bequeathed by Our Imperial Ancestors, to be observed alike by Their Descendants and subjects, infallible for all ages and true in all places. It is Our wish to lay it to heart in all reverence, in common with you, Our subjects, that we may all thus attain to the same virtue."

The 30th day of the 10th month of the 23rd year of Meiji.
(Imperial Sign Manual)
(Imperial Seal)

All school education in Japan is supervised by the State, being partly entrusted to local public bodies such as the prefectural councils, towns and villages.

Private individuals are also allowed to found schools and universities, although here too the Government does not give much latitude of method or scope, and the uniformity of school education in all parts of the Empire has worked well in bringing the degree of advancement in modern ways and thought to almost the same level throughout the land, and greatly strengthening the national spirit and unity of the people.

The points entrusted to local public bodies are chiefly financial matters, pertaining to the establishment and maintenance of schools, some of which are obligatory while some are left to the discretion of local bodies. The obligatory matters are the establishment by Hokkaido and the prefctures of normal schools, middle schools for boys and girls, schools for the blind and for the deaf-and-dumb, technical schools by order of the Minister of Education, and that of ordinary elmentary schools by cities, towns and villages. Municipalities may not establish higher normal schools, and Hokkaido and the prefectures alone are authorized to establish universities, higher schools and normal schools.

The main principles regarding the nature and objects of schools, their scholastic terms, curricula, organizations, entrance qualifications, qualifications for the teachers, equipment, means of meeting the expenditure, and tuition fees are prescribed by Imperial Ordinances. The establishment of schools

Digitized by Google

by public bodies or private individuals must be approved by the local supervising authorities, which also exercise control to a certain extent over their methods of education and finances.

Religion is, on principle, excluded from the educational agenda of schools. In all schools established by the Government and local public bodies, and in private schools whose curricula are regulated by laws and ordinances, it is forbidden to give religious instruction or to hold religious ceremonies either in or out of the regular curricula.

Education in the colonies comes under the control or the colonial governments, and the military schools belong to the War and the Navy Departments, while there are some technical schools which come under the supervision of other departments. But with these exceptions, it may be safely said that the Minister of Education has charge of all matters relating not only to school education, but also to what may be termed social education, such as art, science, literature and religion. He is assisted by the parliamentary councillor in the conduct of political affairs and in matters which are connected with the business of the Imperial Diet. The vice-minister assists him in the business part of the Department.

Of the affairs within the jurisdiction of the Department, those that are related to education, art, science, and literature are distributed respectively among the Bureaux of Higher Education, General Education, Technical Education, Social Education, School Books, and Student Control, and those pertaining to religion are under the direction of the Bureau of Religion. Those affairs which do not properly belong to any one of these bureaux are dealt with in the Minister's Secretariat. In addition there are school superintendents, who inspect schools and directly supervise educational affairs; supervisors of social education who direct and supervise social educational affairs; superintendents of compilation who compile and examine text-books; and supervisors of school hygiene who look after the sanitary conditions of schools. Various advisory committees with prominent men in and out of office as members are instituted to help the Minister of Education in matters of wider scope.

The Minister of Education is authorized to direct and supervise the Superintendent of the Metropolitan Police and the local governors in matters under his control.

The prefectural governors direct and supervise their subordinate officials and exercise supervision over the public and private schools, kindergartens and libraries within their jurisdictions. There is a Division of Educational Affairs in each prefecture which has control of matters relating to education. School inspectors and sub-inspectors in it inspect schools and conduct educational business directly.

The mayors of cities and towns and the heads of villages deal with affairs regarding elementary schools and exercise control over them. The mayors of cities, moreover, have authority to make recommendations to prefectural governors in the appointment of the principals and teachers of elementary schools. The municipalities have school boards to look after elementary schools.

School Education

As is shown in the following tables, Japan is well provided with schools, ranging from kindergartens up to universities. Almost all the elementary schools are controlled by public bodies.

Conditions are different when we come to secondary education, for which there exist a considerable number of private schools, and in the case of schools of the highest grade the private establishments quite outrange in number those under official control.

Only 18 out of the 45 existing universities were built by the Government, 2 by public bodies and the rest by private bodies.

The total number of schools in Japan proper and their enrolment in the last five years, 1933-1936, is shown below:

Year	Schools	Students
1937	48,215	15,242,333
1936	47,750	14,949,792
1935	46,138	14,035,823
1934	45,903	13,760,200
1933	45,793	13,408,971

Classified according to types, the number of schools in Japan proper on March 1, 1937, with the number of students enrolled, was as follows:

	Schools	Students
Elementary Schools	25,840	11,566,912
Middle Schools	559	352,320
Girls' High Schools	985	432,553
Business Schools	1,301	433,437

Total	48,215	15,242,333
Kindergartens	1,946	152,627

Elementary Education

Elementary education in Japan is compulsory and has attained to its present high level of excellence through many improvements since the promulgation of the School Ordinance in 1872. In the Imperial Ordinance relating to Elementary Schools the object of elementary education is defined as follows :

" Elementary schools are designed to give children the rudiments of moral education specially adapted to make of them good members of the community, together with such general knowledge and skill as are necessary for the practical duties of life, due attention being paid to their bodily development."

According to the system of compulsory education all children from 6 to 14 years of age are called school-age children, and those who exercise parental authority over them, or their legal guardians, must send them either to the ordinary elementary schools established by the cities, towns or villages until they complete the required course of study, or to schools established by the Government, prefectures or by private individuals, recognized as equal to the ordinary ones above mentioned. The law is not enforced when a child is unfit for study owing to physical or mental deficiency or cannot be sent to school by reason of extreme poverty. There is a provision which requires the employers of school-age children to see that the work imposed does not interfere with their going to school.

The responsibility of establishing ordinary elementary schools is placed upon cities, towns and villages, and they are making efforts to maintain schools even in the dire depression of the past few years. At the same time, however, special provisions permit the State Treasury to bear part of the expense, and the diffusion of elementary school education in Japan proper is all but ideal, the number of the school-age children attending schools maintaining the rate of 99.58 per cent for the past five years.

The full figures are as follows :

These figures represent the condition existing on March 31 of the respective years.

Year	School-age Children	Children Attending Schools	Children not Attending Schools	Percentage of Children Attending Schools
1937	11,482,451	11,434,983	47,468	99.59
1936	11,358,094	11,311,266	46,828	99.59
1935	11,150,824	11,103,920	46,904	99.58
1934	11,024,532	10,978,718	45,814	99.58
1933	10,754,962	10,708,930	46,032	99.57

Elementary schools are divided into two grades, namely, ordinary or lower and higher. The former are for the beginners and their course extends over six years. The latter are for those who have completed the lower course, and their courses are of two or three years' duration. The subjects taught are morals, Japanese language, arithmetic, Japanese history, geography, science, drawing, singing, sewing (for girls only) and gymnastics. In the higher courses, either one or more subjects out of handicraft, agriculture, industry, commerce and domestic science (for girls only), are added, and if local circumstances make it advisable, handicraft in ordinary elementary schools and foreign languages and other useful subjects in higher elementary schools may also be taught.

An elementary school may comprise both the ordinary and the higher elementary school courses and may equip itself with a supplementary course of not more than two years.

Under the present system of compulsory education the father's responsibility ends when his child has graduated from the lower elementary school. But

Digitized by Google

the ordinary elementary education of children is not sufficient for the existing conditions of society, and many cities, towns and villages establish higher elementary schools either independently or in connection with ordinary ones.

The following table will give a general idea of the conditions of elementary schools as they were in 1937:

ELEMENTARY SCHOOLS IN 1937

Schools	Governmental	Public	Private	Total
Ordinary	—	6,924	77	7,001
Ordinary and Higher	4	18,622	20	18,646
Higher	—	192	1	193
Total	4	25,738	98	25,840

Higher	96.12	96.52	97.47	96.52
Average	95.86	97.05	96.75	97.05

Teachers There are more male teachers than female in the Japanese elementary schools, and they are classified according to their education and special abilities, as (1) elementary school teachers (2) lower elementary school teachers, (3) teachers on special subjects, (4) assistant teachers, and (5) substitute teachers. The teachers belonging to the first two classes are regular teachers properly qualified for the elementary education of children.

ELEMENTARY SCHOOL TEACHERS CLASSIFIED

(March 1, 1937)

Ordinary Elementary Schools	Male	Female	Total
Regular teachers	121,367	57,634	179,001
Special teachers	3,608	6,969	10,577
Assistant teachers	3,472	1,974	5,446
Substitute teachers	11,290	11,016	22,306
Total	139,737	77,593	217,330
Higher Elementary Schools			
Regular teachers	35,890	3,388	39,278
Special teachers	1,862	1,285	3,147
Assistant teachers	61	9	70
Substitute teachers	1,279	358	1,637
Total	39,092	5,040	44,132
Grand total	178,829	82,633	261,462

Secondary Education

For the secondary grades there are middle schools for boys, girls' high schools, business schools and Young People's schools.

Middle Schools The course of the middle school extends over five years, and its object is to give boys such a higher general education as will fit them to be useful members of society after their graduation. The subjects taught

Digitized by Google

are morals, civics, the Japanese language and Chinese classics, history, both Japanese and foreign, geography, a foreign language (either one of English, German, French or Chinese), mathematics, science, technical studies, drawing, music, practical work (carpentering, gardening, etc) and gymnastics.

From the fourth year upwards, the subjects are selected and arranged into two groups, the pupils making choice between the two. Under special circumstances, however, the Minister of Education may authorize a school in which either of the two groups may be dispensed with. This dual system of curriculum is of benefit on the one hand to the pupils who wish to take up employment immediately upon graduation, and on the other to those who wish to advance to collegiate schools.

To the regular course a supplementary course of one year or less may be added, and, if local circumstances require, a preparatory course of two years may also be provided. A boy who desires to enter a middle school must complete either its preparatory course or the full course of an ordinary elementary school. Those who are twelve or more years of age and in possession of adequate scholastic attainments may be admitted upon examination. Those who have completed the fifth year (the course of the ordinary elementary school ends with the sixth year as mentioned above) of an ordinary elementary school and are physically well developed and have shown excellent scholarship are allowed to apply for the entrance examination, even though under twelve years of age; this is to give a chance to specially gifted boys.

The following are the figures for middle schools and their pupils on March 1 of each year:

Year	Schools	Pupils
1937	559	352,320
1936	557	340,657
1935	555	330,992
1934	554	327,261
1933	558	329,459

A general idea of the condition of the middle schools in 1937 may be obtained by the following table:

MIDDLE SCHOOLS IN 1937

	Governmental	Public	Private	Total
Schools	2	438	119	559

Girls' High Schools The system of high schools for girls is made flexible to suit practical requirements. A girl who has completed elementary school or has equivalent scholastic attainments and is twelve years or more of age may be admitted to a girls' high school. The course of the girls' high school extends over four or five years, and those schools whose entrance requirement is the completion of the higher elementary school or the possession of the same or higher scholastic attainments are allowed to shorten their course to three years. There is another kind of girls' high school which is called Girls' Do-

Digitized by Google

mestic High School, where domestic science is the main course of study, and its regular course extends over two to four years. Girls who wish to take only one part of the course are allowed to do so on application. A supplementary course of two years or less may be provided for the benefit of those who wish to continue their study after completing the regular course, and a post-graduate course or a higher course of two or three years for the purpose of giving higher education. In the cases of the higher course, higher qualifications are required of the teachers and its standard is brought up almost to that of the higher school for boys.

The subjects taught in a girls' high school are the same as those taught in the middle schools, but with the addition of domestic science and sewing, the required hours of study being from 28 to 29 a week. In the case of the Girls' Domestic High School, technical study added and the hours for domestic science and sewing are double those of the ordinary high school, the time allowed for other subjects being shortened, and foreign languages omitted altogether. Under special circumstances the foreign language, drawing and music may be omitted, and if local circumstances require, pedagogics, manual arts, technical studies and other useful subjects may be taught in addition to the normal curriculum. In cases the total weekly hours may be increased to a little over 30. The curriculum of a domestic course of three years, the entrance requirement of which is the completion of the first year of the higher elementary school, is to be suitably drawn up on the basis of that of a domestic course of two years, the entrance requirement of which is the completion of the higher elementary school, and be submitted to the Minister of Education for approval.

The progress of female education is phenomenal in modern Japan and girls, high schools have taken very marked strides in recent years both in number and quality. At the end of March, 1937, there were 985 girls' high schools in Japan proper, many of them being provided with, or contemplating the provision of, a post-graduate course or a higher course.

The number of schools and girl students on March 1 of each year was as follows :

Year	Schools	Girls
1937	985	432,553
1936	974	412,126
1935	970	388,935
1934	975	371,807
1933	963	361,739

Business Schools Business schools of secondary grade are established for the purpose of giving young people the practical knowledge and skill necessary in various vocations, and much is left to the discretion of the founders as to the systems of schools in order to suit the special needs of different industries, trades and localities. The courses may extend from two to five years according to the nature of the school. A period of not longer than one year may be added to the maximum prescribed course. Further provisions are allowed to meet the needs of those who desire to take only a part of the curriculum, for those who, after completing the prescribed course, still desire to remain for further study, and for those who wish after completing the course of a middle school or girls' high school, to enter a business school with the object of receiving business education; and lastly for those who wish to receive instruction in a simple way for only a short period.

On March 1, 1937 there were 1,301 business schools. The figures for the years 1933-37 are given below:

Year	Schools	Pupils
1937	1,301	433,437
1936	1,250	396,968
1935	1,125	367,026
1934	1,041	316,846
1933	1,024	298,893

Business schools are divided into two classes, A and B. Those schools which belong to A class admit boys and girls who have completed the course of the ordinary elementary school, while those which belong to B class admit those who have completed the course of the higher elementary school. And they are of six kinds, namely, Technical, Agricultural, Fisheries, Commercial, Navigation and Practical. Figures relating to these business schools in 1937 are given below.

BUSINESS SCHOOLS (A)

	Schools	Teachers	Pupils	Graduates	Applicants	Admitted	Left School
Technical	110	2,619	43,930	8,612	40,813	12,927	2,198
Agricultural	255	3,015	58,215	16,803	26,899	20,272	2,573
Commercial	325	7,283	187,822	30,950	96,523	48,599	14,039
Navigation	8	125	1,787	474	749	446	70

Young People's School On April 1, 1935, the Young People's School was established by the amalgamation of the Young Men's Training Institute and the Business Continuation School. The attendance became compulsory from April, 1939.

The purpose of the new institution is to elevate young people's attainment as citizens of Japan by training mind and body, by cultivating moral nature and by educating in knowledge and ability indispensable to their profession and practical life.

The course of study of Young People's School is graded into three, common, regular and post graduate. The common course extends over two years, the regular course five years for boys and three years for girls (four years for boys and two years for girls may be allowed according to local conditions), and the post graduate course over one year. Graduates of the lower course of elementary school may enter the common course of Young People's School; those who finished the common course may be advanced to the regular course, while the graduates of the higher course of elementary school have the same privilege; and graduates of the regular course or those who are in possession of an adequate scholastic attainment may take the post graduate course.

Subjects of study are, in the common course, morals, civics, some of subjects common to middle schools, agricultural subjects and gymnastics, with additional studies on housekeeping and sewing for girls only; in the regular course the same subjects are given in a more advanced grade; and in the post graduate course, morals, civics and certain studies selected from the subjects of the regular course. Special course may be added. Pupils are free of charge as a rule.

The number of Young People's Schools and that of their pupils for the years 1933-1937 were as follows:

Year	Schools	Pupils
1937	17,043	1,964,599
1936	16,708	1,902,876
1935	15,306	1,281,814
1934	15,140	1,271,530
1933	15,091	1,270,874

Higher Education

The institutions for higher education are higher schools, universities, colleges, and higher trade and industrial colleges.

Higher normal schools, institutions for training teachers of higher education, post-graduate or supplementary courses in secondary educational institutions and higher grade classes of the special educational institutions are mentioned under other headings, though they might be included here with the other higher educational organs.

The number of schools under this heading, higher normal schools and teachers training institutions and that of students on March 1 of each year follow:

Year	Schools	Students
1937	259	190,332
1936	259	189,151
1935	255	186,963
1934	257	184,473
1933	261	183,792

Higher Schools (Koto Gakko) The higher school is primarily an institution whose object is to complete the general education of young men. But it is as a matter of fact a preparatory school for universities or higher trade and industrial colleges in present-day Japan. No women are admitted. It is divided into two courses, the higher and the lower. The former extends over three and the latter over four years, making seven in all. A post-graduate course of one year may be taken after the higher course. Some schools have the higher course alone. On May 30, 1937, the higher schools with the higher course alone numbered 25, while those with both lower and higher courses numbered 7.

The entrance requirements for the lower course are practically the same as those for the middle schools. The higher course is divided into the literature and science courses and a candidate must be one who has completed the lower course of the same school or one who has completed the fourth year of the middle school or whose scholastic attainments are equal or superior to the same standard.

There are about the same number of preparatory courses of universities which correspond to higher schools and are directly attached to universities. The following figures for 1936-37 refer to the higher schools only.

HIGHER SCHOOLS

(1936-1937)

Schools	32
(Schools which have lower course)	(7)
Teachers	1,269
Lower Course	161
Students	14,656
Lower Course	2,441

Graduates	4,477
Lower Course	573
Applicants	30,538
Lower Course	3,769
Entrants	4,670
Lower Course	601
Left School	396
Lower Course	49

Of the 32 schools, 25 are governmental, 3 public and 4 private.

Universities A university (Daigaku), in its regular form, consists of several faculties, but a single faculty may also constitute a daigaku. Each faculty is required to have a post-graduate course, and in those universities which include several faculties a university hall may be established for keeping the various post-graduate courses in touch with one another. Under special circumstances a preparatory course may be provided.

Admission to a university is extended to the graduates from higher schools and from preparatory courses of its own, and to those who have the same scholastic attainments. When a student has studied in the university for three years or more (four years or more in the faculty of medicine) from the date of his entrance, and has passed a prescribed examination, he may assume the degree of "Gaku-shi" (lit. "learned gentleman") or Bachelor. He is also qualified to enter the post-graduate course. In many universities facilities are provided for those who wish to pursue studies only in some particular subjects according to prescribed regulations.

A university is authorized to confer a doctor's degree on persons who have pursued studies for a period of two years or more in the post-graduate course and whose theses have been approved by the faculty council. Those who have not pursued studies in the post-graduate course may also submit theses and apply for doctor's degrees. The degree is conferred when the faculty council is satisfied with the theses.

The oldest of the 45 universities is Tokyo Imperial University, which was founded in 1877, Kéio-Gijuku and Waséda were founded much earlier, but they were raised to the present standard in 1920 according to the ordinances enacted at that time.

Of the total number of students and pupils, that of regular university students was 51,028 and that of pupils in the preparatory course or elective courses was 21,167.

The following figures as they stood on March 1, 1936 and 1937 show the number of students in these universities classified according to faculties.

Tokyo Imperial University

Organization and Location Tokyo Imperial University (Tokyo Teikoku Daigaku) is a state institution for higher learning and research, and is organized in accordance with the Government's requirements for a university. It is composed of seven Faculties, together with various special institutions. The faculties are those of Law, Medicine, Engineering, Letters, Science, Agriculture, and Economics. The principal institutions attached to the university are the Library, the Institute for Infectious Diseases, the Aeronautical Research Institute, the Tokyo Astronomical Observatory, and the Earthquake Research Institute, which are under the direct control of the President of the University. Besides these institutions, there are the Hospitals, the Marine Biological Station, the Botanic Gardens, the Historiographical Institute, the Forestry Experimental Stations, and the Fishery Laboratory, all under the control of the respective Faculties.

The university proper is situated in Hongo, Tokyo, occupying about one hundred acres of the Kaga Yashiki where are preserved some parts of the ancient gardens. This area comprises the part of the Kaga Yashiki occupied by the university since 1877 and the new addition acquired after the earthquake in the year 1923 from Marquis Maeda, the ancient feudal Lord of Kaga. The name Kaga Yashiki is retained in memory of olden times, and as being dear to many foreign professors of the university who lived in the compound in the early days. The Faculty of Agriculture had been in Komaba, Tokyo, but it was removed to the present site in 1935, grounds of about twenty-five acres adjacent to Kaga Yashiki. Thus all the principal institutions and buildings of the university are now being brought close to one another in

Digitized by Google

the university compound in Hongo. However, the Institute for Infectious Diseases, the Aeronautical Research Institute and the Astronomical Observatory retain their sites at some distance from Hongo.

Special mention should be made of the disaster of September 1, 1923, which affected the whole university to a greater or less degree. A plan of reconstruction is being carried out, good many buildings replacing the destroyed ones have been already completed, among which the new library stands foremost. The new plan having made a remarkable progress, the university ground is already exhibiting an entirely new feature with its buildings and gardens.

Origin and Growth The foundation of the University may be dated in various ways, for its growth had several marked stages in the course of past seventy years. Up to the present the official date of the foundation has been considered to be 1886, when two institutions, the Tokyo Daigaku (Tokyo University) and the Kobu Daigakko (College of Engineering) were amalgamated into the Teikoku Daigaku (Imperial University), the only institution of its kind in the Empire at that time. But the establishment of the Tokyo University in 1877 may be taken as the real founding of the present University, which is in fact a continuation and outgrowth of the former. Again, however, the Tokyo University had its predecessors and was an amalgamation of various institutions of higher learning. The earliest of these institutions can be traced back to 1855, when the Tokugawa Government opened what was called the Yogaku-sho, i. e. the Bureau for Occidental Learning. After some vicissitudes, this institution was discontinued for a short time, owing to the change of régime which supplanted the Tokugawa Shogunate and restored the Imperial Government in 1868. The new government restored the institution in 1869, and extended its scope to that of a college of arts and sciences, with the new name Daigaku Nanko (the Southern College). The appellation "Southern" was meant to designate it as a counterpart of the Daigaku Toko, the Eastern College, which was a medical school with a hospital. This medical school may be said to date from 1861, when a special institute was established for the study of Occidental medicine, though its remoter origin may be traced still further back to the eighteenth. These two colleges, South and East, had, however, no direct connection at the time of the organization of the Daigaku Nanko in 1869. Yet the idea had been to found a large institution of learning comprising all branches of science. After several changes in the status and titles of these two institutions, they were incorporated in 1877 into the Tokyo University under the control of one president, thus realizing the ideal of a university. At this juncture, ground was selected at the present site of the university, where a part of the Medical College was first removed from its "Eastern" location, and was followed by the "Southern" colleges of Law, Science, and Literature.

Since then the development of the university has been marked by the incorporation of other institutions of learning and research; the most important of these was that of the College of Engineering, in 1886, when the new title of "Imperial University" was adopted. In this connection it should be explained that the prefix "Tokyo" was added to "Imperial University," later in 1897, in consequence of the founding of a similar institution in Kyoto, followed by other Imperial Universities in other cities.

The second important step was taken in 1890, in the incorporation of the Tokyo Norin Gakko (School of Agriculture and Forestry) which became the College of Agriculture, one of the six colleges composing the Imperial University. This newly incorporated institution had been started by the Government's Department of Agriculture and Commerce in 1886. From 1890 to 1918, the university was composed of the six colleges of Law, Medicine, Engineering, Literature, Science, and Agriculture; but in 1918, the College of Economics was inaugurated, being a development of a department in the College of Law.

While the nucleus of the university had thus begun in the middle of the nineteenth century under the Tokugawa régime, its backbone formed in 1869 under the new régime, its status secured in 1877, and its new title and an extension of its scope adopted in 1886, its later growth amounted to the incorporation or establishment of several institutes, more or less independent of the educational work of the several colleges (or faculties). The most important of these new additions to the university were the reorganization of the Astronomical Observatory in 1888; the incorporation, in the same year, of the institute which later developed into the present Historiographical Institute; the incorporation of the Institute

Digitized by Google

for Infectious Diseases in 1916; and the founding of the Aeronautical Research Institute in 1918, and of the Earthquake Research Institute in 1925. Besides these, the founding of the Hospitals, the Marine Biological Station, the extension of the Botanic Gardens, and the acquisition of large tracts of forest in various places, have marked steps in the growth of the university.

Faculties The Faculty of Law comprises the 2 departments of law and political science, with 34 professorial chairs. The Faculty of Medicine includes the 2 departments of medicine and pharmacy, with 35 professorial chairs. The Faculty of Engineering comprises the 10 departments of civil engineering, mechanical engineering, naval architecture, aeronautics, technology of ordnance, electical engineering, architecture, applied chemistry, technology of explosives and mining engineering and metallurgy, with 58 professorial chairs. The Faculty of Literature comprises the 19 departments of Japanese language and literature, Japanese history, Chinese philosophy, Chinese language and literature, Oriental history, Occidental history, philosophy and history of philosophy, Indian philosophy, Sanskrit language and literature, psychology, ethics, science of religion and history of religion, sociology, pedagogics, esthetics and history of fine arts, science of language, English language and literature, German language and literature, and French language and literature, with 41 professorial chairs. The Faculty of Science comprises the 10 departments of mathematics, astronomy, phisics, chemistry, zoology, botany, geology, mineralogy, geography, and seismology, with 41 professorial chairs. The Faculty of Agriculture comprises the 7 departments of agriculture, agricultural chemistry, forestry, veterinary medicine, fishery, agricultural economy and agricultural engineering, with 42 professorial chairs. The Faculty of Economics comprises the 2 departments of political economy and commerce, with 17 professorial chairs.

Those of adequate learning, aged 19, or above, who are desirous of attending the lectures or experiments for one or more subjects prescribed in the faculty departments, may be admitted as elective pupils in the Faculties, but only when there are vacant seats.

Auditors may be admitted to the faculties on application, when the study of the students is not inconvenienced by their presence. They must conform with the conditions prescribed by the faculties, unless they are entrusted by the Japanese or foreign governments. In addition, there are practical courses of agriculture, forestry, and veterinary medicine in connection with the Faculty of Agriculture. Applicants for admission must be graduates from middle schools, or those who are recognized as having equal attainments.

Students who remain in one department for more than 6 years (in the department of medicine, 8) are struck off the school roll. The practical courses in the Faculty of Agriculture run for 3 years.

The period for scientific research by students in the University Hall is fixed at 2 years. If their research necessitates the prolongation of this period, the President may permit it, on their application, to the extent of 5 years. They are under the control of the dean of the faculty whose curriculum they follow. As to their teacher or teachers, the faculty concerned decides.

In March, 1936 the number of professors was 655 and that of students 8,091.

Tuition is ¥120 a year for under graduates and ¥75 for post graduates.

Annual salary of the professors is from ¥1,130, to ¥4,050 besides th stipend attached to a chair from ¥500 to ¥1,600.

The Budget The budget for the fiscal year 1939-40 is as follows:

REVENUE

Ordinary	
From the Government	¥4,053,240
Miscellaneous income	5,658,107
Total	9,711,347
Extraordinary	
From the Government	1,022,646
From the Endowment Fund	798,055
Contributions	30,000
Total	1,850,701
Total revenue	11,562,048

EXPENDITURE

Ordinary	
Salary	¥2,296,122
School disbursements	6,923,443
Salary of foreign professors	14,850
Pension allotment	462,329
Miscellaneous	14,603
Total	9,711,347
Extraordinary	
Total	1,850,701
Total expenditure	11,562,048

University Library The University Library takes charge of books, manu-

Digitized by Google

scripts, charts, etc. in the possession of the university including those in the general library and departmental libraries. Before the great disaster of September 1, 1923, the general library contained about 700,000 volumes, most of which were reduced to ashes. Some of the departmental libraries met the same fate. The great loss aroused universal sympathies both at home and abroad. Marquis Tokugawa offered the university the whole of the Nanki Library with its collection of about 100,000 volumes, mostly Japanese and Chinese books. The work of the British Committee for collecting English books was completed by April 1934, and the books thus given amounted nearly to 56,000 volumes. As a climax of the British gifts the library received a very select collection of books illustrative of the history of English printing and book production, including the Kelmscott Chaucer.

On the other hand, when the building to store the books thus accumulated was still unavailable, a wireless message, dated the last day of 1924, came from Mr. John D. Rockefeller, Jr., of New York, generously offering a fund of four million yen for the reconstruction of the library. He entrusted the fund to a committee of Three, consisting of the President of the University, the Director of the Library and the late Dr. Dan, for the execution of the building construction, library equipments, and purchase of books. Besides two committees were organized for the Building plan and the Restocking of Books, consisting of professors of the several faculties, and they cooperated in reconstructing the library. The plan for the library was decided upon in 1925 and the work of building completed by the end of November of 1928, and the dedication took place on December 1st of the same year. With the remainder of the Rockefeller Fund, works of modification and amendment were effected, including the installation, over the portico of the façade, of the bronze medalions which symbolize eight features of human life: Power, Order, Integrity, Truth, Vitality, Charity, Solidarity, and Mystery.

The Reconstruction Album of the Library was published in 1930 and sent to principal donors all over the world as a token of gratitude for their sympathy and assistance for the reconstruction of the library.

It is now almost nine years since the new building was opened, and the work of arranging the so-called Rehabilitation books was completed by the end of 1935.

During the fiscal year of 1936 there were added 36,201 volumes of books both by purchase and donation:— Oriental books, 13,071 volumes. Occidental books, 23,130 volumes.

By the end of March 1937 the sum total of books so far registered at the library reaches 1,051,485 volumes.

Thus the University Library, with its magnificent building and modern equipments together with its enriched contents, is enabled to give considerable comfort and convenience to her scholars with full capacity and is rendering manifold services as a centre of intellectual activities of the university. Besides the library is affording due facilities to scholars in research works and other visitors from foreign countries.

Doctor's Degrees

The following is a summary of doctor's degrees awarded during past 4 years.

Name	Awarded in 1933-34	Awarded in 1934-35	Awarded in 1935-36	Awarded in 1936-37

Colleges, and Higher Trade and Industrial Colleges "College" is the usual translation of the Japanese "Semmon Gakko" or Speciality School. The required length of the course of a college is three years or more. For admission to an art or music school, the completion of the third year of the middle school or the girls' high school or the possession of equal or higher scholastic attainments is required, while for admission to all other colleges the completion of the course of the said second grade schools or similar or higher scholastic attainments is required.

In March, 1937, there were 118 colleges, 8 of them being founded and maintained by the Government, 9 by public bodies and the rest by private bodies. They may be classified as follows according to their nature:

Pharmacy	8
„ for women	5
Medical Science	5
„ „ for women	3
Dentistry	5
„ for women	2
Medical and pharmacy, for women	1
Languages	3
Literature	6

Other Education

Besides the schools stated above, there are Kindergartens, schools for the blind, schools for the deaf and dumb, and miscellaneous schools.

Kindergartens Kindergartens are found chiefly in larger towns. With general social progress, however, the necessity of their improvement and diffusion being greatly felt in spite of the recent financial depression, an Imperial Ordinance for Kindergartens has lately been issued to encourage their further development. Kindergartens receive children from 3 years of age to school age or full six years of age.

The following table gives the number of kindergartens and that of children attending in the years 1933-37:

Year	Kindergartens	Children
1937	1,946	152,627
1936	1,892	143,676
1935	1,862	143,469
1934	1,736	133,735
1933	1,708	129,001

Education for the Blind and the Dumb It has been the educational policy of the Japanese Government since the beginning of the Meiji Era that there shall be no illitrates in the country. Therefore, even persons with physical defects are admitted to elementary, middle or girls' high schools, provided that they are fit to attend a greater part of the lessons. But boys and girls who are blind or deaf and dumb are encouraged to enter schools specially founded for them. A special ordinance relating to the schools for the blind and schools for the deaf and dumb has lately been issued for the purpose of perfecting their elementary and secondary education. The following table gives the number of them and that of their pupils in the years 1933-1937.

Year	Schools	Pupils	Blind	Deaf & Dumb
1937	140	10,566	5,040	5,526
1936	140	10,284	4,950	5,334
1935	140	9,907	4,830	5,077
1934	138	9,500	4,709	4,791
1933	127	8,939	4,613	4,326

Miscellaneous Schools Under the heading of "Miscellaneous Schools," the Japanese Government includes for convenience' sake all schools which do not fully come into any definite category of schools under the provisions in the laws and ordinances.

The following table gives the number of miscellaneous schools and that of their pupils in the years 1933-1937.

Year	Schools	Pupils
1937	1,935	259,621
1936	1,912	240,800
1935	1,921	230,394
1934	1,950	209,674
1933	1,917	203,123

Of the total given above, 143 were maintained by public bodies and 1,787 by private persons or bodies. As to their category those which might be classified as elementary schools numbered 202, middle schools 111, girls' high schools 74, business schools 648, colleges 31, the blind and the dumb schools 9, and the professional 860. Among miscellaneous schools, there are not a few which to be highly esteemed as educational institutions in their ideas and new methods of education. Many of the Christian schools are included among them.

New Educational Movements The educational system of Japan is so complete, as is specially the case with primary school education, that there has been hardly any room for such free educational movements as in Europe and America. The progress in other lines of national life, however, naturally stimulated the awakening of scholars and practical educators towards the end of the Meiji Era. The development of major cities presented a large field for the experiment of new educational work. Influenced by Western thoughts and guided by scholars who gave expositions on European and American educational thoughts so as to adapt the characteristic environments in Japan, many new schools have been established in Tokyo and Osaka. Their scope of influence as well as their number is limited, and the new movement, which is more or less radical, is going

Digitized by Google

through difficult times owing to the reactionary tendency in these years: but the existence of such schools as Mrs. Masako Yosano's Bunka-gakuin, Mrs. Motoko Hani's Jiyu-gakuen, and Mr. Kuniyoshi Obara's Seijo-gakuen proves the demand for and appreciation of new education among the more advanced quarters of urban population. The new educational movement among elementary school teachers must not be overlooked. Their curriculum cannot deviate very much from that fixed by the government, but their efforts for handling materials so as to adapt the local environment of the pupils and to take in the projective method are bringing about good results. The representative schools are Tajima Elementary School in Kawasaki, Urashima Elementary School in Yokohama, etc. Elementary schools of a similar kind may be found in many places throughout the country.

Training of Teachers

The Japanese Government, alive to the necessity of having a large supply of capable teachers, has spared no efforts in the completion of organs for their training. To give an outline of the present system, Hokkaido and the prefectures are called upon to establish and maintain at least one normal school each, and an institution for the training of Young People's School teachers when circumstances make it necessary, a responsibility which is also imposed on the cities. The Government itself undertakes the training of teachers of normal schools, middle schools, girls' high schools and technical schools by establishing and maintaining higher normal schools, higher normal schools for women, special institutes for the training of teachers, etc., and the students of these schools are given scholarships, covering part of their expenses, either by the Government or by the local public bodies. Moreover such of the students of universities, colleges and the like as intend to become teachers, receive aid out of public funds or may be exempted from the payment of fees. Persons who have proved themselves deserving extended aid are chosen for studying abroad in order that they may be better qualified to teach higher arts and sciences.

The following table gives the number of schools for training teachers and that of their students in the years 1933-1937:

Year	Schools[1]	Students
1937	157	34,663
1936	156	34,019
1935	156	34,583
1934	155	36,849
1933	157	41,060

Organs for Training Elementary School Teachers The principal organs for training elementary school teachers are the normal schools, while the training course B grade of the Tokyo Academy of Music trains music teachers for elementary schools.

A normal school consists of the regular and the post-graduate courses, the former is divided into the first and second sections. The course of study of the first section extends over five years and it takes in the graduates of higher elementary schools of a two years' course or persons of over 14 years of age who have similar attainments. The course of study of the second section runs for two years and it takes in graduates of middle schools, girls' high schools and persons of similar scholastic attainments.

The following table gives the number of normal schools and that of their students and graduates in the years 1933-1937:

Year	Schools	Students	Graduates
1937	101	30,256	10,340
1936	102	29,825	10,431
1935	102	30,420	10,735
1934	103	32,817	11,669
1933	103	36,867	12,611

Organs for Training Teachers for Secondary Education As organs for training the teachers of secondary education, there are the higher normal schools, higher nomal schools for women, special institutes for training teachers, the training course in drawing of the Tokyo Academy of Fine Arts and the training course, grade A of the Tokyo Academy of Music. The systems differ more or less with the schools or the main subjects taught, but their entrance requirements are, generally speaking, the completion of middle school, girls' high school and normal school, or the possession of the same or higher scholastic attainments, and their courses extend over four, three

1 Note: There are 4 colleges and their students included in this as well as in the number of the table on colleges.

Digitized by Google

or two years, with additional post-graduate and special investigation courses. The number of graduates from these schools is from 850 to 1,000 annually.

In addition to the foregoing, teachers' certificates are issued without examination to graduates of high grade schools both in Japan and in other countries in order to meet the deficiency in the supply of secondary school teachers. The main conditions are that the schools in question must be equal to or higher than the higher normal schools of Japan in entrance requirements and in curricula. Including those who passed examination there were 11,014 persons 8,025 men and 2,989 women who received such certificates in 1936-1937.

Organs for Training Business School Teachers For the purpose of training teachers of practical subjects in technical schools, institutes are attached to the Government universities and colleges. They are of a three year course, the scholastic standard corresponding to that of the colleges.

The following table gives the number of such institutes and that of their students and graduates in the years 1933-1937:

Year	Agricultural		Technical		Commercial		Total		
	Schools	Students	Schools	Students	Schools	Students	Schools	Students	Graduates
1937	1	84	2	224	1	56	4	364	119
1936	1	120	2	142	1	98	4	360	114
1935	1	116	2	144	1	96	4	356	111
1934	1	111	2	150	1	101	4	362	120
1933	1	116	2	150	1	105	4	271	113

As further means of providing business school teachers, certificates are issued without examination to graduates of certain specified schools. Including those who passed examination the number of persons who received such certificates in 1936-1937 was 444.

Organs for Training Teachers of Young People's Schools For this purpose there are institutes which Hokkaido, the prefectures and cities alone are authorized to establish. They are of one or two year courses above the secondary education. The following table shows the number of these institutes and that of their students in 1933-1937:

Year	Institutes	Students	Graduates
1937	47	1,315	539
1936	45	1,117	619
1935	45	1,106	588
1934	43	1,014	529
1933	42	1,039	618

Training of High-grade Professors No particular schools are instituted for the training of high-grade teachers. Scholarships, however, are given to students of the post-graduate course of higher normal schools for training such professors. Further, persons of adequate career and experience are sent to foreign countries for a further prosecution of studies, their expenses being met by the Government. The following are figures concerning such persons at the end of March, each year:

Year	Students Abroad	Year	Students Abroad
1937	168	1934	136
1936	126	1933	184
1935	104	1932	191

As a further means of supplying higher grade professors, a professor's licence is granted to persons holding doctor's degrees and those who have graduated from universities and colleges. In 1936-1937 the number of persons who received Higher School Professor's licences was 1,097, of which 9 were women.

Training of Special School Teachers and Nurses of Kindergartens Teachers for the blind and the deaf and dumb are trained in the training courses in the Tokyo School for the Blind and the Tokyo School for the Deaf and Dumb. The nurses of kindergartens are trained in the training courses provided in women's normal school, special courses in the higher normal schools for women and in the special institutions for the purpose established by private bodies. In 1936-1937 the number of kindergarten nurses' certificates given was 1,164.

Teacher's Certificate Given by Examination Persons who have similar scholastic attainments with the graduates of the schools mentioned above, may ask for an examination to get a teacher's licence. They have to undergo a strict examination by the special examination committees of the Educational Department. The number of per-

Digitized by Google

sons who passed such examination during 1936-1937 was 7,313. These may be classified as follows :

Teachers of	Applicants	Passed examinations
Elementary School and Kindergarten	41,492	6,613
Normal School, Middle School and Girls' School	6,528	577
Higher Department of Higher School	71	10
Business School	887	113

Physical Education and School Hygiene

With a view to promoting the rational development of the young and to encourage and further the spread of gymnastics, games and athletic sports, both eastern and western, there was established in 1924 a national Institute for Research in Physical Training, where research work is now in active progress.

For school hygiene, special attention is paid to buildings and equipments, and efforts are being made to improve and strengthen the physical constitution of pupils and students by employing school physicians, dentists and nurses, by taking measures for the prevention of infectious diseases in schools, by making plans for open-air schools, vacation colonies, school feeding, school clinics and the like.

There were 33,003 school physicians, 8,429 dentists, and 3,208 nurses for 33,003 schools in 1937.

For the administrative organs responsible for the work referred to, Hokkaido and prefectures have school hygienic experts and directors of physical training, while the Department of Education has the Section of Phsyical Training, Supervisors of School Hygiene and the Institute for Research in Physical Training. In addition, there are provided in the Educational Department a School Hygiene Investigation Committee and a Physical Training Investigation Council, which investigate and make researches in important questions submitted to them by the Minister of Education.

Social Education

For the diffusion and development of social education there has been created a Bureau of Social Education in the Department of Education, and a certain number of supervisors of social education are appointed in the Department, and directors of the same in the local governments.

Adult Education For the benefit of those adults who have had little or no chance to receive regular education, the Department has requested some of the schools under its direct control or under that of the local governments to start a series of lectures. Most of the adults who are gathered to these lectures are labourers or farmers, and fuller reference to this is made in the chapter on labour.

Libraries The spread of libraries in Japan has been rather slow because of many reasons, but the place of the library in social education has been understood more and more clearly with the advancement of national and international life in recent years. The Government, therefore, established a national library at Uéno, Tokyo, and at the same time has given encouragement to local public bodies for establishing their own libraries by granting subsidies to them. It also tries to help them by holding short period courses for training capable librarians. The results of these efforts have been a notable progress in libraries, as may be observed in the following table :

Year	Public Libraries	Books	Readers	Daily Average of Readers of a Library
1937	4,730	12,648,000	24,124,000	20
1936	4,759	12,319,000	24,191,000	20
1935	4,794	11,376,000	24,666,000	20
1934	4,634	10,762,000	24,949,000	21
1933	4,686	10,563,000	24,766,000	20

In November, 1931, the Tokyo Science Museum was established by the Government. It is located in Uéno Park, Tokyo and exhibits 1,889 technical and machine models and 196,779 specimens of natural science. In 1936-37, 271,296 people visited it in 356 days.

Young Men's and Young Women's Associations With the object of giving mental and moral culture to those young men and women who are no longer cared for in the schools, the organization of young men's and young women's associations has been encouraged so that there is at present hardly any city, town, or village where they are not established. These associations work, on the whole, according to the principle of self-government, quite different from the foregoing Young People's Schools, and along the lines which they choose in view of the circumstances peculiar to themselves.

The following table shows the number of young men's and young women's associations and that of their members in the years 1932–1936 :

Year	Y.M.A.	Members	Y.W.A.	Members
1936	15,719	2,450,427	13,909	1,528,071
1935	15,469	2,456,505	13,537	1,507,778
1934	15,440	2,488,113	13,468	1,512,682
1933	15,300	2,497,166	13,378	1,522,041
1932	15,365	2,518,173	13,394	1,534,125

Boy Scouts and Girl Guides The boy scout movement, which is also an important item in the social education of the young, has made much progress since the organization of the Japan Federation of Boy Scouts in 1922. The President of the Federation was the late Count Shimpei Goto, and its head office was located in the Department of Education building. The boy scouts which are affiliated with the Federation are scattered all over the Empire except 4 prefectures in Japan proper and the South Sea Mandated Islands. In 1925, the Marine Branch was established and it owns a training-ship.

The number of boy scout organizations and that of the members were approximately 1,100 and 90,000 respectively in March, 1935. The Federation is led by Count Yoshinori Futara at present.

The girl guide movement was first introduced into Japan in 1920. The earliest organizations appeared in Tokyo and Morioka, and the movement gradually spread over different parts of the country, although it has not yet achieved such progress as the boy scout movement, having only 27 guides with about 300 girls in 1931.

Educational Expenditure

Education in Japan, as previously mentioned, is principally controlled by the State, though it is partly delegated to local public bodies and partly carried on by private individuals or organizations by permission of the Government. The expenditure incurred is met from these three different financial sources.

Part of the educational expenses of local public bodies, however, is met by the State Treasury in order that the teachers may be sufficiently paid and the burdens on the ratepayers may not be too heavy. Formerly the sum of ¥10,000,000 was yearly defrayed for this purpose, but it has been recently increased to ¥85,000,000 or more, and destitute municipalities receive special consideration in the apportionment of the grant.

Local governments are required to pay additional salaries at certain rates for long service to the teachers of schools for which they are directly responsible. To meet part of these expenses, the Government allocates a sum of money fixed annually in the National Budget and divides it among Hokkaido and prefectures in proportion to the number of teachers. In cases where a city, town or a village undertakes to pay for residences of elementary school teachers, the higher local body is required to share part of the expense.

In recent years educational undertakings have been greatly extended and the treatment of teachers considerably improved in accordance with the post-war programme of the country, and this has caused the educational expenditure to swell in a remarkable degree. The following table shows the total governmental and public educational expenditure in yen during the years 1932-1937:

Year	State Treasury	Prefectures	Cities	Towns and Villages	School Associations	Total
1937	142,573,799	111,717,579	137,128,239	230,811,039	122,442	622,353,098
1936	151,099,914	109,120,439	119,144,631	224,908,617	102,928	604,376,529
1935	154,732,262	104,617,681	103,435,462	214,853,579	91,476	577,730,460
1934	152,105,765	100,103,429	102,318,577	202,816,370	87,274	557,434,115
1933	148,083,243	97,885,783	87,580,024	199,345,796	89,838	532,984,684
1932	137,239,255	106,856,178	77,676,969	197,723,655	87,829	519,583,886

The above table does not include the amounts expended on local educational administration.

In order to show the total expenditure, both governmental and local, the year 1934–1935 is taken and full details of the items of expenditure are shown :

Total	71,496,348	68,245,697

Other Schools

There are schools in Japan proper which do not come under the control of the Educational Department, and they have been excluded from the foregoing sections. But to complete the chapter on education we cannot pass without some mention of them. Fuller explanations may also be found in other chapters.

Peers' Schools They belong to the Department of the Imperial Household, and the purpose of their establishment is the education of the nobility, but admission to them is by no means restricted to children of titled families. They are called the Gakushu-in and Joshi (women) Gakushu-in. The former is for boys and is composed of three departments, namely, elementary, middle school, and college. The latter is composed of two departments, namely, high school and college.

Two Special Schools The Department of Foreign Affairs has two schools;

Digitized by Google

one is the To-a Dobun Sho-in (Tung Wen College) in Shanghai and the other the Russo-Japanese Association School at Harbin.

The Jingu-Kogakkan This was established by the Home Department and is a Shinto seminary.

The Fisheries Institute This is under the Department of Agriculture and Forestry.

In the territories, schools are under the control of the Territorial Governments, as a matter of course, and full descriptions of them may be found in the chapters on territories. However, a list of the various universities and colleges is here appended.

CHOSEN
- Kéijo (Seoul) Imperial University
- Kéijo Imperial University Preparatory School
- Kéijo Law College
- Kéijo Medical College
- Kéijo Technical College
- Suigen Agricultural and Forestry College
- Kéijo Commercial College
- Eight private colleges

TAIWAN
- Taihoku Imperial University
- Taihoku College
- Four other colleges

KWANTUNG
- Ryojun (Port Arthur) Technical University
- Preparatory College for the same
- Four private colleges

Foreign Teachers and Students

The number of foreign teachers and students at the end of March, 1937, was as follows:

Schools	Teachers			Pupils & Students		
	Male	Female	Total	Male	Female	Total
Elementary	—	7	7	324	188	512
Normal	—	—	—	4	—	4
Higher Normal	6	—	6	128	—	128
Woman's Higher Normal	—	—	—	—	25	25
Middle Schools	35	3	38	45	—	45
Girls' High Schools	2	65	67	—	6	6
Higher Schools	69	1	70	114	—	114
Universities	98	2	100	1,523	76	1,599
Colleges	135	70	205	1,456	259	1,715
Business Colleges	68	—	68	276	4	280
Business Schools	29	13	42	14	—	14
Young People's Schools	—	2	2	—	—	—
Blind Schools	—	1	1	—	—	—

CHAPTER XXIX

RELIGION

General Survey

From prehistoric ages Japan has had an indigenous cult which is now known as Shinto. Buddhism and Confucianism were introduced through Korea and China later, and Christianity more recently still. Islam, however, never gained a footing on her soil, though its literature has been introduced to some slight extent.

Shintoism has had little to do with the thought and life of the people, apart from its relations with the functions of the guardian deities, national and local, and bears some resemblance to the primitive cults of Greece and Italy. It is now divided into two, namely, national Shintoism, which is represented by the shrines, and sectarian Shintoism, which developed towards the end of the Tokugawa Shogunate.

Confucianism is rather a code of moral precepts than a religion, except in that it teaches some vague ideas regarding a heavenly God. In the realm of moral culture it has exerted great influence on the minds of the Japanese people and on their principles of daily life; that influence being very noticeable in the Imperial Rescript on Education of the Emperor Meiji. Further mention of Confucianism will be omitted here because it can hardly be regarded as a religious cult.

Buddhism has had still greater influence on all phases of Japanese life. Its fatalism has had a retarding effect on the material progress of the Japanese as with other Oriental nations, but has induced a habit of dauntless composure in their behaviour, and its broad philanthropy has given rise to a spirit of mutual help among the people, subduing egoism or individualism. Its philosophical literature fed the national thought, while its fine art has left many masterpieces enriching the cultural life of the Japanese. Buddhism is still the most powerful among the religions in Japan.

Christianity has made valuable contribution toward the civilization of Japan with its world-wide nature and positive teachings on human life. The number of believers is comparatively small, but its influence on the people's thought and morals is said to be even greater than that of Buddhism. It has raised Japan's moral standards, waging war against licensed prostitution, the low position of women, drinking and smoking, and polygamy as practised in a certain section of society. It has still to amalgamate itself with the life of the people in order to exert greater influence upon them, but its future is hopeful.

Shinto Shrines

While the sectarian Shinto denominations are under the Education Department as other religious bodies, most Shinto shrines are supervised by the Shrine Bureau of the Home Department, which consists of one chief official and 64 minor officials. The budget of the Bureau for the fiscal year 1939-40 is as follows:

Running expenses	(In yen)
Isé Great Shrine	230,000
Other national shrines	1,021,720
Ordinary expenses	1,000,000
Ceremonies and rituals	7,465
Soldiers' shrines	14,255
Total	1,251,720
Incidental expenses	
Office of Isé Great Shrine	69,004
Investigations	13,963
Reconstructions	1,110,000
Education of priests	36,500
Total	1,229,467
Sum total	2,481,187

The Isé Great Shrine is the most honoured of all as the first national shrine. The Goddess enshrined in it is Amaterasu-Omikami, which may be translated as Heaven-Shining-Great-Goddess. According to the Japanese mythology, Amaterasu-Omikami sent down her grandson to the Nippon Islands to rule the people by the 'Kingly Way,' giving him the Three Sacred Treasures, which have been handed down even to the present Emperor as the sacred symbols of the Imperial Throne (see Appendix, The Constitution of Japan; The Imperial Household Law Article X; and Chapter III). In the Great Shrine and appendant shrines more than 10 gods, who represent the Imperial ancestors or personify natural powers, are installed beside the

Digitized by Google

principal Goddess.

The name of the shrine comes from its location in Isé province or more accurately on the Isuzu river, city of Ujiyamada, Mié prefecture. The whole sacred area of the Great Shrine includes 13,135 acres.

About 74 priests are attending it under a chief priest. There are established a seminary for the education of priests, a police station, two museums, and a library in connection with the shrine.

The budget for the fiscal year 1939-40 is ¥299,004.

According to the report of the Shrine Bureau, the Home Department, the number of other shrines at the end of 1936 was as follows:

Governmental and national shrines	203
Prefectural and village shrines	49,542
Private shrines	60,836
Soldiers' shrines	104

The number of private shrines in Japan proper has been steadily decreasing since 1889, lessening from 136,783 in that year to 60,836 in 1936. There were many too superstitious and barbarous ones among them and the decrease indicates the healthy progress of the religious ideas of the people and the radical policy of the government.

The total area of the sacred campus of these shrines in 1933 (not including soldiers' shrines) covered 76,948,646 tsubo, 65,721,332 of it being government property.

The total number of priests in Japan proper at the end of the year 1936 was 15,955.

For the education of priests there are one seminary of college grade at Isé as mentioned above, a department in Kokugakuin (Japanese literature) College of junior college grade, a middle school grade seminary affixed to the one at Isé, and 26 smaller places for giving a course of study, the total number of students being not more than 2,100. It may be said, therefore, that the education of Shinto priests is on a much lower scale than that of Buddhist priests or Christian pastors.

Sectarian Shintoism

Shinto Sect This sect is called by the general name given to the national cult before its later branches had developed. The principal ideas of the sect are to follow the "Great Way of the Gods," and to propagate the national cult indigenous to the people of this country. Its believers and devotees consider it their most important duty to cultivate reverence for the gods, cherish the spirit of patriotism, elucidate Heavenly Reason and Humanity, pay homage to the Emperor, and observe all the Imperial ordinances.

Kurozumi Sect This was founded by Munetada Kurozumi (1780–1850), who was born at a small village of Okayama prefecture. His main idea was to inhale, while contemplating the Goddess Amaterasu-Omikami, the energy of the sun, and thereby to fill up the heart with satisfaction and complaisance. He teaches to avoid the following seven evils, which are against the will of the gods: (1) to be faithless to the country of the gods in which one was born; (2) to get angry and to worry over things; (3) to be arrogant and spiteful; (4) to entertain evil desires from seeing others do evil; (5) to neglect one's household affairs while in good health; (6) not to have sincerity even when one is entering upon the path of sincerity; and (7) not to accept things gratefully for which one ought to be grateful every day.

Other sects of Shinto are as follows—the teachings of all being much the same, except that some lay particular stress on the worship of one or another of the early gods:—

Shinto-shusei	Found by Kunimitsu Nitta (1829–1902) born in Chiba Prefecture.
Taisha	Preached by Sompuku Sengé (1845–1918)
Fuso	Founded by Takekuni Fujiwara (1541–1646) and preached by Han Shishino.
Taisei	Founded by Shosai Hirayama (1815–1890)
Jikko	Founded by Hanamori Shibata (1809–1890)
Shinshu	Founded by Masamochi Yoshimura (1839–1916) Okayama prefecture.
Ontaké	The chief centre of this sect is Mount Ontaké, where the spirits of certain gods are enshrined.
Misogi	The sect of Water Purification. Founded by Masakané Inouyé (1790–1849) of Mié prefecture.
Shinri	Founded by Tsunehika Sano (1834–1906)
Konko	Founded by a farmer, Bunjiro Kawaté (1814–1883)
Tenri	Founded by a woman, Miki Nakayama (1798–1887) of Nara pre-

Digitized by Google

Tenri

fecture. Of all these sects the Tenri-kyo has perhaps the greatest number of believers; it lays emphasis on personal conduct and mental discipline, in addition to patriotism and obedience to the Emperor and Imperial ordinances. It particularizes the "eight forms of dust which must be swept away"; they are grudging, evil desires, impure attachments, hatred, enmity, anger, covetousness and arrogance.

Buddhism

It was in the thirteenth year of the Emperor Kimmei (552 A.D.) that Buddhism, first founded in India, came over to Japan after passing through China and Korea. Prince Shotoku, Regent from 593 to 628 A.D. and a devout Buddhist, was largely responsible for its rapid spread throughout the country. Six schools of Buddhism, that is, Sanron, Hosso, Jojitsu, Kusha, Ritsu, and Kegon, were introduced one after another. In the reign of the Emperor Kwammu (782–805 A.D.), Tendai and Shingon flourished. New schools such as Jodo, Zen, Shin, Nichiren and others then gradually developed. Through these long periods of its history Buddhism became further divided, owing to differences in the exposition of the doctrines and in the methods of propagation, into many sub-sects. Eleven of the principal sects still in existence are Hosso, Kegon, Ritsu, Tendai, Shingon, Yuzunembutsu, Jodo, Shin, Ji, Zen, and Nichiren; and these eleven are sub-divided into fifty-eight branches. The principal teachings of the eleven Buddhist sects are as follows:

Hosso Sect This sect was introduced into Japan by Dosho (628–700), a Buddhist priest who went to China in 653 and studied its teachings under Hsuantsang. The main teachings of Hosso are that all sentient beings find Salvation in accordance with the difference in character and endowments, of which five yanas are to be distinguished, that the doctrinal system of this sect and its scriptural texts are in full correspondence with the truth, that as all things are merely manifestations of pure consciousness, there are no real ego-souls and no real objects, and that the great fruit of Bodhi and Nirvana is attainable in and through the reality of the Middle Path, which is a peculiar combination of realism and idealism.

Kegon Sect Roben (688–776) of Todaiji Temple, Nara, the first propagator of this sect in Japan, learned its doctrines from the Chinese Buddhist priest Dokei who visited Japan during the Tempyo Era (729–749). The teachings of this sect are based upon the Kegon Sutra, which says that the ultimate reason of Suchness is absolute and infinite; the Ultimate and the Manifested are mutually related and intimately intertwined; each Manifestation too is so thoroughly and interminglingly related to another Manifestation that between the two there is no wall of individual separation. The teachings of the sect are, therefore, called the Perfect Doctrine. Those who, in accordance with the doctrine, understand the mystery of the mute evolution of the spiritual cosmos, and who practise goodness and are guarded in their conduct, are sure to attain Buddhahood and to realize the Ultimate Reason. The head-temple of this Sect is Todaiji in the city of Nara.

The term "Shinnyo", or tathatva, which we have translated "Suchness" in the foregoing, is a very comprehensive word, signifying "truth", "reality," or "the first principle of emptiness". The first character, "Shin" means "that which is true without any admixture of error". The second "Nyo", is the same as is usually translated "like". The two taken together have come to mean "the Absolute Itself". There are three main interpretations of it. The doctrine of the Kegon Sect, as one of these interpretations, identifies the absolute and the relative, the noumenal and the phenomenal, asserting that each separate phenemenon, being endowed with the qualities of the Absolute, has unlimited power to produce other phenomena. The doctrine derived from the Kegon Sutra teaches that even a single particle of dust has the manifold, infinite and absolute virtues of all things in the universe, and that so, if a man observes a certain practice, he is at the same time doing all other religious practices.

Ritsu Sect The Ritsu or the Sect of Moral Discipline ("Vinaya" in Sanskrit) was first propagated in Japan by Ganjin (686–763), a Chinese Buddhist priest, who came to Japan during the Tempyo Era (729–749). It obtains its name from the Vinaya-pitaka, according to which its followers strictly regulate their daily conduct. It teaches to observe, as ordered by Buddha, all the precepts ("sila" in Sanskrit) such as the Five Precepts, the Eight Precepts, the Six

Digitized by Google

Novitiate Precepts, the Ten Precepts, or the Two Hundred and Fifty Precepts. Toshodaiji in Nara prefecture is the head-temple of this Sect.

Tendai Sect The founder of this sect was Chisha Daishi (537–597) of the Sui Dynasty.

The Japanese priest Saicho (Denkyo Daishi, 766–822) went over to China in the year 782 during the Yenryaku Era, and studied the principles of Tendai there. On his return to Japan, he became the chief exponent of the sect in this country. The teachings of the Tendai Sect are comprised in two divisions, metaphysics and meditation. It critically systematizes in its metaphysical part all the teachings of Sakyamuni, drawing a clear line between what is mere expedient and what really represents the spirit of the founder of Buddhism. As the result Tendai has come to consider Saddharma-pundarika Sutra (the Lotus of the Good Law) the doctrine of Sakyamuni, in which the reason of his appearance on earth is truthfully explained. The meditation part consists in applying our minds to all that is taught in the Sutra and realizing it in our daily practical life. Ten grades are distinguished in the practice of meditation, while its main object is to put a stop to disturbing thoughts and to get enlightened on the principles of the four classes of Buddhist doctrines. The ultimate end of all this is the realization of the mysteries of the Pundarika. When we perceive that the Hidden and the Manifest are of one and the same essence and realize that state of mind which is known to the Buddhas only, we have the central teaching of Tendai, that is we have attained the final enlightenment in which the spiritual and the material are thoroughly unified.

There are three sub-sects or branches in this sect, each of them having its own head-temple. They are: (1) the Tendai Branch, whose head-temple, Yenryakuji, is in Shiga prefecture; (2) the Jimon Branch, which has its head-temple in Onjoji in Shiga prefecture; and (3) the Shinsei Branch, the head-temple of which is Saikyoji in Shiga prefecture.

Shingon Sect The first exponent of this sect in Japan was Kukai (Kobo Daishi, 773–835), who went over to China soon after Saicho, the Japanese founder of Tendai. According to this sect, there are three fundamental conceptions, which are, Substance, Appearance, and Function. The Six Universals—earth, water, fire, air, the void, and consciousness—are Substances. The four systems of Mandala, that is, Great Mandala, Samaya Mandala, Dharma Mandala, and Karma Mandala, are Appearances. The three Secrets—body, words, and mind—are Functions. The Six Universals are the elemental substances of which all things are constituted. They take Apparances, which, though innumerable, can be classified under four headings. The first is the Great Mandala representing all living beings such as Buddhas, Bodhisattvas, Gods, evil spirits or human beings. The second is the Samaya Mandala which consists in Mudras and symbolic instruments of Buddhas, Bodhisattvas, devas, and spirits. The third is the Dharma Mandala containing all the names or titles of the Buddhas and other beings. The fourth and last one is the Karma Mandala in which are represented all the Functions as well as the outward bodily attitudes assumed by Buddhas and other beings. As the six Universals are infinite and mutually intermingle and are most intimately related, so the four Mandalas are also mutually related and intermingled. That is to say, the Buddhas' four Mandalas are also our own just as they are in the Buddhas, and conversely, our own Mandalas are those of the Buddhas. When the four Mandalas or Appearances are symbolized in our bodies and our fingers are "knotted" after the regular formulas, and the mouth recites the various Mantras and Dharanis, and the mind contemplates the sameness of the mind, Buddha, and all sentient beings, then the Functions of the three Secrets are completed. Let this completion be attained, and we are Buddhas while we are in this material existence.

"Mandala" has a large number of different meanings. It is often applied to concrete objects such as an altar, a platform, a circular plate, a picture, and possibly an image; but it came to have the abstract meaning of "growth", "perfection", or "a complete collection of all virtues."

This sect is sub-divided into eight branches, which are: Koya, Omuro, Daikakuji, Daigo, Toji, Yamashina, Ono, and Senyuji.

Three hundred years after the death of Kukai, the Japanese founder of the Shingon Sect, a priest called Kakuban known as Kokyo Daishi (1094–1143), established a new school of Shingon. Under this there are two branches now, one of which is Chizan and other Buzan. The head-temple of the former is Chishaku-in, Kyoto, while that of the latter is Chokokuji (Hasedera), in Nara prefecture.

Yuzu-nembutsu Sect This was found-

Digitized by Google

ed in 1117 by Ryonin, known as Showo Daishi (1071–1132). Its principal teachings are that as all things are essentially of one nature and intimately related, the virtues of one person must be also those of all others, and conversely; that the merits of the Buddha's name invoked by all earnest hearts will mutually grow, establishing a spiritual communion with one another in a most thorough manner; that therefore the invoking of the Buddha's name and contemplating him, even during this short period of one's earthly life, must bear the great fruit, if it is most sincerely done, of making us all attain to Buddhahood through the perfection of infinite merits.

The head-temple of this sect is Dainembutsuji of Osaka prefecture.

Jodo Sect The founder of this sect was Genku, known as Yenko Daishi or Honen, (1133–1212), and it was established in 1174. The basis of the doctrines of the Jodo Sect is laid upon the original prayers of Amitabha Buddha. Being convinced of the general sinfulness of human nature, which makes us incapable of enduring all the painful process of self-discipline and self-perfection, Jodo teaches us to throw all our reliance upon the strength of the original prayers of Amitabha Buddha. When we thus, absolutely believing in him, invoke his name with all the sincerity of the heart, we shall be born in future in his Pure Land. The head-temple, Chion-in, is in Kyoto.

One of Genku's disciples, called Shoku (1176–1247), established a new separate school at Nishiyama, which is known as the Seizan Branch of Jodo. This branch is again subdivided into three: (1) Zenrinji, its head-temple bearing the same title, is in Kyoto prefecture; (2) Komyoji; and (3) Fukakusa, Seigwanji, Kyoto, is its head-temple.

Shin Sect Shinran (1173–1262), who is known as Kenshin Daishi, founded the Shin Sect. He was a disciple of Genku, and the main doctrines do not vary so very much from those of his master except in this: that we, the ignorant, have no real existence, and however strenuously we may exert ourselves, we have no "causal germ" in us which will develop into Buddhahood. The priests of the sect can marry and eat flesh. The original prayers of Amitabha in which the invocation of the Buddha's name is highly recommended, testify that the causal germ of Buddhahood, by virtue of the efficiency of the prayers, will be planted in us, which means that all that is necessary for us to be reborn in the Pure Land of Amitabha is now sufficient and fulfilled.

There are at present ten branches of the Shin Sect: Hongwanji, Otani, Bukkoji, Takata, Kibé, Kosho, Idzumoji, Yamamoto, Seishoji, and Sammonto.

Ji Sect This was first promulgated by Ippen (1239–1289). The principal ideas of the sect are: Life is a frail and impermanent thing, and as every moment of it flits away, every act of ours must be regarded as the last one on earth. When, perceiving the truth of this fact, we do not neglect in every thought of ours to invoke the name of the Amitabha Buddha, we shall surely reach the final blissful state of Buddhahood.

The head-temple, Shojokoji, is in Kanagawa prefecture.

Zen Sect Under this name three Sects are comprised: Rinzai, Soto, and Obaku.

The Rinzai Sect of Zen was first taught by Yeisai (1140–1215) who came back from China in 1192. Soto finds its first Japanese exponent in Dogen (known as Joyo Daishi, 1199–1253) who studied Zen in China during the Sung Dynasty and returned to Japan in 1234. Obaku was introduced to Japan by a naturalized Chinese priest Yin-gen (1592–1673) in 1653.

The Zen Sect teaches the doctrine which is known only to the Buddhas and the transmission of which takes place only from one mind to another. It transcends logic and objective understanding. We do not have to purify ourselves from sins, nor is it necessary to seek after supreme knowledge. The ultimate truth is not in more learning, thinking, or in discipline. It is above doctrines and meritorious deeds, and also above any special attainment. Zen teaches us to abide right in the truth and reality of life, every act of which will then reveal thousands of Samadhis. Whether lying or sleeping, whether drawing water or hewing wood, every movement grows full of significance. That is why Zen sums up its teachings in the following four phrases: "No reliance on word or letter; a special transmission outside of the scriptural doctrines; a direct pointing at the soul of man; and attainment to Buddhahood by seeing into one's own mind."

There are fourteen branches in the Rinzai Sect: Kenninji, Kenchoji, Tofukuji, Engakuji, Nanzenji, Daitokuji, Myoshinji, Tenryuji, Yeigenji, Shokokuji, Hokoji, Buttsuji, Kokutaiji, and Kogakuji. The Soto Sect has two head-temples, Yeiheiji, and Sojiji. Obaku is undivided, and its head-temple is Mampukuji, Uji, Kyoto prefecture.

Nichiren Sect This was founded by

Digitized by Google

Nichiren (1222-1281) on the merits of the Saddharma-pundarika Sutra. The life of the Sect is in the seven syllables of "Na-mu-myo-ho-ren-gé-kyo," which is called "Daimoku," or a kind of theme. As this is the title of the Sutra revealing the absolute oneness of all opposites, even evil-hearted ones will attain to Buddhahood if they recite it in sincerity, and along with it all the ten universes will be equally benefited.

This sect is sub-divided into nine branches: (1) Nichiren-shu (the head-temple, Kuonji, is in Yamanashi prefecture); (2) Hommon-shu, (Hommon-ji at Ikegami, Tokyo, and six other temples in Shizuoka prefecture are its head-temples); (3) Hokké-shu, (its head-temple, Honjoji, is in Niigata prefecture); (4) Kempon-hokké-shu, (Kochoji and four others in Shizuoka prefecture are its head-temples); (6) Hommyo-hokké-shu, (its head-temple is Honryuji, Kyoto); (7) Nichiren-seishu, (its head-temple is Daisekiji in Shizuoka prefecture); (8) Nichiren-shu-fujufusé-ha, (its head-temple is Myokakuji in Okayama prefecture); and (9) Nichiren-shu-fujufusé-komon-ha, (the head-temple, Honkakuji, is also in Okayama prefecture).

Christianity

Before the Restoration Christianity was first introduced into Japan by Francis Xavier, a Jesuit Father, who came to Kagoshima in 1549. This was the time when Nobunaga Oda was at the height of his power, and he gave great encouragement to the spread of the Christian religion. Hideyoshi Toyotomi, his successor, too, was kindly disposed towards it. Combined with the devout and untiring work of the missionaries, this attitude on the part of the authorities made it possible for Christianity to gain followers with wonderful rapidity. Their number is reported to have run into hundreds of thousands.

Hideyoshi, however, changed his policy later on. Christianity was interdicted, its followers were persecuted, and the missionaries had to leave the country. When the Tokugawa Shogunate was established, still stricter measures were adopted, especially after the Shimabara Rebellion in 1637. Christianity had now no hope of prospering under the rigorous Government policy of exclusion. The only port open to foreigners was Deshima, Nagasaki, where the Dutch traders were allowed to carry on their business.

The American envoy, Commodore Perry, came to Uraga in 1853, demanding a friendly commercial treaty with his country. The Shogunate Government granted this request in 1854 not only to America, but to Russia, England, France and Holland, and in the year following the three ports of Kanagawa, Nagasaki, and Hakadaté were opened to foreign trade. A party of American missionaries were the first to avail themselves of the opportunity thus offered to them. Among them were the Rev. J. Liggins, of the Protestant Episcopal Church of the United States of America, and the Rev. M. C. Williams, who came to Nagasaki in 1859. These were soon followed by Dr. G. F. Verbeck, of the Presbyterian Church (1859), and J. Goble, of the American Baptist Missionary Society (1860), and others. In 1864, the Rev. J. H. Ballagh, of the Dutch Reformed Church, came from America, and in the following year came Dr. Thompson, of the American Presbyterian Church.

In 1869, the Rev. D. C. Greene made Kobé the basis of his mission work representing the American Board of Commissioners for Foreign Missions. The first woman missionary, Miss Kidder, of the Dutch Reformed Church, arrived here in the same year. In 1873, the American Methodist Episcopal Church and the Canadian Methodist Church sent their missionaries, and in 1876 the Evangelical Association of North America started its propaganda work.

The Restoration When the Tokugawa feudal system collapsed and the Imperial House was restored to power, the edicts prohibiting "Kirishitan" were withdrawn, in the sixth year of Meiji(1873), and missionaries were officially permitted to establish schools, publish religious tracts, and preach their doctrines in all the sea-ports open for foreign trade. In 1872, the Rev. Brown and Rev. Ballagh of Yokohama established, aided by their young followers, a Christian church to be known as the Yokohama Yaso Kyokai, which was the beginning of the Union Church. In the following year a sister church was organized at Tsukiji, Tokyo. This was the first Christian church in the metropolis. In 1876 Nagasaki saw another church established. Later all these churches were federated under the name of the United Church of Christ in Japan. This was the origin of the Nihon Kirisuto Kyokai. The Rev. D. C. Greene who started his mission work in Kobé established a church known as the Settsu First Christian Church. This was the first Congregational Church ever organized in Japan, and developed into the present Kobé Kumiai Kirisuto Kyo-

Digitized by Google

kai. In the same year the Umemoto-Cho Church came into existence in Osaka, which later came to be called the Osaka Kumiai Kirisuto Kyokai. Some time before this, thirty-five students of the Kumamoto Foreign School, who were converted to Christianity under the influence of their American teacher, Captain Janes, came up to Kyoto, and entered the Doshisha College just established by J. H. Neeshima, who had lately returned from America. After their graduation from the college they grew active as propagators of Christianity, and built up the foundations of the Nihon Kumiai Kirisuto Kyokai. In 1872, the Rev. Loomis and Rev. Ballagh conducted a Bible class for young men in the above-mentioned Church at Yokohama every Sunday afternoon. In 1873, a Congregational Missionary, Dr. Berry, set up in Kobé a Sunday-school, probably the first one conducted in the Japanese language. As to the vernacular translation of the Bible, in which Dr. Brown had been engaged for some time, the work progressed rapidly early in the Meiji Era, and the New Testament was completed in December, 1879, and the Old Testament in 1886. The chief translators were Brown, Verbeck, Greene, and Maclay, while among the native assistants were Takakichi Matsuyama, Masatsuna Okuno, Masahisa Uyemura, Kajinosuké Ibuka, Goro Takahashi, and others.

Y. M. C. A. In 1880, the Young Men's Christian Association was first organized in Tokyo, and among the leaders must be mentioned Hiromichi Kozaki, Kajinosuké Ibuka, Masahisa Uyemura, and Yoshiyasu Hiraiwa.

In 1870, Miss Kidder opened a school for girls in Yokohama. This was the first institution of the kind in Japan, and from it developed the present Ferris School for Girls. Four years later another girls' school, Kobé Jo Gakuin, was erected in Kobé by the Congregationalists.

According to the statistics of 1882, there were in that year 145 foreign missionaries, 93 organized churches, 13 of which were self-supporting, 4,367 adult members, 39 mixed schools, 15 girls' schools, 9 middle schools, 7 theological colleges, 109 Sunday-schools, 49 ordained preachers, 100 assistant preachers, 37 Bible women, and 5 hospitals.

In 1883, the Church of Christ sent missionaries to Japan, and in 1885 the Presbyterian Church of the United States of America did the same. The American Society of Friends, and the Evangelical Protestant Missionary Society of Germany and Switzerland also despatched their agents. In 1886, missionaries came from the Methodist Episcopal Church, South, and in Osaka a hall was set up for the Young Men's Christian Association. In 1887 the missionaries and representatives of the Episcopal Church of England and America had a conference, the result of which was the organization of the Holy Catholic Church of Japan. In the same year, the American Unitarian Association sent its representative, the Rev. A. M. Knapp, and following him came the Rev. Clay McCauley.

Freedom of Faith On February 11, 1889, the Constitution was promulgated, and freedom of faith was definitely guaranteed by Article XXVIII. In that year, L. D. Wishard, International College Secretary of the Young Men's Christian Association, came, and planned out a summer school for Bible study for the first time in this country. Since then every summer sees its work carried on. The United Church of Christ in Japan changed its name into the Church of Christ in Japan, compiled a fundamental law, settled on its creeds, and at last became an independent organization. Soon after, they put up a Board of Missions and made progress towards financial independence.

In 1890, the Universalist General Convention of America sent its missionaries. In 1895 officers of the Salvation Army came, and Gumpei Yamamuro joined it, and they at once started on their propaganda work. In the same year, the United Brethren in Christ started a mission.

Until 1901 the foreign missionaries had not been allowed to hold land in Japan, which greatly inconvenienced their activities. In that year the Home Minister gave permission to the Baptist Missionary Society in Japan to organize a corporation which could hold and manage lands and buildings for missionary purposes.

In 1905 the Japanese Congregationalists planned to be financially independent of the foreign mission by the end of this year; in this they were later successful.

In 1907 representatives of the Mthodist Church of Canada, the Methodist Episcopal Church, South, and the Methodist Episcopal Church convened in Tokyo with a view to effect a confederation of the three denominations in Japan. The First General Conference of the Methodist Church of Japan thus took place, and Yoichi Honda was chosen to be its first Bishop and was duly consecrated. In the same year F. L. Brown, of the International Sunday School As-

Digitized by Google

sociation, arrived and the outcome of this visit was the organization of the Sunday School Association of Japan, marking an epoch in the history of the Sunday School of the Christian Church. The conference of the World's Student Christian Federation was also held this year in Tokyo, in which 160 foreign visitors took part representing twenty-five nations. This was the first world's convention of any kind in Japan.

Roman and Greek Churches. The Catholic Church has been active ever since the opening of the seaports for foreign trade. Missionaries from the Societé des Missions Etrangères in Paris are working all over the country, which is now divided by them into seven districts: Tokyo, Osaka, Hakodaté, Nagasaki, Shikoku, Niigata, and Sapporo, with a Bishop resident in Tokyo. In Shikoku there is a Spanish Dominican mission, while in Hokkaido the Franciscans have found their principal fields of activity, where are two Trappist monasteries. The Jesuit missionaries reached here again in 1908, but instead of following up their predecessors' work, they have now a college established in Tokyo and concentrate their efforts on education. Besides the Jesuits, those that are chiefly engaged in educational work are the Missionnaires de Marie, Société des Soeurs de Saint Paul, Société de Sacré Coeur and others. In the prefecture of Nagasaki, Catholics, who have been at work for the last three hundred years, though secretly, are still in the ascendency.

The activities of the Greek Church centered in the person of the Russian priest Father Nicolai, who came to Japan first as priest attached to the Russian consulate in Hokkaido in 1859. He reached Japan after crossing Siberia, and after settling in Hakodaté he baptized Takuma Sawabé and two other Japanese. In 1872 he came to Tokyo where he began missionary work. In 1884 he started to build a fine large church in Tokyo, which was completed in 1891. The church was regarded at that time as the greatest and finest building of the sort throughout Japan. The internal disturbances in Russia which followed the great world war made it very difficult to maintain this beautiful edifice, until in 1919 the followers succeeded in organizing an independent church known by the name of the "Orthodox Church of Christ in Japan."

Islam

Among the world religions Islam has given the smallest influence over the Japanese people. The Koran was translated into Japanese early in the Meiji Era (1868–1912), but the faith could not obtain many adherents, simply because it did not come to Japan with any political or economic elements accompanied. Islam is not yet officially recognized by the Japanese Government and the number of the Islamites in Japan is unknown, although it is believed that there are several hundreds of them in the land.

In August, 1937, the Islam Cultural Association was organized in Tokyo. Its president is Ryusaku Endo, and it issues a magazine "Islam" for the promotion of Islam culture in Japan. A mosque was built in Tokyo, early in 1938, by the hand of the Japanese Islamites. The friendly attitude of the Islamites in China and Islam countries toward Japan since the occurrence of the Sino-Japanese Conflict in 1937 has aroused a general sympathy and interests of the Japanese people on the religion and its believers.

State Regulation of Religions

Supervising Office A wholesale change of the governmental system took place at the time of the Restoration, and in the third year of Meiji (1870) the Mimbusho was established to take care of various affairs of the state, such as general home affairs, communications, etc. In the fourth year, this office was abolished, and the office of religious affairs was transferred to the Finance Department. With the establishment of the Kyobusho, or Department of Religions, in 1872, the shrines and temples were placed under the care of the new office. Then the Government appointed Shinto and Buddhist priests as official religious instructors who were to preach and educate the people according to the moral principles as follows: (1) to cherish reverence for the gods and the spirit of patriotism; (2) to elucidate Heavenly Reason and the principle of humanity; and (3) to honour and pay homage to the Emperor and to observe the Imperial ordinances. Afterwards the Kyobusho was abolished too, and all the business conducted by this office up to that time was transferred to the Department of Home Affairs which was established in 1873. The official appointment of religious instructors (Kyodo-shoku) was discontinued in 1884, and the business of appointing preachers was entrusted to the head-priests (Kwancho) of the various religious sects, together with the right of selecting the resident priest (Jushoku) for the temples under their jurisdiction.

Digitized by Google

Each sect was, moreover, given the power of managing its own affairs under the supervision of the Government. Religion was thus separated from politics. With the promulgation of the Constitution on the 11th of February in the 22nd year of Meiji (1889), the principle of religious freedom was firmly established. In April, 1900, the former Bureau of Shrines and Temples was divided into two sections, i.e., the Bureau of Shinto Shrines and the Bureau of Religions. All administrative policy concerning the Shinto Shrines is now in charge of the former and is entirely independent of the policy governing religions. The Bureau of Religions was transferred to the Education Department in 1913, and is under its jurisdiction at present.

Administration of Religions At present, there are three kinds of religions in Japan. These religions are dealt with by the Government each in a different way, because Japan is still without specific laws defining the political status of these religions in connection with the State, though the principle of the administrative policy can recognize no such difference, as the Constitution gurantees freedom of faith. The Government, however, finds it natural not to mete out a uniform method of supervision over all these religions; for Buddhism, which has been in very close relation to the State and society for over one thousand years, and Shinto, which is the national cult of Japan, and Christianity, which was introduced to this country only half a century ago (putting aside the fact that it was once in this country a few centuries ago) can hardly be treated in a uniform method with satisfactory results.

From a practical point of view, the religious denominations or sects which are officially recognized and come under the proper jurisdiction of the Bureau of Religions at present are Shinto and Buddhism. A religious order is a congregation of preachers and adherents following a definite system of creeds having temples or preaching halls from which their religious movements issue. Shinto and Buddhist sects have not yet special regulations concerning cases of secession or incorporation, inasmuch as they are not allowed to make such regulations without the approval of the Education Minister. But affairs concerning the inner policy of the various sects are generally left to their own self-government, though the religious sects concerned are required by the State to compile fundamental rules defining their administrative policies approvable by the Education Minister.

Alteration of Rules The approval of the Education Minister is also required when they abolish or alter these rules. Each sect, Shinto or Buddhist, is required by the Government to select a head-priest, or Kwancho to govern and represent that sect. The appointment of a head-priest also requires official approval. In the compilation of a constitution for each sect they have to define the following particulars: (1) the fundamental law, (2) the status of the preacher and his official title, and (3) the grades of preachers and their appointment and dismissal. These particulars are to be regulated by each Shinto head-priest. Meantime, each Buddhist head-priest is to regulate the following particulars: (1) the fundamental law, (2) rules concerning the management of temples, (3) the status of the priest and preacher and their official titles, (4) the appointment and dismissal of the resident priest, or Jushoku, of a temple, and grades of preachers, and their appointment and dismissal, and (5) the preservation of old historical documents, treasures, and properties belonging to the temples.

Besides thus defining the particulars as stated above, the constitution of each sect has to regulate, through practical necessity, various affairs concerning its self-government. It must define, for instanace, the functions and powers of the head-priest and the method of election; the organization and power of the council; functions of various officers; financial affairs; organization of a temple or a preaching hall; qualifications of a resident priest; affairs relating to the personnel, such as conferring honours or giving punishments; missionary work; education; and other functional activities.

While all the Shinto and Buddhist sects are thus placed under the direct supervision of the Government as far as such fundamental affairs as are mentioned above are concerned, they are left to the care of the local governments concerning the practical functionings of their propaganda work. When the Shintoists or Buddhists want to build their temples or preaching halls, for instance, they must approach the local governments for permission. As Buddhist temples are, on account of their historical significance, regarded as legal persons, the use of the temple grounds, changes in their acreage, cutting down of the trees, and disposition of immovable property, temple treasures, historical documents, or fundamental funds, etc. all require the ap-

Digitized by Google

proval of the local governor concerned.

Special Treatment of Christianity The Government gives no official recognition as regards the Christian denominations, because they, as such, stand in no legal relationship to the Government. In the case of Christianity, therefore, the official supervision does not go further than looking after its missionary activities, selection of preachers, establishment of churches or preaching halls, etc. The Ordinance No. 41 of the Education Office issued in 1899 requires that those who wish to engage in missionary work notify the local governor of the name of their religion and methods of preaching, with their personal history. When they want to build churches or other establishments for religious purposes, they have to approach the local authorities for permission, stating details of these establishments, methods of management and maintenance, qualifications of the preacher, and the process of selecting such preacher. In other words, the Government has special provisions for the Shinto and Buddhist denominations because of their peculiar historical status, while it is contented with being a mere overseer as regards Christianity. As far as their religious functions are concerned, however, the Government makes no distinction whatever between Shinto and Buddhism and Christianity. All religious sects are left to themselves unmolested as long as they do not disturb the peace of the country or practise immorality in connection with the propagation of their doctrines and the carrying out of their respective religious rituals.

New Religious Law

The bill for Control of Religious Organizations (Shūkyō Dantai Hōan) which was presented and approved by the 74th session of the Imperial Diet was framed on the basis of the summary draft of a measure adopted and submitted to the Cabinet by the Commission for the Investigation of Religious Systems after deliberations lasting from November 14 to December 10, 1938. This bill is comparatively simple in form and consists of 37 articles.

The enactment of a comprehensive law applying to religions has long been an issue in Japan. Bills were submitted to the Diet three times after 1899, but were shelved each time for varying reasons.

The importance of religion becomes heightened in time of national emergency. In Japan today it has been realized that some fixed regulations should be established for the protection and promotion of religious organizations. Essentially, religion is spiritual or ultramundane and is therefore extralegal. But inasmuch as religious teachers in Japan are Japanese subjects and religious organizations enjoy existence under protection of the law, specific legislation pertaining to them is inevitable and necessary for promoting, however indirectly, their healthy activities.

Existing ordinances relating to religions are diversified and lack uniformity. They consist of various ordinances, instructions and orders of different governmental departments, numbering more than 300, issued from the beginning of the Meiji Era. Their effect has been to impair the administrative and other activities of the religious organizations themselves. The present trend of national affairs suggests not only the need of legal unification of these separate regulations but also that of issuance of a new and complete law in order to prepare the way for the development of religious orders of sound character, which actually make contributions toward national life by protecting and extending assistance to the people. There is also the need of supervising the possible conduct of unhealthful doctrines detrimental to public welfare and peace.

Essential Points 1. The new law is to be applied to both religious organizations and religious societies. A religious organization (Shūkyō Dantai) is understood to be an association of believers organized for the purpose of advocating a religious faith and of conducting rituals; its establishment is recognized by the Minister concerned or by the Prefectural Governor according to specific regulations provided in the law. A religious society (Shūkyō Kessha) is understood to be an organization of believers organized similarly for the purpose of advocating a faith and of conducting rituals, but which is not considered by the State as coming under the category of a religious organization. As a matter of fact, the religious society is a new name for bodies hitherto known as "groups of believers in a faith analogous to a religion" (Ruiji-Shūkyō Dantai).

2. The proposed law groups all religious bodies into five classifications: Shinto sects (Kyōha), Buddhist denominations (Shūha), Christian and other religious organizations (Kyodan), temples, and churches. Actually, the first

Digitized by Google

three of these include the latter two.

In regard to Shinto sects and Buddhist denominations, there has existed a basic law, however incomplete it may have been, known as Ordinance No. 19 of the Dajōkwan (predecessor of the present Cabinet) issued in 1884. Christian churches and other religious organizations have been left untouched, placed outside the purview of the Ordinance. The proposed law, therefore, includes them as religious organizations similar to Shinto sects or Buddhist denominations.

In principle, Shinto, Buddhism and Christianity are to be treated equally in accordance with the terms of the law. They have, however, different historical and social backgrounds. Accordingly, the law gives separate names to these religious bodies (the above-listed Shinto sects, Buddhist denominations and religious organizations belonging to Christianity and other faiths) to place a certain demarcation between them. However, in contrast to the old regulations which spoke of the religion "other than Shintoism and Buddhism," the new law names Christianity as a religious organization.

3. Establishment of the religious organizations prescribed in the law must obtain official recognition of the competent Minister in the case of the first three groups mentioned in Paragraph 2, or that of the Prefectural Governor in the case of individual temples or churches. Official recognition shall be given only to those organizations that have good traditions and stand on sound foundations, spiritual and material, and make laudable contributions to the nation and to society. The State undertakes to give protection and award special privileges to the religious organizations thus recognized.

According to the proposed law, for example, (1) the privilege of exemption from the income tax, which was hitherto enjoyed only by Buddhist temples, shall be extended to all other religious organizations; (2) the land tax shall not be levied, in principle, on the precincts of temples and churches; (3) the local surtaxes shall not be levied on the income of religious organizations as well as similar taxes on the precincts or buildings of temples and churches which are already exempted; (4) the privilege of being exempt from registration fees shall be extended to the registration of the precincts and buildings of temples and churches; and (5) attachments on the buildings or their lots which are used for public worship by the organizations and on the treasures of temples and churches are, in principle, prohibited.

4. As to protection, the special provisions included in the new law for the creation of a juridical person by the religious organizations provides for a new method of protection.

At present Buddhist temples only are allowed to create such legal persons, although the provisions pertaining to legal persons in the civil code have rarely been applied to them. No regulation exists for the creation of a juridical person by either Shinto sects or Buddhist denominations or Christian organizations.

The new law prescribes that Buddhist temples shall be juridical persons, and that Shinto sects, Buddhist denominations, Christian and other religious organizations and churches may be juridical persons. The law also contains many other provisions relative to this matter. With legal entity thus established, the organizations may be able to solve many of their financial problems and function in a less involved manner.

5. When they meet with bankruptcy, the religious legal bodies are to be dissolved just as secular corporations are, according to the law. But the dissolution of religious organizations merely on account of financial insolvency or acquirement of heavy debts, without taking into account their spiritual aims, origin, history, traditions and existing status, may appear unreasonable.

Accordingly, the proposed law, which may order dissolution of a religious organization, makes a series of special provisions to ameliorate this situation. In case the organization becomes bankrupt, (1) the State may leave it as a recognized religious organization for the time being; (2) the competent Minister may cancel his recognition as such when he comes to the conclusion that the organization cannot be saved by any means; and (3) with the cancellation of recognition, dissolution may take effect.

These provisions may be described as legal grace granted to religious organizations in recognition of their spiritual nature. Application of legal measures against a spiritual body only for secular reasons is contrary to the spirit of the new legislation.

6. The new law states that "the representatives (Sōdai) of the laymen shall assist the head monk or the super-

Digitized by Google

intendent of a temple or church in matters of administration." Formerly, the relations between spiritual leaders and the representatives of the believers were very harmonious and the latter were proud of being "great supporters" or "secular protectors" of the spiritual institutions and willingly lent their services to them. But the recent trend in and out of Buddhist temples demonstrates that this custom is on the wane. The insertion of this provision in the new law is aimed at the sound management of secular affairs indispensable to the existence of temples or churches. Harmony between a temple and its parishioners, in particular, is indispensable for the effective management of temple affairs and at the same time may give a spiritual basis to the dealings of members of communities among themselves.

7. The important protective measures and privileges given to religious organizations by the law, as outlined in foregoing paragraphs, are to be extended only to religious organizations and not to religious societies, as defined in Paragraph 1.

Application for establishment of a religious society must be made by a proper representative to the Prefectural Governor within two weeks of the founding. Neglect in this regard or the presentation of a false report is punishable by fine.

In regard to the formation of new religions or quasi-religious cults, this has hitherto been placed under the jurisdiction of the police. But in view of the present state of ideological affairs, the new law assumes partial jurisdiction and applies to such religions those regulations concerning application for recognition and other conditions specially prescribed for the supervision of the religious societies, with the purpose of halting the unworthy ones in the bud or fostering the worthy ones to healthy growth. According to the provisions of the proposed law, a way is opened to the religious societies to advance to the status of religious organizations.

The inclusion of these societies in the Law for Control of Religious Organizations may be criticized as incongruous. But it is a matter of no little importance in encouraging the general growth of religions that the law gives them a place side by side the major religious organizations defined in Paragraph 2 and affords them the opportunity of raising their status.

8. The new law includes many regulations for supervision over religious organizations and societies, but reference here shall be limited only to those which have relation to Article 28 of the Constitution of the Japanese Empire.

Article 28 states: "Japanese subjects shall, within limits not prejudicial to peace and order, and not antagonistic to their duties as subjects, enjoy freedom of religious belief." Thus, although the Government has been empowered to resort to any means of restraining against the deeds of religious believers prejudicial to peace and order and antagonistic to their duties as subjects, no special regulations have been enforced to this effect.

The new law provides measures of restraint against religious preaching, rituals or conducts contrary to the prohibition clauses of Article 28 of the Constitution, giving the competent Minister power to cancel the official recognition of the establishment of religious organizations.

9. According to the provisions of the new law, religious groups may appeal to or sue the courts for redress against unreasonable decisions on the part of supervising authorities. This is a new feature in religious regulations in Japan. Where (1) the recognition of the establishment of the religious body is cancelled; where (2) preaching, rituals or other religious functions are restricted or prohibited as prejudicial to peace and order and antagonistic to the duties of the members as subjects of the Empire; and where (3) their conducts are ordered to cease or are prohibited as detrimental to public welfare, the aggrieved group or individual in the group may appeal for redress. Religious organizations who feel that their rights have been injured by the alleged unlawful cancellation of recognition or establishment may appeal to the Court of Administrative Litigation.

10. After legal organization of the religious organizations is completed and their finances are stabilized according to the law, the greatest problem connected with their activities is the human problem of obtaining the fittest persons for preaching and execution of rituals so that their faiths may be spread among the people and their organizations gain spiritual influence in society. The ability of these ecclesiastical leaders (the new law designates them as "teachers") bears direct consequence on the success of the religious organizations.

The new law, however, includes no

Digitized by Google

provision for fixing the qualifications of the religious teachers and leaves the matter to the private regulations of the different bodies themselves, not from any neglect of the importance of the problem but to avoid possible friction with the traditional usages of different bodies which have their own individual standards, differing from those of other groups in doctrines, creeds, history and traditions. Any unification of such qualifications throughout different religious bodies may be considered an interference with their free religious activities and might, in the end, "kill the bull to strengthen its horns," as a Chinese proverb relates.

Many other important matters exist which the new law leaves untouched solely because the State wishes to respect the self-government of each religious organization and to refrain from bringing different religious bodies under a single sweeping standardization.

Religious Statistics

The following are the statistics of preaching halls, preachers and adherents of various religious sects and denominations:

SECTARIAN SHINTO IN JAPAN PROPER

(End of 1936)

Denomination	Preaching Halls	Preachers			Adherents (in 1930)
		Men	Women	Total	
Shinto	623	3,952	810	4,762	1,206,778
Kurozumi	451	3,606	502	4,108	551,236
Shusei	222	1,864	331	2,195	411,801
Taisha	208	2,970	97	3,067	3,343,477
Fuso	600	4,035	1,376	5,411	486,906

CHAPTER XXX

SOCIAL PROBLEMS AND SOCIAL WORKS

Social Problems

These may in the main be summarized under 6 headings:

(1) Poverty and Its Relief. In Japan the gap between rich and poor may not be quite so great as in some Western countries, but nevertheless it exists, and tends in some ways to become greater with the industrialization of the country. Poor-relief is one of the greatest problems of the authorities, for it must include the city slums, the beggars, and the increasing number of peasant paupers. In March, 1936, the number of the poor listed as coming under the poor relief protection law was 2,207,764 or 3.1 per cent of the total population in Japan proper.

(2) Condition of Labourers. This, with the attendant matters of pay and hours, especially in relation to international labour conferences and agreements, calls for careful Government handling: the protection of child and woman labour particularly so. Labour conditions in 1936 and 1937 improved in a considerable degree because of the expansion of the heavy industries.

(3) Position of Women. The protection of women and the elevation of their social and legal status is in some ways especially an Oriental problem. Socially their position has been much raised of late years, so that it now approximates nearly to that of men; but the old discriminative laws enacted in the Meiji Era still handicap women in many respects. In regard to the age-old question of licensed prostitution the Government is planning the entire abolition of the system within a year or so, and statistics show a slight decrease in the last few years, largely owing to the increase in the number of other places of entertainments.

(4) Public Health. In a country which carries such a dense population this is a matter of vital importance. Medical science in Japan is second to none in the world with regard to its recent progress and present position, her doctors and surgeons having made contributions of inestimable value to mankind, and in some cases paid for them with their lives. But difficulties attend its application. The cost of treatment and of drugs and chemicals is high, and suggestions have been made for the nationalization of all medical business in order to help the poor. In January, 1938, a new Ministry of Health and Social Affairs was established for the purpose of improving the health conditions of the people.

(5) Thought Guidance. The guidance of the people's thought through the eddying turmoil of modern ideas and theories, from Marxism to Fascism with all intermediate shades, and the handling of practical matters connected therewith, are of the very gravest concern to this country, and are engaging the deepest attention of the authorities. The final settlement of these matters must be largely dependent on that of the preceding problems, though some consider that more radical and direct action is necessary for its attainment than merely so-called social work. But inasmuch as most of these movements, radical or reactionary, include schemes for the sudden overthrow of the existing social system, neither the Government nor the people at large can regard them with unconcern.

(6) Extraordinary Social Problems (A) Change of Occupation. As a result of the enforcement of the plan for mobilization of materials in connection with the China Affair, considerable numbers of merchants and manufacturers have been forced to suspend or close their businesses, or to curtail business operations. Such industrialists and tradespeople have to be helped to tide over the emergency by entering war-supplies industries and such other trades as are calculated to remove anxiety and unrest.

(B) Care of Wounded Soldiers. Another grave problem arising out of the armed conflict with China is the care of wounded soldiers. The authorities and the people are doing their best for the protection and care of soldiers disabled by injuries or by illness. Mentions are given on these extraordinary problems at the end of this chapter, together with the store law newly instituted for the health and hygiene of employees in shops.

The fourth problem, relating to Public Health, is specially treated in Chapter

Digitized by Google

XXXII, while further reference is made to the others in the chapter on Labour.

Social Work

Before Meiji Era Prince Shotoku, Regent, established, in 593, Hidenin (a house for the poor), Sheyakuin (a medicine house for the poor) and Ryobyoin (a house for the sick). In 730 the Empress Komyo founded Hidenin and Sheyakuin at Nara. She herself washed the bodies of the poor and nursed the lepers.

Among the many benevolent works which he did at places where he stayed during an evangelistic journey through the country, Gyoki, a Buddhist monk who lived at the time of the Emperor Shomu (724–749), established 9 public lodging houses and a public bath-house at Arima hotspring near Kobé

Hokin-in, a Buddhist nun and sister of Wake-no Kiyomaro, a famous loyalist, made an appeal for, saved, and took under her care 375 rebels who were sentenced to death in 764. When a little later, at the end of the 8th century, famine struck Kyoto and children were abandoned on the streets she gathered 83 under her motherly care. This was the beginning of orphanges in Japan. Her example was followed by the Empress Masako, consort of the Emperor Junna (823–833), who took care of many orphans and abandoned children in Kyoto, and established in 876 a leper asylum in the precincts of Daikakuji temple, Kyoto.

In 1180 Jugen, a monk, built 15 public bath-houses for the poor. Kosho, another Buddhist monk, worked for prisoners, taught beggars and outcasts to refrain from drinking, and instructed prostitutes in the doctrines of Buddhism.

The monk Ninsho of Seidaiji temple, Nara, followed the example of Prince Shotoku and repaired houses for poor patients and lepers. For lepers he built an asylum which is still standing at Kitayama, Nara, and is under Government protection as a specimen of social work of early times. Later he became the superior of Gokurakuji temple at Kamakura and established, in 1287, an asylum for the poor. In the following 20 years the asylum accommodated over 57,250 patients, of whom over 46,800 were cured. At the foot of Kamakura hill he also built a house for sick horses.

Public baths for the poor were prevalent in the Kamakura Age (1192–1337). It was during this period that nunneries were first opened for the protection of women who were maltreated by their husbands, somewhat in the manner of the six cities for refuge mentioned in the Old Testament, Numbers, chap. 35. Two of these have remained to the present day: one, Tokeiji at Kamakura which was rebuilt in 1285 by Sadatoki Hojo for his mother; the other, Mantokuji in the country of Nitta, Gumma prefecture, which in the year 1591 was to accommodate a daughter of the Tokugawa. These nunneries were highly admired since some of the nuns came from the high warrior class and could stand against local authorities in protecting the weaker sex who took refuge in the nunneries. They became known as Enkiridera or divorce temples.

In 1670 Tsunanori Mayeda (1643–1742), the lord of Kaga, present Kanazawa prefecture, established public lodging houses for beggars and poor patients on a hillside south of his castle in Kanazawa. There were 45 houses, each measuring 12 by 120 feet. When opened 1,753 beggars and outcasts were taken in. Poor travellers were given expenses at leaving and unemployed artisans were cared for till they found suitable posts, while others were taught small trades. One of the latter was skilled in sword making and swords signed by the swordsmith "Hinin Kiyomitsu" or beggar Kiyomitsu are highly admired as masterpieces.

The blind were, from early times protected by the Imperial House and in the Nara Age the Kugas took charge of them by Imperial order. Music was taught them to enable them to earn a living. There thus arose many first class blind players of the "biwa" or the "koto." In the Yedo Age the blind received relief money or were trained in acupuncture and massage. In 1722 the Tokugawa Shogunate built an asylum at Koishikawa, Yedo (Tokyo) for patients of the poorest class. The capacity at first was 40 beds, but later it was increased to 150.

Kanonko, a Buddhist corporation, was established in 1830 by Sukenari Naha of Akita. Later 72 donors came to his help and the aged, invalids, the sick, the deformed and the mentally deficient were cared for. In 1930 the corporation had a fund amounting to ¥51,887 and 2,760 koku of rice.

The above are a few examples selected from among numerous recorded instances of social work in old Japan. It must also be noted that relief work either by the government or individuals necessarily followed natural calamities in all ages on a considerable scale.

Meiji Era The Nagoya earthquake in 1891, the North-Eastern tidal wave damages and the famine in 1896, had quickened the development of orphanage work,

Digitized by Google

and at the time of the Sino-Japanese and Russo-Japanese wars relief work for soldiers, child protection, and free medical treatment were also being taken up but mostly by philanthropic individuals so they hardly differed from the old-fashioned benevolent and rescue work. The World War served as a great stimulus for the development of modern social work, for the economic, social and moral changes suddenly brought about at that time and after the great conflict raised various kinds of social problems and at the same time accelerated progress in all kinds of social work, such as relief of the poor, free medical treatment, provision of houses, employment exchanges, child protection, settlement work and the like. The great earthquake of 1923 was an epoch-making event from the standpoint of the development of such work.

From the beginning of the twentieth century the Japanese Government has passed many laws on social work, the most important of them being :—the Military Relief Act of 1917, the Tuberculosis Prevention Act of 1919, the Employment Exchange Act and the Housing Association Act of 1921, the Health Insurance Act of 1922, and the Insanitary Houses Improvement Act and the public Pawnshops Act of 1927.

Social Bureau In regard to the administrative organization of social work, before the World War there were only a few officials engaged in reform and relief work, and these were tucked away in one corner of the Department of Home Affairs. But in August, 1917, a relief section was established in its Local Government Bureau. In 1919, this section was called the Section of Social Affairs and in 1920, it became the new Bureau of Social Affairs and a central organization for social work; in 1922, the present independent Social Bureau came into existence and the administration of all social work throughout the country was brought under its control. In January, 1938, the Bureau was merged into the Department of Health and Social Affairs. The conditions of social work in Japan for the year ending March, 1935 were as follows : the number of social work institutions and organizations, both public and private, was 11,908, with an annual expenditure of ¥98,289,000, including ¥14,967,000 of the Governmental social works and subsidies and ¥83,322,000 of the social works carried out by local governments; and the total amount of their property was estimated at ¥270,933,000. The number of persons engaged in the social works was 62,505.

The present tendency of Japanese social work is paving the way for the transformation of social work into a definite governmental social policy. While the old benevolent work has developed into the present social work, the fundamental idea and methods have undergone a great change. The present social work is carried on not necessarily with the idea of benevolence but rather on the principles of social solidarity and mutual help. From the standpoint of public welfare and mutual responsibility, modern social work has as its aim the solution of social problems and positive social reconstruction to accomplish the social welfare policy in co-operation with legislation on labour and social insurance.

Imperial Participation The Imperial House has been playing a leading part in the promotion of Social work in Japan. Not to speak of the Imperial gifts in olden times, the Imperial donation of ¥1,500,000 in 1907 was the commencement of modern social work in Japan on a considerable scale because it called forth contributions from the people amounting to ¥24,350,000, and a society was organized for medical treatment for the poor. The annual Imperial donation for representative social work all over Japan was begun in 1921. The Imperial donation amounted to ¥179,300 for 787 institutions in 1934, ¥200,000 for 798 institutions in 1935 and ¥195,000 for 789 institutions in 1936.

Administration and Expenses

Social Work Administration The matter of paramount interest at the beginning of 1937, was the improvement of the administrative system of labour exchanges, the institution of the Mother and Child Protection Law, and the revision of the Military Relief Law, the Relief Law, and the Ainu Protection Law, which were passed during the 70th session of the Diet.

In order to investigate all phases of social work the Social Work Investigation Commission increased the number of its members in July, 1936, and the above social laws were drawn up according to the advice of the Commission.

Legalization of Homen Iin (Block Committee) System The Homen Iin or Block Committee system consists in the appointing, by prefectural governors or other responsible bodies, of honorary committees of those private persons who are interested in social work and are able to get in easy touch with the people who need relief, so that proper relief is given the poor and the maximum results obtained. The system originated

Digitized by Google

with the establishment of an advisory committee to the Saiseikai association in Okayama prefecture in 1917. Since then, partly because of the recent trend in social affairs and partly by the recognition of the good results brought about by the activities of the Committees, the system has spread to not only all prefectures in Japan proper, but also to Taiwan and Chosen. The promulgation of the revised Relief Law in 1931 required greater activity of the committees.

At the beginning of 1936 the number of the Block Committees reached 40,700 in Japan proper and some 1,300 in the Colonies. The managing bodies of this system are the prefectural authorities, though there are a certain number of city, town or other private organizations. At the end of 1934 the system was established in 8,236 cities, towns and villages, while there were 3,297 without it.

The number of cases handled by the Block Committees increases every year, the figure for 1935 being 6,000,000. The number of poor families registered on the cards of the Block Committees all over Japan proper reached 490,000 with over 1,990,000 people at the end of 1934, their proportion to the total population of the country being about 5% in urban and 2.5% in rural districts.

Inasmuch as the Block Committees exercise a function which bears upon the fruits of the social policy and enterprises of the country, the necessity of legalizing the system has been pointed out not only by the committees themselves but also by others. Reasons for legalizing the system are: first, by giving it legal status the Government may utilize the system for carrying out smoothly various kinds of administrative work and may increase efficiency in the administration of social work; in the second place, the function of the committee is not only to give material aid to the needy but also to improve their moral character. Their guiding principles, therefore, should be clearly set out in law; and in the third place, the work of the committees has in the past been carried out independently in the various districts so that the management and results have differed widely and national unification and proper control have become necessary. The Imperial Ordinance for Block Committees (Imperial Ordinance No. 3,980 of 1936) was promulgated on November 14, 1936 and was enforced as from January 15, 1937. The principal points to be noticed in the Ordinance are that guiding principles and the duties of the committees are clearly stated; that except in Tokyo and Yokohama the work is to be under prefectural management; that the selection of the committees has been made very strict; that the Block Work Commission has been established and that heads of cities, towns and villages are to be present at the meetings of the commission to make the relations between the committees and city, town and village authorities closer.

CONDITIONS OF THE WORK OF THE BLOCK COMMITTEE

(March, 1935)

Number of committees.

Prefectural	City	Town and village	Private bodies	Total
45	6	26	3	80

Number of blocks.

Total number of cities, towns and villages in the country	Those having the system	Those not having the system
11,382	8,085	3,297

	Towns and villages	6,665,963	55,696	169,369	225,065
House members	Cities	21,975,800	459,470	640,906	1,100,376
	Towns and villages	35,396,049	183,331	706,367	889,698

Revision of the Ainu Protection Law As regards the protection of the aborigines or Ainu of Hokkaido the Ainu Protection Law was enacted in 1889.

Digitized by Google

But since the Ainu have advanced in many ways, and conditions in Hokkaido have changed with the progress of development work in the island, it became necessary to revise the law to conform with the changes in the life of the Ainu and their environments. The revised Ainu Protection Law which was passed in the 70th session of the Diet recognizes the use of land to some extent, as a means of extending relief.

For Koreans The number of Koreans in Japan proper which was 118,000 at the end of 1924, increased to more than 608,000 at the end of 1935. Their language, manners, and mode of living differ so widely from those of the Japanese that they were liable to cause much trouble, and it was decided to educate, lead and encourage them to raise their standard of living. For that purpose a sum of money was budgeted and proper facilities given.

Expenses The expense for social work are derived from three sources, State, local and private. These expenses have increased on account of the rapid development of the work, especially since the rice riots in 1918 and the Great Earthquake of 1923. The estimated expenses of social work borne by the National Treasury for 1937–38 reach ¥18,172,156. As the result of merging the Social Bureau into the Department of Welfare in 1938 the budget is included in the budget of the new Department which is given in Chapter VIII, Public Finance.

Child Protection

Child protection in Japan is divided into the following nine main classes :— (1) Care for women in pregnancy or confinement, (2) care for infants, (3) for weakly children, (4) for children of the very poor, (5) for the education of children, (6) for child-workers, (7) for maltreated children, (8) for children to be reformed, (9) for abnormal children and (10) for mother and child.

Women in Pregnancy or Confinement The infant mortality rate of Japan was lower until 1900 than in Western countries, but since then it has gradually risen, till it reached the deplorable figure of 189 deaths for every 1,000 births in 1918. Though there has been a decrease since then, in 1936 the rate was still as high as 11.6 per cent. As for the still-birth rate, though there was some tendency towards decrease, it was 5.0 for every 100 births in 1936, the total number of still-births reaching 111,056, that is, 1.58 for every 1,000 of the population. The greatest emphasis in child protection is laid on the protection and aid of expectant mothers, or the protection of children before and at the time of birth. For this kind of work there are at present such organizations as maternity hospitals, visiting midwives and confinement advisory institutes, besides legislation for maternity protection. In March, 1936 there were 52 maternity hospitals throughout the country, while visiting midwives' organizations numbered 493. Legislation for maternity protection is included in the Factory Law, the Mining Law and the Health Insurance Law. The first two laws provide that owners of industrial and mining plants shall not require expectant mothers to work if they apply for leave of absence; after child-birth the mother shall not be required to resume work for 6 weeks, though if she requests work after 4 weeks and a doctor certifies her as fit, she may be allowed to resume it.

According to the Health Insurance Law, persons insured are to receive 20 yen for the expenses of confinement and also a daily amount corresponding to 60 per cent of each day's wage throughout the non-productive period for 28 days before and 42 days after childbirth.

Infant Protection The institutions now existing are divided into the following four kinds :—(a) hospitals for the unweaned pauper infants, (b) day-nurseries, (c) institutions for providing milk or other nutritious food for sickly and undersized children, and (d) infant health consultation institutes.

(a) Infant hospitals. There were 29 infant hospitals in the country in March, 1936. Of these 5 were established by public authorities and the rest were managed by private bodies or individuals.

(b) Day-nurseries. The demand for this work has become greater year by year, owing to the recent development of industry and the influx of population into cities. The oldest institute for this work was the one established by Mr. Shobi Akazawa in the city of Niigata, June, 1890. In March, 1936 there were 887 in the country, of which 135 were public establishments.

(c) Institutions for providing nutritious food. The work for providing milk was first undertaken by the Hygiene Bureau of the Home Office with the help of the city of Tokyo as an emergency measure immediately after the Earthquake of 1923, for infants whose parents were quartered in parks or other places of the city. There were 6 such organizations.

(d) Infant health clinics. The first independent organization for this kind of work was the Osaka Children's Clinic

Digitized by Google

established in 1919. In March, 1936 there were 152 such advisory institutes.

Child-Protection As for the legislation for the protection of poor children, it is provided for in the part concerning children in the Regulations for Relief of the Poor promulgated on April 2, 1929. According to the national survey made by the Bureau of Social Affairs in 1926, the number of widows and their children and children of widowers or whose parents were destitute of daily necessities was 133,588.

(a) Orphan Asylums. As was the case in Western countries, the orphanage may be said to have been one of the earliest institutions that led the Japanese toward social relief work in general. The work has made remarkable progress and is supported by the public with better understanding and large contributions. In March, 1936, there were 131 orphan asylums in the country of which only 5 were founded by public bodies. The total expenses of these asylums in 1935-36 were ¥1,087,208 for 1,710 children, chiefly met by incomes from the funds, incomes from business, subscriptions and public or private donations.

(b) Protection of weakly children. Physically weak children are cared for in recreation houses located near the sea or in the woods. The first example of this kind of work was that of the Tokyo Child-Nursing Institute which took a certain number of weakly children to the seashore of Boshu in 1900. Later, in June, 1926, the Child Protection Society, a corporation established in the compounds of the Bureau of Social Affairs, took up the work and has since provided a model example. As for the medical treatment of weakly children, the Children's Charity Hospital and the Children's Department of the Osaka Branch Hospital of the Japan Red Cross Society have been producing good results.

(c) Protection of Children of School Age. The elementary school attendance in Japan surpasses most of the nations of the world in its high rate. But there are a certain number of children who are kept from school partly through the operation of Article 33 of the Regulations for Elementary Schools, which recognizes as right in certain cases the non-attendance of children of school age, and partly because of poverty of the family. In March, 1937, the number of such children was 47,468. Encouragement of school attendance of these children, in some way or other, is made by the Government and various private bodies. Every year the Education Department gives Common Education Encouragement Grants to prefectures for the purpose of encouraging children to attend school. Owing to this help, the rate of school attendance of children in general has increased in a notable degree, and the percentage of daily attendance was 99.59 in the school year 1936-37.

The number of schools for giving poor children compulsory education and the number of those which have evening classes for the same purpose was 40 with 6,165 pupils in 1935-36. Besides these schools there were 15 nurse-maids' schools with 351 pupils, at the end of March, 1936.

The heavy depression in farm and fishing villages deprived many elementary school children of their lunch and the Government bore the expenses for their lunch for three years, from April, 1932 to March, 1935. The disbursement of the National Treasury for the purpose was ¥668,101 for 1932-33 ¥1,069,536 for 1933-34 and ¥1,481,873 for 1934-35. The number of children benefited was 425,628 in 13,865 schools during the year 1932-33, and 512,632 in 13,614 schools during the following year.

(d) Protection of Child Workers. The International Labour Conference paid great attention to this problem of protection of child workers, and its first conference, in 1919, adopted an agreement relating to the minimum age of child workers employed in industries and to child night work; at the second Conference, in 1920, an agreement relating to the minimum age of child workers at sea, was reached; and at the third Conference, in 1921, an agreement relating to child workers in agriculture was arrived at. In Japan, there had been some laws in force already, but the International Labour Conference, and recent labour conditions necessitated the revision of these laws and regulations. The legislative measures now in force for protection of child workers are the Revised Factory Law of 1923, the Minimum Age of Industrial Workers Law of 1923, the Regulations for Relief of Miners of 1926, and the Minimum Age of Seamen and Certificate of Health Law of 1923. In the Revised Factory Law Article III provides that children under 16 years of age and women shall not be employed more than 11 hours a day (exception being 15 hours for certain kinds of occupations.) Article IV prohibits their night work, and Article VII states that they shall not be employed in dangerous work. In the Minimum Age of Industrial Workers Law Article II provides that children less than 14

Digitized by Google

years of age shall not be employed in industrial work, but those children over 12 years of age who have finished the ordinary elementary school course shall be exempted from this rule. In the Regulations for Relief of Minors Article VI provides that children under 16 years of age and women shall not be employed more than 11 hours a day, and Articles XII and XIII that children under 16 years of age shall not be employed in dangerous work. In the Minimum Age of Seamen and Certificate of Health Law Article II provides that children less than 14 years of age shall not be employed, and Article III that in case of children under 18 years of age being employed a doctor's certificate of health must be obtained. Just before the enforcement of these laws, that is, at the end of 1925, there were 474 children over 10 and under 12 years of age and 6,709 children who were over 12 and under 14 years old who had not yet finished their compulsory education but were employed in industries. However, the Minimum Age of Industrial Workers Law enforced on July 1, 1926, has since prohibited their employment.

(e) Reformatory Work. In March, 1900, the Reformatory Law was enacted and the establishment of prefectural reformatories was encouraged by the Government. According to this law, however, their establishment was voluntary. In 1908, the law was revised and Prefectural authorities were compelled to found reformatories. Within two years of the enactment of the Law 30 reformatories were founded, both public and private. In August, 1917, an ordinance in regard to the founding of a national reformatory, which had been pending for many years, was promulgated, and in March, 1919, a State Reformatory, named the Musashino-Gakuin, was founded in a suburban village of Tokyo. The bills for juvenile courts and houses of correction, passed by the Diet in April, 1921, as the Juvenile Law and the House of Correction Law were revised and promulgated in May, 1933, as the Juvenile Protection Law, effective from October 1, 1934.

In March, 1936, there were 58 reformatories, with 2,841 children. The expenses amounted to ¥805,077 for 1935-36. In addition to these reformatories, there are 31 Correction Societies which are taking care of boys and girls who are not under the direct care of the reformatories.

(f) Protection of Abnormal Children. Blind and deaf-mute children are taken care of in 78 schools for the blind and 62 schools for the deaf-mute. The number of organizations for protecting feeble-minded and other mentally defective children was 9 in all, of which only one, that is, the Imamiya-Gakuen established by the City of Osaka, is a public one, and the aggregate number of inmates was 306, in March, 1936. It is estimated that there are over 5,000 such children left entirely to the ineffective care of their parents.

(g) Prevention of Maltreatment. The Law for the Prevention of Child Maltreatment, which was promulgated with Law No. 40 in April, 1933, lays down the power of prefectural governors to give adequate warning against maltreatment of children by the people who have power over them, makes provisions for putting such children under the care of suitable persons when necessary; and prohibits having such children engage in such performances as acrobatics and circuses or in infamous houses. It was put in force on October 1, 1933 and in the half year from October 1, 1933 to March 31, 1934, the number of children protected by the Law was 593; of the total 179 were those subjected to maltreatment by parents or relatives, while 414 were forced to overwork in petty shows or as street singers, geisha girls, etc.

The number of establishments for the purpose was 6 with 111 children protected in March, 1936.

Mother and Child Protection With the institution of this new law the State has taken the responsibility of assisting unsupported mothers, who are unable to educate their children on account of poverty. According to investigations made by the Social Bureau in May, 1935, there were 95,000 such mothers and children in Japan proper. Hitherto the protection of helpless mothers and children has been carried out by many public and private benevolent bodies, and under the general Relief Law. The conditions of the relief of mothers and children under the general Relief Law were as illustrated by the following table, not including other homes or dormitories for the same purpose which numbered 42 in all.

Digitized by Google

RELIEF OF MOTHERS AND CHILDREN

(Amount in yen)

Fiscal Year	Children under 13 years of age		Nursing Mothers		Total	
	Number	Relief Money	Number	Relief Money	Number	Relief Money
1932-33	63,140	1,301,395	1,352	35,571	64,492	1,337,096
1933-34	84,566	1,984,723	1,758	58,098	86,324	2,042,821
1934-35	91,946	2,052,264	999	19,445	92,945	2,071,709
1935-36	97,375	2,222,915	1,089	23,726	98,464	2,246,641

In order to make the relief of these mothers and children more complete the new Mother and Child Protection Law was passed at the 70th session of the Diet. Article 1 of the Mother and Child Protection Law states that those mothers or grandmothers who have children under 13 years of age and have to earn a living by their own effort and cannot live or bring up children because of poverty are protected in accordance with the provisions of the law.

Economic Protection

Supply and Improvement of Houses (a) Building and Management of Houses by Public Bodies. In the year 1918, to meet the pressing need for economic and sanitary housing a note was issued to encourage public bodies to build and supply houses, the building cost of which might be loaned from the Funds of the Deposits Bureau of the Finance Department. This loan together with a loan from the Reserve of the Post Office Life Insurance greatly facilitated the building work. Several other means were adopted to facilitate the work, namely, the sale of building materials produced from the Government forests at low cost, reduction in or exemption from freight charge for transportation of building materials, application of the Land Expropriation Law, if necessary, in case of buying land for the building of houses of public bodies, and freedom from the Registration and Construction Taxes.

The Government issued the Housing Association Law in April, 1921, and it was put into force the same year. Associations are to be legal persons possessing several privileges in respect of taxation, acquisition of land, etc., working funds being loaned to the associations from the Funds of the Deposits Bureau of the Finance Department through the prefectural offices. The Dojun-kai, a building corporation, established immediately after the great earthquake of 1923 with a fund of ¥10,000,000, a part of the contributions for the reconstruction of Tokyo and Yokohama, has supplied many dwellings and apartments for the people in these two cities, independent of the government measure.

The sum of low interest-rate money advanced by the Government since 1921 amounts to more than ¥135,000,000. Demands for dwelling-houses gradually decreased after 1929, and the sum advanced for the purpose has decreased accordingly. The number of dwelling-houses built under the law up to 1935 reached 83,000 (of which 6,000 were built through the Wooden Stores Construction Fund.) At the end of 1936 the number of the Building Societies was 2,813 with a membership of more than 31,620, and total sum defrayed for buildings reached ¥69,300,000.

In addition to the supply of dwelling-houses in general the Government subsidized the reconstruction of a great many houses damaged by the Great Earthquake and Fire in 1923, the earthquakes in Hyogo prefecture in 1925 and in 1927, in Izu peninsula in 1930, by the tidal waves in the north-eastern districts in 1933 and by the typhoon in the Kansai districts in 1934.

(b) Enforcement of the Insanitary Dwelling Site Improvement Law. Supply of dwellings is one aspect of this question and their improvement is another. The first step taken by the Government in the latter was to improve and remake the sites in cities where poorly built houses were crowded together. A nation-wide investigation made in June, 1925, showed that there were 217 such quarters with over 72,600 families and over 309,9000 inhabitants. The land level was generally low, the quarters naturally damp, and an intricate network of unpleasant narrow roads, together with a congestion of small but not at all compact houses lacking in proper light and ventilation, made the place an unplanned hodge-podge. For the start of their programme, the Government, taking up a plan to remake such quarters existing in the six largest cities (Tokyo, Osaka, Nagoya, Kyoto, Kobé and Yokohama) and in the rural districts contiguous to them, enacted in March, 1927, the Insanitary

Digitized by Google

Dwelling Site Improvement Law which was enforeced in the same year. Subsidies granted to local governments from the national treasury for this purpose amounted to ¥3,200,000 in 1927–1935. The work is to be continued till 1943 with a subsidy amounting to ¥1,707,685.

Public Lodgings Single working men, unemployed persons and the like, as a rule, sleep in imperfectly-equipped doss-houses or cheap lodgings, or live with others. In 1925, there were 8,873 doss-houses with 92,861 monthly sojourners who had families, 200,518 single persons and 208,775 one-night lodgers, amounting to 502,154 persons in all. This situation was not at all desirable viewed from any angle, and the preparation of cheap yet healthy public lodging-houses seemed an urgent need for the welfare of labourers and the like. The number of such lodgings in March, 1936, was 155, with 3,686,593 one-night lodgers in 1935-36. Of the total number of lodgings 67 were free, the rest charging 10, 15 or 20 sen a night.

Public Markets The public markets are retail markets managed by public bodies or public welfare organizations having as their aim a cheap supply of food-stuffs and other daily necessaries. According to the investigation made in November, 1921, by the Bureau of Social Affairs, the average cost of food-stuffs of the poor families in the city of Tokyo was 54.7% of their total living expenses. In August, 1918 a rice riot, which was started by the poor housewives at a small village of Toyama prefecture, spread over the country like a prairie fire. The situation awakened Imperial solicitude, and ¥3,000,000 was granted for relief from the Privy Purse. The Government also provided ¥10,000,000, and the amount of contributions by wealthy men and benevolent persons reached ¥25,000,000. This money was used in giving rice to the poor in the country and in opening establishments where rice was sold at lower prices. In December of the same year, the Government issued a note encouraging the establishment of public markets, and made loans available at a low rate of interest for the necessary expenses in establishing such markets. In March, 1936, there were 278 such markets opened in all prefectures but 6, and sales for the fiscal year 1935-36 amounted to ¥54,354,432.

Lunch Rooms The object of the people's lunch rooms, whether attached to a public lodging-house or independent, is to provide labourers, small-salaried men and the like with simple, wholesome and sanitary meals at cheap rates. In March, 1936, there were 70 of these people's lunch rooms, most of them managed by public bodies and located in cities and towns, with 10,246,608 meals taken in 1935-36. Each meal cost from 12 to 20 sen.

Public Baths Japanese people greatly enjoy their baths, but only a small proportion of them can afford private baths. The majority have to utilize public baths. Moreover, it is not very infrequently the case that people take fewer baths than they require as the bath-charges are not low enough. Herein lies the need of sanitary, well-equipped, cheap or free public baths. The number of public baths in March, 1936, was 170, patronized by 19,421,047 bathers in a year.

Public Pawnshops The pawnshop and the money-lender are utilized by people of small means as a simple and popular means of monetary circulation. The Public Pawnshop Law, promulgated in 1927, regulated managing bodies subsidies of 50 per cent of equipment expenses from the national treasury, loans, computation of interest and term of pledge. The present financial depression throughout the urban and rural districts has caused unprecedented tightness of money among the salaried men, labourers and farmers of smaller means, and the need for public pawnshops has become more acute. The estimated amount of subsidies for the public pawnshops for 1937–38 is ¥90,000.

The number of public pawnshops which was only 71 at the time of the enactment of the Public Pawnshop Law, has increased every year since and reached 1,091, at the end of April, 1936. Since the economic crisis of 1932, money has become tight in the rural districts, so that the Government has been making special efforts to establish pawnshops in those districts.

However, when the above mentioned number of public pawnshops is compared with that of private pawnshops which numbered 12,700 at the end of 1934, the former is still lagging far behind. In view of this the Government is determined to make further efforts for their establishment.

In examining the number of people who are benefiting from the use of pawnshops, classified according to the kinds of occupation, we find labourers are greatest, followed by small retailers, small-scale manufacturers, farmers, salaried men and fishermen in the order named. It will be specially noted that the member of fishermen and farmers has increased conspicuously since 1932.

Protection of Unemployed

Employment Exchanges There have been from olden times private employment exchanges called "Keian" or "Kuchitreya" conducted by individuals. But there were no free exchanges until 1901, when in Hongo Ward of the city of Tokyo there was established a free lodging-house for low class labourers and the unemployed, and along with this charitable work the first private free employment exchange was founded for the lodgers in 1906. The earliest public employment exchanges were established in Tokyo in 1911. At the close of the Great War the Home Office felt the urgent necessity of extending and developing the employment exchanges in order to meet the needs of the time. In 1920, the Office put into circulation a low interest loan for the establishment of employment exchanges to cope with the demands caused by an extreme business depression. And in June of the same year, the Home Office, in order to systematize the work of employment exchanges, took charge of all the affairs relating to them, and in order to extend, unite and develop them, allowed the Kyocho-kai to start a central managing office of all the employment exchanges in the country.

(a) Employment Exchange Law. Complying with the general demand, the Employment Exchange Law was issued in 1921. According to this Act, employment exchanges are, in principle, public organizations. They are voluntarily established and conducted by the heads of cities or towns, but in some instances the Home Minister gives orders for their establishment in places where he thinks the conditions demand them. The National Government subsidizes them to the extent of one-half of the expenses for buildings and equipment at the beginning, and one-sixth or less of other expenses. One Central and several Local Employment Exchange Bureaux have been founded for the employment exchanges in the country, and the work is under the supervision of the Home Minister and the Directors of these Bureaux. A standing committee is established to direct the management of the exchanges. There may also be established private free employment exchanges with the permission of the administrative authorities, and the aid afforded by all these employment exchanges must be free of charge.

After the enforcement of this Law, in November, 1922, the convention relating to unemployment, adopted by the First International Labour Conference at Washington, was ratified and published for the encouragement of this kind of work. In addition to the provision above mentioned, the Regulations for Enforcement of the Employment Exchange Law were revised, in 1924, in order to systematize the conections among employment exchanges, and there were also newly-introduced regulations for the establishment of seasonal-employment exchanges, and of employment exchange committees in cities and towns for the promotion of this work. It is true that there are still a great many employment exchanges run for profit, but owing to the increase and improv-

Digitized by Google

ment of public employment exchanges they are gradually decreasing. And to conform with a resolution adopted at the Washington Conference of 1919, the National Government enforced from the 1st of January, 1927, Regulations for the Control of Employment Exchanges for Profit.

In 1936 an improvement was made in the administrative organization concerning employment exchange and a subsidy was granted, as a piece of relief work, for the establishment of facilities for training the unemployed.

In view of the results obtained so far since the enactment of the laws in connection with employment exchanges the Revised Employment Exchange Law was presented to and passed at the 69th Session of the Diet in 1936, and put in force as from September of the same year.

Important points of the revision are as follows: (1) According to the old system co-ordination, control and supervision of the work was in the hands of the central and local employment exchange bureaux, seven in all, but this has now been transferred to the Home Minister and prefectural governors. Under the old system the director of the Employment Exchange Bureau had the supervising power on employment exchange business alone, but did not possess the authority in general over cities, towns and villages which are the principal managing bodies of labour exchanges, so his activity was very limited. On the other hand emergency work for the relief of the unemployed, industrial training or handicraft directing work, supervision of employment agencies run for profit, supervision of recruiting labourers, and emigration which are directly connected with employment exchange work, were under the supervision of the prefectural governors, it was therefore thought advisable to transfer the supervision of employment exchanges to the prefectural governors, and thereby develop the work of employment exchanges in co-ordination with the affiliated works just mentioned.

(2) In the past, the principal managing bodies have been, as a rule, cities, towns and villages. But the new Act has made it possible for prefectures to act in that capacity, thus doing away with any financial difficulty and making the selection of suitable locations for the employment exchange offices easier and better for further promotion of the work in all parts of the country.

(3) The revised Act makes those who intend to employ labourers en masse notify prefectural governors as to the items necessary for employment. This has been an entirely new addition, and is intended to enable prefectural governors to have ready knowledge as to the demands on labour. This provision applies to an employer who intends to employ more than 30 labourers at one time and makes him advise prefectural governors as to the sex, kinds of industry and the number of labourers required.

It is proposed, however, that since the employment exchanges are nation-wide they should come under the direct control of the State, and in the 69th session of the Diet the House of Peers passed the Revised Employment Exchange Law with an additional clause of request for the State control of the work. The question remains for future study.

Conditions of the Work The number of employment exchanges which was 135 in 1923 when the Employment Exchange Bureau was established had increased to 693 at the end of 1936, of which exchanges specially for day-labourers numbered 62, for female labourers 8, for boys and girls 2, for the intelligentsia 1, and for Koreans 4.

The employment exchanges which succeeded in finding jobs for more than 310,000 people, excluding day-labourers, in 1923 were able to increase the number to 966,141 in 1937.

Day-labourers got 1,090,000 working days in 1923, through employment exchanges, this was increased to 16,770,000 working days in 1933. In 1934 and 1935 the number decreased but they were still considerable. The business conditions of employment exchanges are as shown in the following table:

EMPLOYMENT EXCHANGE

	1923	1926	1929	1933	1935	1936	1937
General							
Situations vacant	817,427	729,720	720,521	1,451,998	1,917,983	2,297,211	2,804,162
Situations sought	720,438	780,615	882,491	1,528,291	1,679,568	1,778,145	2,092,348
Situations filled	312,550	222,563	263,669	663,315	741,642	812,327	966,141
Day-labourers							
Men wanted	1,158,134	2,522,177	3,015,195	16,897,143	12,988,711	12,561,136	10,595,992

Digitized by Google

	1923	1926	1929	1933	1935	1936	1937
Jobs wanted	1,318,648	2,793,384	3,473,237	20,124,272	14,463,730	13,666,837	11,102,930
Day's work secured	1,091,047	2,477,746	3,010,280	16,779,159	12,867,295	12,270,660	10,196,061

Note: The table does not include private profitable employment exchanges the number of which was 2,010. The number of men wanted was 1,014,303, jobs wanted 645,844 and works secured through them 514,709 in 1937.

For ex-soldiers the exchanges got 7,600 positions in 1935, an increase of 3,000 as compared with the number in 1934. In the introduction of juvenile workers, about 48,000 boys and girls who graduated from primary schools in March of 1936 were successfully placed by May of the same year, showing an increase of about 5,000 over the preceding year, and of young people under 18 years of age 158,000 were placed in 1936.

As to the conditions of employment agencies which are run for profit, the number of which reached 10,000 in 1923 when the Employment Exchange Bureau was established, was reduced to 3,300 with the enforcement in 1927 of the regulations on the supervision of the employment agency business, and at the end of 1937, the number has been further reduced to 2,010. The number of persons who avail themselves of these agencies is about 1,000,000 per year and the number of those who succeed in securing positions is about 500,000, but this number also is declining. According to the figures obtained during the last three years, the number of persons who called on these private agencies was 740,000 in 1935, 713,411 in 1936, and 645,844 in 1937.

Labourers from the Country Farmers in rural districts emigrate to cities in the intervals of farming, mostly in winter time when the farms are snow-bound. According to the investigations conducted by the Central Employment Exchange Bureau, there are about 1,000,000 such emigrants every year throughout the country, of which about 150,000 or so get jobs through the good offices of employment exchanges. The way of finding work for these emigrants and their protection has been a question for many years, and the State has taken measures to supervise the private employment agencies, while the public employment exchanges do all in their power to find them employment and give them protection. Moreover, the establishment of associations for the protection of these emigrants are encouraged, and travelling expenses are advanced for penniless ones. For the young boys and girls of the 6 north-eastern prefectures who are sent to cities and factories to help their families special officials are appointed in villages to guide their employment and protect them from falling into bad hands.

Study of Adaptability of Labour for Employment At present only 8 categories of adaptability for employment are standardized in Japan while at least 90 analyses are needed to meet the requirements of the times. Experts on the examination of adaptability are appointed in the Social Bureau, Ministry of Home Affairs, to accomplish such analyses and train employment exchange officials in their task.

Conditions of Unemployment The Social Bureau has been kept informed of unemployment conditions through reports issued by the prefectural departments on the first of every month since 1929. According to these reports, the number of unemployed in January 1930 was 346,000, after that it increased month by month without a break up to September, 1932, when it reached 506,000. Since the end of 1932, owing to relief work and the turn for the better in the munition and export goods industries, the number has gradually decreased. It was 463,000 in December, 1932, 365,000 in September, 1934, 346,000 in September, 1935, 330,000 in September, 1936, and 271,874 in January, 1938.

Comparing the number of people dismissed with those taken on in factories and mines employing more than 50 persons the number of newly employed labourers has exceeded the number of dismissals since the latter half of 1932. The number of labourers was 1,610,000 in factories, 262,000 in mines, and 161,000 in Government mills at the end of July, 1936, which, as compared with the figures of the same month of the preceding year, showed an increase of 125,000, 31,000 and 3,000 respectively.

Emergency Enterprises for the Unemployed. Among the measures taken for the relief of unemployment, the civil engineering work begun in 1925 was the most important. Among others, the establishment of Business Training Institutes for the unemployed began in 1936.

The civil engineering work was first undertaken by public bodies affiliated with the 6 largest cities in the country, the bodies and scope of the work have since gradually widened. The Government has, also, since 1932, directly been

Digitized by Google

undertaking civil engineering work, reclamation work, the adjustment of farm-lands, munition industries, etc., and has been encouraging large cities where unemployed labourers swarm, to increase enterprises for their relief by granting subsidies or advancing money at low rates of interest. Since 1929 the relief of the low-salaried class has been carried out in the 6 largest cities, and prefectures in which they are located, by giving them work on statistics, investigations, or adjustment of written matters or documents, one-half of the expenses being borne by the State. In the next table a summary of the relief work conducted in the last 4 years is given:

Unemployment Relief Enterprises in 1933–1936

(Subsidized ones only)

Fiscal Year	Kinds of Enterprises	Expenses in Yen	Wages in Yen	Aggregate number of work-days
1933-34	Enterprises for ordinary labourers	34,882,642	12,053,138	9,157,047
	For low salaried class	1,803,635	1,662,208	1,369,509
	Total	36,686,277	13,715,346	10,526,556
1934-35	Enterprises for ordinary labourers	22,890,537	6,750,623	5,157,600
	For low salaried class	1,537,267	1,417,195	1,150,352
	Total	24,427,804	8,167,818	6,307,952
1935-36	Enterprises for ordinary labourers	15,378,527	4,710,145	3,472,024

Poor Relief

General Poor Relief The Regulations for Relief of the Poor were promulgated as early as 1874. The revised Relief Law was promulgated on April 2, 1924 and was put in force on January 1, 1932. The regulations maintain the old spirit of mutual help among relatives and neighbours and, at the same time, emphasize social solidarism and public responsibility of relieving impoverished people. Those who are relieved by the law are old poor people above 65, helpless juveniles under 13, pregnant poor women, helpless invalids and cripples, those who are handicapped by sickness, wounds or mental disorders, and poor mothers who are nursing infants under one year of age.

The period of relief should generally be for as long as it is required, but sometimes, especially when the case is taken up by a Block Committee, it is fixed, for example, at three or four weeks. The method of relief is of two kinds, indoor and outdoor, and as for the former, such large cities as Tokyo or Yokohama have their own homes or other relief institutions, otherwise the smaller municipalities entrust the relief of the poor to those orphanages, asylums or charity hospitals which are managed by private persons or organizations.

The results of the operation of this Act since 1932 are given in the following table:

RESULTS OF RELIEF WORK

(Units 1,000 people and ¥1,000)

Kinds of relief	1932	1933	1934	1935	1936
Living cost:					
(1) Number of the relieved	39.7	176.8	185.9	166.7	190.0
(2) Expenses defrayed	3,169.6	4,548.1	5,055.9	4,577.3	5,414.2
Medical treatment:					
(1) Number of persons	15.1	33.1	34.7	49.6	32.9
(2) Expenses defrayed	420.2	608.4	738.6	1,288.3	757.2
Maternity cases:					
(1) Number of women	2.3	3.2	2.4	2.3	1.5
(2) Expenses defrayed	13.4	14.8	11.1	12.9	7.0
Help for working:					
(1) Number of Persons	0.4	0.4	0.5	0.9	0.4
(2) Expenses defrayed	4.7	5.0	4.7	15.8	4.6
Total					
(1) Persons	157.6	213.5	223.5	219.7	225.0
(2) Expenses defrayed	3,607.9	5,176.2	5,810.3	5,894.5	6,183.1

The economic difficulties which many towns and villages have been experiencing in recent years have weakened their financial strength and increased the number of persons who need relief. Accordingly the burden which was imposed on towns and villages in the ratio of 2-1-1 on city, town and village, became too heavy for them, and was an obstacle to the efficient operation of the law. The ratio has therefore been changed to 7-3-2, by the revised Relief Law.

Special Poor Relief Special poor relief, as against general poor relief, includes (1) Proper attention for those found sick, dying or dead by the roadside, (2) Relief of sufferers from natural calamities, and (3) Relief of impoverished soldiers and their bereaved families.

Regulations now in force, issued in 1899, aim at relieving those people who are found sick on the road, the disposal of dead bodies, and care of the children who are with them. The heads of the cities or towns where they are found must apply to the prefectures concerned for authority to take charge of them in case there are no relations on whom they can depend. The expenses for their relief, if not met by those who are relieved themselves or their supporters, must be defrayed by the prefectures concerned, and they may be handed over to public or private institutions for further help. There is no limit of time fixed for their relief. In 1935-36, there were 7,985 persons found sick with the money expended for their care amounting to ¥654,642, and 4,522 deaths cared for with an expenditure of ¥58,765.

Calamity Relief Japan suffers particularly from natural calamities ow-

Digitized by Google

ing to its climate and volcanic activities. Losses from fires and floods alone amount to nearly ¥70,000,000 every year. To relieve the sufferers from these calamities, the Natural Calamities Relief Fund Law and Sea Disaster Relief Fund Law were passed in 1899.

Previous to this date the Central Government in co-operation with the prefectural authorities had been working under the Biko Chochiku Law of 1880, according to which ¥1,200,000 had been paid out of the National Treasury each year, and further appropriations made from public saving funds. Consequently, the total of the funds both of the Central Government and Prefectures had been enormous.

At the end of April, 1935, the total amount of the funds was ¥91,496,777, a decrease when compared with the preceding year. The reason was the unusual disbursements for relief in 1934–35 amounting to ¥3,671,388. Besides the special donation from the Imperial House which amounted to over ¥53,000 for sufferers in prefectures, the public contributed ¥7,640,075 through the Social Bureau in that year.

In March, 1937, the total of the Natural Calamities Relief Fund amounted to ¥89,504,972, and, if Okinawa prefecture and Hokkaido were excepted, the average fund for each prefecture reached ¥1,980,000. Though particular items for which the fund is expended differ and change according to the nature of calamities, the largest amount of the fund is expended on food, shelters, and for business funds. The money expended for the relief amounted to ¥3,716,071 in 1934, ¥753,211 in 1935 and ¥25,926 in 1936.

With the sad experience at the time of the Great Earthquake of 1923 fresh in the public memory, Osaka and Kyoto introduced the Great Calamities' Relief Regulations soon after that terrible event, according to which the Prefectural Offices, the Municipal Offices, the Army Division, and the Gendarmerie Corps are to co-operate in cases of great emergency.

The annual number of marine disasters off the coasts of Japan is over 1,000, and the average number of persons killed, injured or missing in these disasters reaches 600 or 700 a year. For the relief of these persons, the Sea Disaster Relief Law was issued in 1899, by the terms of which the heads of municipalities are invested with certain powers to give relief at the expense of the captain or owner of the ship concerned, but in case the money is not refunded by the captain or owner, or the relief proves insufficient, the expense incurred is paid by the National Government.

The Revision of the Military Relief Act The Military Relief Act has been in force since January of 1918, a part of it being revised in March, 1931. It aims to give relief at State expense to those non-commissioned officers and men who are injured or suffer illness in war or during their term of service, and are, on that account, dismissed from the services, or to their families or the bereaved; to the families of soldiers and sailors who are called up for service; and to the bereaved of those soldiers and sailors who die of injuries or during their service if they find it difficult to get a living.

The relief, given under this Act, has greatly increased in recent years owing to the economic depression, the effects of the Manchurian Campaign and because of a better understanding of the purpose of the Law. In 1934–35 the number of people who received relief reached 105,772 persons or 31,996 families, the amount expended being more than ¥2,800,000. In 1935–36 the original estimate for relief was ¥2,074,000, but ¥867,000 was added later.

The purpose of the revision of the Act was to extend its sphere, and to ameliorate the conditions or qualifications, under which relief is given, so that the young men who serve in the army or navy may discharge their duties without worry about their families.

The China Affair in 1937 and 1938 is going to demand a more active operation of the Military Relief Act for the increased number of people who need the application of the Act.

MILITARY RELIEF 1930–1937

	Number of Persons Relieved	Amount (In yen)
1930–31	51,856	1,586,695
1931–32	71,643	1,731,614
1932–33	99,023	2,427,496
1933–34	98,905	2,702,935
1934–35	105,772	2,809,248
1935–36	111,533	2,897,665
1936–37	117,943	2,968,839

Private Military Relief The organizations for private military relief work numbered 31 at the end of March 1929, the Japan Red Cross Society and the Imperial Military Aid Society being the most prominent. The organizations are mainly engaged in the giving of relief, generally temporary, to those who are outside the application of the Military Relief Law.

Health Protection

From very long ago, the Imperial Household has paid attention to the care of the sick. Hospitals for the Poor were established in 593, by Prince Shotoku. The present Saisei-Kai, a foundational juridical person, established by the wish of the Emperor Meiji to give medical treatment to the poor, continues the work of these ancient hospitals.

Free Medical Treatment There are many organizations which give free medical treatment, hospitals, medical consultation offices, visiting treatment societies, visiting nursing societies, etc. The Government decided to extend the work to farm-villages and fishing communities with ¥6,000,000, a part of which was donated by the Imperial House. There were 169 public hospitals and 410 smaller branch hospitals or medical clinics, according to the statistics of 1935-36. The number of private medical relief facilities in the same year was 494. The cases treated numbered 1,825,626.

Cost-Price Treatment The Emperor Meiji pointed out, in his edict, that Japan, in general with the rest of the world, was suffering great hardships and that it was most regrettable to see faithful but poor subjects suffering from illness unable to get medical treatment, and that there was acute need to give suitable relief to them; and, as elsewhere mentioned, he donated a large sum of money for this purpose.

The thing most dreaded by the labouring classes is sickness or injury. Once smitten by sickness or rendered idle by injury a workman is thrown out of work, no matter how much he may desire it, and has no means of getting medical treatment; his days of unemployment may be prolonged, and finally he may be stripped of all his possessions and his family may starve.

The Cost-Price Medical Treatment Association, a corporate juridical person, was organized on the 5th September, 1911 by the effort of Mr. Suzuki and Dr. Kato.

The Association has its headquarters in Tokyo and four branch offices in Tokyo, Yokohama, and Osaka and there are now 41 cost-price medical treatment offices established by public bodies in different parts of Japan, and 112 hospitals in which the working-class patients are treated at cost-price.

The Do-ai (mutual love) Hospitals in Tokyo and Yokohama, the Imperial Charity Association, the Red Cross Hospital, the Jikei (benevolence) Association Hospital have recently begun cheap medical treatment. The Do-ai Hospitals in Tokyo and Yokohama were established with the money given by the American people at the time of the Great Earthquake, 1923, as a memorial of their kind assistance in that period of trial. Mr. Suzuki, who has played a brilliant part in the promotion of this kind of social work, is now insisting upon the national management of all medical business for the thorough protection of the life of the people in view of the unreasonably high cost of medical treatment by common practitioners and consequent loss of life and impoverishment.

Sanatoria, Asylums and Special Hospitals There is to be found a regulation concerning mental disease in the Taiho Laws issued in 701. But the number of sufferers increased in direct proportion to the advancement of civilization. Statistics record the fact that at the end of 1912 there were 32,964 insane persons, by the end of 1922 the figure had risen to 50,891, and in March, 1937 it stood at 86,047, an increase of 2,682 as compared with the preceding year, the ratio being 12.25 in every 10,000 of the population, an increase of 0.21 as compared with the preceding year.

(a) Laws and regulations concerning insane persons. The Law for the Custody of Insane Persons was enacted in 1900, with the object of protecting the public from harm at their hands. It provides for the appointment of a responsible person to take an insane person under his custody, and if necessary, by the approval of the prefectural governor, to confine the said insane person. The expenses, according to this law, shall be borne by the estate of the insane persons or by responsible persons, as the case may be, and in case any insane person protected by the order of the head of a municipality is unable to reimburse the money advanced by the municipality, the prefecture shall bear the expenses.

The Insane Asylums Law, which may be taken as a sub-division of the previous one, gives power to the competent Minister to order and bring prefectures, if necessary, under obligation to establish insane asylums or hospitals (Art. 1), and makes provisions concerning the State subsidy.

(b) Present condition of insane asylums and hospitals. At the end of March, 1936 there were 6 public hospitals for the insane and 46 private asylums. There were 9,792 inpatients in these hospitals and asylums.

(c) Tuberculosis. It is almost impossible to get the exact number of cases

Digitized by Google

of tuberculosis in this country, but the ratio of patients per 1,000 of the examined in accordance with the provisions of the Law for the Prevention of Tuberculosis was 0.26, a decrease of 0.05 as compared with the previous year. In 1936, 107,157 died from pulmonary tuberculosis, that is 87.1 in every 1,000 deaths, the highest ratio for five years. The Government issued regulations in 1914 for the establishment of tuberculosis sanatoria in cities of more than 30,000 population, and regulated the State subsidy thereto. The present Tuberculosis Prevention Law was enacted in 1919. In 1935-36 there were 36 sanatoria with 9,215 patients. In 1939, H. I. M. the Empress donated a large sum of money for the relief of the patients.

(d) Leprosy. For the prevention of leprosy, the Leprosy Prevention Law was issued in 1908. By this law, aid for indigent lepers out of public funds, the order of the competent Minister for the establishment of leper-asylums by united prefectures, or the use of private ones in lieu of public ones and other such matters are provided for. The whole country, in conformity with this law, was divided into five Divisions. Besides 9 public leper-asylums, there are 8 private ones. The Koyama Fukusei In, established by the Roman Catholic Church in Shizuoka prefecture, the Ihai En in Tokyo prefecture, the famous Kumamoto Kaishun Byoin founded by an English lady, Miss Riddell, and the Tairo In in Kumamoto prefecture have done valuable work for many years, being managed by Christian missionaries. In 1930, H. I. M. the Empress Dowager donated a large sum of money for the work. In 1935-36, there were 18 leper-asylums, 4 of which established by the Government and 5 by public bodies, with 6,659 patients. (See Chapter XXXII on these subjects.)

New Social Measures

The Store Law

Legislation regulating the business hours of stores, particularly small stores, has long been under consideration in Japan. The Store Law now in effect was approved as presented at the 73rd session of the Imperial Diet (1938) and issued as Law No. 28 on March 26th. With the promulgation on August 31st of Imperial Ordinance No. 618 concerning the date of enforcement of

Digitized by Google

the Store Law, it came into force on October 1st.

Purpose of the Law The primary purpose of the Store Law is to promote health and hygienic conditions in employees of stores.

Examination of the actual conditions prevailing in the operation of stores in Japan reveals that business hours are uselessly long and irregular, as such matters are left entirely in the hands of proprietors. The closing time in numerous cases is later than 11 o'clock or even 12 o'clock at night. The closing time of department stores is fixed under the Department Store Law, while that of restaurants and other eating places is restricted by police regulations. However, there has been no law restricting business hours or fixing the closing time for stores in general from the standpoint of protecting employees, although certain voluntary restrictions exist under agreements reached by commercial organizations. These voluntary agreements have not been operating satisfactorily in most business enterprises with the exception of barber shops. Elsewhere, long working hours are subjecting store employees to overexertion and are seriously affecting their health.

Results of the recent physical examination for conscription show that men employed in business have inferior physiques to those in other occupations. Among those rated as first-grade conscripts, for example, men engaged in fishing occupied the predominant position, followed by those engaged in mining, transportation, agriculture, manufacturing industries and commerce. Among those who were classed as third-grade conscripts, men employed in commerce outnumbered the others. These facts indicate conspicuously that men employed in stores have very poor physiques.

The secondary purpose of the Store Law is to give store employees an opportunity for self-culture, study and training. Under present working conditions, employees have little time for study and mental development; they are too often denied the opportunity of becoming trained businessmen. This state of affairs is not only unfortunate for the employees themselves, but it constitutes serious losses to the proprietors of stores as well. The nation suffers too, inasmuch as many promising youths are not given chances to grow in usefulness.

With the enforcement of the Store Law, employees will have a little spare time in the evenings and those interested will be able to utilize holidays to improve and train themselves. If thoughtful proprietors of shops and business leaders take the opportunity created by the enactment of the present law to direct more positive efforts toward the betterment of treatment of their employees and set up cultural institutions and measures designed to raise their physical standard, it will mean that the Store Law has laid a foundation for important improvements in social welfare.

Thirdly, it may be pointed out that to restrict adequately the present uselessly long and irregular business hours is to economize in operating expenses and to rationalize the management of stores. In the case of restaurants and other eating houses, there may be a considerable volume of business even after 10 o'clock at night, but in the case of ordinary stores or barber shops, business would be trifling after this hour. Basically, the total volume of purchases by consumers in a city has certain limits; it fluctuates little according to early or late closings. In general, late closing times cause a reduction in the ratio of business profits to operating expenses. In other words, by closing stores late at night, proprietors sacrifice themselves for the benefit of casual customers.

An official survey conducted in this connection some years ago in the busiest sections of representative cities throughout the country—sections that thrive particularly on evening business—showed that the number of customers after 10 o'clock was but 5.2 per cent of the total for the day; proceeds of sales after 10 o'clock amounted to only 3.5 per cent of the day's business.

There are many cases in which leading stores have been able to rationalize their management and to increase their sales by closing their establishments earlier at night. Regulation of closing times by law would rather be beneficial to stores, enabling them to economize in electric light charges, fuel and diverse other items, since there is no fear that the legal restrictions would cause unfair competition from other stores. Some proprietors advocated the promulgation of such regulations long ago, not simply for the protection of their employees, but because they expected to rationalize their business under these conditions.

Substance of the Law The Store Law consists of 18 Articles. It provides rules governing the closing time and holidays, special rules regarding large stores, rules protecting the health of employees

Digitized by Google

and prevention of injuries, rules governing store management and penalty provisions.

1. The Scope of Application (Articles 1 and 17)

In view of the fact that restriction of business hours is required mainly in cities, this law is applied to cities. When the Minister of Welfare considers it necessary to prevent injustice to city stores and unfair competition by town and village stores against city stores, the law may be made applicable to towns and villages adjoining cities. The Government has no intention for the time being of applying the law to other rural communities.

The Store Law is applied to merchandise sales businesses, barber shops, hair dressers and beauty parlours. The merchandise sales business includes wholesale and retail stores, but restaurants and other eating places are excluded by virtue of an Imperial Ordinance. From the standpoint of protection of employees, the law should be applied to restaurants, but the Government has decided to exempt these for the present because it is extremely difficult to restrict their business hours in a manner similar to that of other businesses, in view of the peculiar conditions under which they are operated. Special legislation here is being contemplated.

Article 1 of the present law provides that the law is applicable to merchandise sales businesses, barber shops, hair dressers and beauty parlours run for profit. However, Article 17 provides that the law is applicable as well to all such enterprises operated by cities, towns, villages, cooperative industrial societies and cooperative consumers societies on a non-profit making basis. From the point of view of protection of employees, there is no reason for the latter to be exempted.

2. Regulation on Closing Time (Articles 2, 3 and 4)

Working hours must be restricted. However, due consideration must be given to the fact that stores are operated to attract customers, and it is extremely difficult for them to accomplish business purposes within strictly limited hours of operation under the circumstances prevailing in Japan. The present law, therefore, regulates only the closing time and but indirectly restricts the workig hours of employees, leaving this latter problem for future solution.

The law in principle fixes the closing hour at 10 o'clock at night. It prohibits sales of merchandise, hair cutting, hair dressing and beauty parlour services afer that time.

A few exceptions are recognized. For instance, the law permits sales and services for customers who enter stores before the closing hour and remain. The law also allows sales of merchandise after closing time to customers who wish to buy articles for emergency purposes.

For districts where business thrives especially during the evening and where it is extremely difficult for stores to close at 10 o'clock, prefectural governors (Metropolitan Police Headquarters in Tokyo) are authorized to extend the closing time to 11 o'clock within certain limited areas. In designating such special areas, decisions are to be made after consulting chambers of commerce and industry or other organizations within the involved districts, in accordance with prescribed rules. Again, during periods of unusual business activity—year-end, new year, mid-summer gift season, holidays, etc.—prefectural governors, when deemed necessary, may extend the closing time or suspend the application of the rules governing the closing time within limited areas and periods of time, all not to exceed 60 days throughout the year.

3. Holidays (Article 5)

The Store Law provides that proprietors of stores must give at least one holiday a month to their employees. It is not necessary to close the stores, although it is considered best to adopt such a system giving complete holidays once a month to employees. In certain lines regular monthly holidays are already established. Yet, under prevailing conditions, it is difficult to enforce a rigid holiday system through legal measures and the Government has avoided it accordingly.

4. Exemption of Stores in Special Districts (Article 6)

Stores attached to amusement enterprises, exhibitions, expositions, piers or other similar places where it is impossible to close shop at 10 o'clock may be exempted from the provisions of the law with the permission of prefectural governors. Temporary enterprises such as exhibitions and expositions are exempted from the application of the provisions on holidays, provided that the enterprises have been approved by the prefectural governors.

5. Working Hours and Holidays of Large Stores (Articles 7 and 8)

The business of large commercial establishments is conducted systematically. There is no reason why they should be treated differently from factories that come under the Factory Law which

Digitized by Google

provides the limits of working hours and holidays for minor workers under the age of 16 and female operatives. The Store Law provides, therefore, that large commercial establishments where 50 or more persons are employed regularly are required, as under the Factory Law, to limit the working hours for female and minor employees under the age of 16 to less than 11 hours a day, including 20 minutes rest time to the hour. The law also requires that such employees be given two or more holidays a month.

Large commercial establishments may extend the maximum working hours, as in the case of stores in general, in busy times on the approval of prefectural governors. Such times are limited to 60 days within the year. Large establishments may further extend working hours beyond this 60-day period in cases of extraordinary necessity, on approval of the authorities. Similarly, the number of holidays may be cut to one a month in unusually busy seasons.

6. Promotion of Health and Prevention of Casualties (Article 9)

The Store Law authorizes prefectural governors to issue various orders regarding the prevention of injuries and the promotion of health at all times advisable. The law specifically requires the proprietors of stores with 50 or more employees to provide at least one bench for every three female employees whose work requires them to remain standing over long periods.

7. Street-stalls and Shops on Ships and Trains

The present law is not applied to stores on trains, steamships and other transportation services. Nor does it apply to street-stalls. However, it authorizes prefectural governors to fix the closing time for the latter, since it is possible to cause unfair competition between general stores and street-stalls if the latter are permitted to engage in unrestricted business while the former are required to close at 10 o'clock.

Legislation protecting workers is not new in Japan. Various laws such as the Factory Law, the Mining Enterprises Law, the Law Governing the Minimum Age of Workers and the Health Insurance Law have long been in force. However, there have been no legal measures protecting employees in commercial establishments. The Store Law is indeed the forerunner in its kind, and its importance is to be found in the fact that the Government has established a basis for the systematic protection of commercial employees.

The number of store employees who receive protection under this law is approximately 1,400,000. The Store Law is applicable to proprietors of stores and their employees only. It imposes no legal obligations on third parties. The law is certain to have far-reaching consequences to society in that it prohibits sales or services to customers after 10 o'clock at night.

Measures Assisting Changes in Occupation

A result of the enforcement of the plan for mobilization of materials has been that considerable numbers of merchants and manufacturers have been forced to suspend or close their businesses, or to curtail business operations. This plan was put into operation in connection with the China Affair and was aimed at securing speedy and adequate manufacture of war supplies and at balancing the country's international accounts through restriction of imports and expansion of exports. Under the plan, strict economy is enjoined on all internal consumption of goods. Should the plight of those affected be left unremedied, the plan might defeat its own purpose by impairing the stability of national life and the nation's economic strength.

Aware of this possible danger, the competent authorities have determined to take the necessary measures to enable such industrialists and tradespeople to tide over the emergency by entering war-supplies industries and such other trades as are calculated to remove anxiety and unrest from these people, their families and employees.

Problems affecting industry and trade will be taken by the Department of Commerce and Industry. Those pertaining to employees and workers will be handled by the Department of Welfare.

The ordinance of the Department of Commerce and Industry of September 21, 1938, provides for the creation in that Department of a temporary Bureau specially devoted to the study of the problem of changes of trade. Officers to take charge of this work are to be specially appointed and attached to all the prefectural offices. These officers, in close touch with the Central Government, will render concerted efforts to facilitate the changes of business. To finance this work, the Government has made an appropriation out of its reserves for the sum of ¥3,410,000.

Principles The basic idea of all measures for ensuring changes in occupations is to minimize the sacrifices that may be entailed in the operation of the

Digitized by Google

plan for mobilization of materials and to enable persons to continue in existing businesses. Where, however, this is not feasible, all reasonable assistance will be given them to effect the necessary changes. Changes in occupations must be made in one of the following three drections: (a) war supplies industries; (b) export goods industries; (c) substitute goods industries where raw materials are obtainable within Japan.

As to the manner of procedure of the present work, while it is important to ascertain the technical ability of each individual and the condition of his equipment, the measures to be applied should be worked out rationally and systematically. In the actual work to be undertaken, full use should be made of the associations of small- and medium-sized industrialists and merchants already in existence. Where people are without such an organization, they should be induced to form one and receive guidance so as to be able to effect changes of occupations in a rational manner.

Remedial Measures The measures to be pursued by the Bureau in charge of the work, mentioned above, lie along the following lines:

(1) To ensure readjustment in the distribution of orders centring in prosperous industries. Some sort of arrangement may be made with Government offices from which these business orders emanate and with the management of large factories, whereby a portion of the orders can be directed or shared by industries so as to correct the lack of equilibrium that exists in the industrial organization. Officers specially in charge of this work will be attached to prefectural offices to see that the distribution of orders and the maintenance of the standard of manufactures as well as their delivery are regularly observed. Officers will also be attached to the local groups affiliated with the Central Industrial Association. For financing this phase of the work, a sum of ¥42,000 has been allocated by the Treasury for the current year.

(2) Increasing technical experts in the prefectural offices to direct changes of occupations. For the purpose of facilitating changes to new trades it is necessary to give the applicants considerable amount of training. Technical guidance in prefectural offices will be increased and training institutes in each prefecture will be conducted. Also, ways will be provided to enable people to take practical lessons in large factories. The Treasury has made an appropriation for a grant of ¥160,000 for this work.

(3) Further financial aid may be made for mechanical equipment required for effecting changes of trades. When many people seek to have equipment of their own, shortages in the necessary materials will result. A great majority of these people lack means wherewith to provide their own machinery. This state of affairs calls for the organization of associations of small industrialists, which will allow their members to make use of common equipment. These organizations will be partly subsidized by the Treasury. Government grants for the setting up of plants and equipments by the industrial associations for the year 1938-39 will amount to ¥3,300,000 in respect of change to war-supplies industries and to ¥1,000,000 in respect of change to the export and substitute articles industries.

(4) Government subsidies in the manufacture of sample goods for a time immediately after changes in occupations. The war-supplies industry requires speedy manufacture of fine machinery, but in case technical skill is wanting the manufactures are apt to fall short of the standard. This may prove to be a deterring factor in the successful change of trade. Likewise, change to the export and substitute goods industries is by no means easy because of the difficulty in acquiring new outlets due to lack of credit, technical skill and adequate advertising. To lighten the burden of preparing sample goods, at least for an early period, the Government will grant subsidies and has made an appropriation of ¥200,00 for the manufacture of samples of export and substitute articles as well as for the execution of orders taken from war-supplies manufactories.

(5) Prefectural offices will undertake the distribution, in small lots, of raw materials for export goods manufacture. In the manufacture of export goods, it so happens that, in spite of the possession of a large portion of materials, want of a small quantity of some other materials very often delays the completion of manufacture. Prefectural offices will see that small manufacturers in such a difficulty are promptly supplied with the needed materials; this task will be attended to by the technical experts attached to each prefectural office.

(6) Organization and alignment of commercial and industrial advisory organs. Where small- and medium-sized industrialists and merchants are unable to form associations due to lack of

Digitized by Google

means or numbers, individual technical guidance must be given. There will, therefore, be established in each prefecture a Central Commercial and Industrial Advisory Office, where direction and advice concerning change of trade, management and financing will be given by well-qualified advisers. Advisory organs already in existence will be aligned and brought under the control of the central organ. In aid of this work, the sum of ¥110,000 has been appropriated by the Treasury for the current year.

(7) Financing of capital required in the new trades. In addition to the sundry subsidies to be granted in connection with changes of occupations by people of small means, the Department of Finance, through the Treasury Deposit Bureau, will grant credit for part of the necessary capital up to the aggregate sum of ¥20,000. The manner of administering these credits will be determined by the Departments of Finance and Commerce and Industry. Furthermore, the terms and conditions governing the loans actually extended to the small- and medium-sized industrialists and merchants will be made easier and broader so as to render them available also for the purposes under consideration in the present article. The system of indemnification by the Treasury for losses that may arise with Government guarantees in operation in the prefectures and the six largest cities will be extended to cover the present work.

Care of Wounded Soldiers

With the expansion of hostilities in China, there was established on November 1st, 1937 a Provisional Division for Military Relief within the Bureau of Social Affairs of the Home Office. The Section for Protection of Wounded Soldiers of that division worked as the central organ making investigations and formulating protective measures for sick and wounded soldiers. But when the Department of Welfare was established in January, 1938, the work of dealing with these affairs was transferred to it. The new Department promptly organized the Council on Protective Measures for Sick and Wounded Soldiers, with the Minister of Welfare, Marquis Koichi Kido, as president. The detailed report of this Council which was presented at its second plenary session on January 27th, formed the basis of the present Government policy for the protection of sick and wounded soldiers. The necessary appropriations for 1938 were approved at the 73rd session of the Imperial Diet, and the Board for the Protection of Wounded Soldiers was established.

The Board has now become the central organ for the work of caring for disabled veterans. Under the jurisdiction of the Department of Welfare also is the work of assisting and directing prefectural authorities and various organizations engaged in similar undertakings.

The Board for the Protection of Wounded Soldiers is under the jurisdiction of the Minister of Welfare, and has charge of affairs pertaining to the healing and rehabilitation of wounded soldiers (including persons considered as such who were wounded or taken ill while in service).

The organization of the Board includes a president, a vice-president, a secretariate of general affairs, and two departments for planning and for general activities. The Planning Department consists of three sections for direction, planning and management, while the General Activities Department is divided into three sections of business, guidance and medical treatment. The presidency of the Board is an honorary office to be held by one with "shin-nin" rank, receiving Imperial appointment. As the first President, General Baron Shigeru Honjo has been appointed. In view of the importance of the work of the Board, as many as five advisers, 15 councillors and a number of technical experts have been selected to serve for two years.

An original appropriation of about ¥140,000 was made in 1937 to provide for the spiritual comfort and vocational guidance as well as medical treatment of disabled soldiers. To provide spiritual instruction and guidance, Major-General Chuon Sakurai, author of the famous book Human Bullets, and nine others were engaged. They visited and delivered lectures at all army and navy hospitals of the country. For vocational instruction, ten experts were commissioned by the Board and sent to these hospitals to train the injured veterans in future occupations. As for medical treatment, hospitals and clinics, both public and private, and hotels at various hot-spring resorts were entrusted with the care of the veterans in white.

These were merely emergency measures to meet the immediate situation. With the establishment of the Board for the Protection of Wounded Soldiers, regular and permanent work of protection was inaugurated, four main divisions of which are described below.

Emphasis is placed on the importance

Digitized by Google

of strengthening the spirit of loyalty in the wounded soldiers so that they will be ready as before to serve the State with honour and pride by exercising proper self-control. At the same time the general public is to be educated so that it will retain always its deep respect and gratitude toward the wounded veterans, who will happily be reinstated in society.

(a) Cultural Instruction for the Wounded

Despatching of lecturers to give spiritual guidance, lecture meetings, joint tours of inspection and study, meetings for moral and cultural advancement, production of motion-pictures, and distribution of suitable literature are among the measures placed in this category.

(b) Education of the General Public

The public is to be educated with a view to improving its attitude toward the disabled, through lecture meetings, encouragement of suitable literary production, and publication and distribution of various literatures. National educational campaigns are to be held every year to train the general populace in that regard in their everyday life.

(c) Other Measures

Public ceremonies in honour of wounded soldiers and the supervision and encouragement of various educational organizations concerned in work for soldiers are contemplated.

Medical Care Appropriate measures have been taken to provide the necessary medical care, in cases of relapse from recovery, tuberculosis and mental disorders after the patients have been discharged from hospitals, and to enable them to be treated in their home districts as far as possible in consideration of their family circumstances.

(a) Establishment of Sanatoriums for Wounded Soldiers

The present plan is to establish a sanatorium for mental diseases (with capacity of one hundred men), recuperatory sanatoriums in hot-spring resorts (ten such establishments at suitable spas, each with a capacity of caring for a hundred men at a time), and sanatoriums for tubercular cases (twenty-five establishments in suitable places in the country, each capable of holding five hundred patients).

(b) Treatments by Commission System

Until the above-mentioned establishments are erected, treatments for the wounded soldiers are entrusted as far as possible to public and private hospitals and hotels at hot-spring spas. Even after the completion of the government sanatoriums, this will be done in case these places are full and cannot care for more patients.

(c) Supply of Appliances and Medical Treatment

Such appliances as perambulators and beds are supplied as required, while medical treatment other than that mentioned in the preceding paragraphs is also given.

(d) Admission into the Institute for Wounded Soldiers

This Institute is located at Odawara in Kanagawa Prefecture.

Vocational Aid To enable the wounded soldiers to utilize their abilities to the fullest extent in accordance with environmental conditions and to face the future with hope, vocational guidance, adult education and assistance in finding suitable employments are given. In affording vocational aid, the policy is that the injured soldiers are, in principle, to be restored to their former occupations; but in the cases of those who cannot be so restored or who had no occupations before, new occupations are to be provided.

(a) Establishments for Vocational Direction

Besides giving vocational instruction at two or three "Institutes for Vocational Training" (accommodating two hundred men) to be established in different parts of the country, the existing establishment, the Keisei-sha, will be expanded to educate a hundred men at a time. Furthermore, in order to give minor vocational training, some fifty "Institutes for Vocational Training" will be founded and managed by different prefectures.

(b) Vocational Guidance

In order to give proper guidance to the wounded soldiers on matters pertaining to the nature of their injuries or illness with reference to occupations suitable to them, as well as to their individual desires and selection of their future occupations, various employment agencies are encouraged to be more active. Vocational advisers and officials in charge of affairs concerning vocational guidance are to be installed in prefectural offices.

(c) Expediting Employment

Efforts will be made to expedite the securing of employment for wounded veterans through redoubled activities on the part of employment agencies. Government offices are to be urged to lead the public in giving work to the injured soldiers and industrial circles are to be urged to cooperate. In the meantime, subsidies are being granted to those employers who make such altera-

Digitized by Google

tions in working equipment as will meet the requirements of the sick or wounded ex-servicemen.

(d) Encouragement of Independent Proprietors

Proper guidance will be given the wounded soldiers who are independent proprietors of business, and to them business capital will be loaned through protective organizations subsidized by the Government.

(e) Distribution and Repair of Artificial Limbs and Supplementary Apparatuses

To those who have been crippled, artificial limbs or other apparatuses are provided, thereby increasing their efficiency and making it easier for them to obtain jobs.

Relative Works (a) Aid for the Education of Children of Wounded Soldiers

As one of the primary interests of wounded soldiers is in obtaining education for their children, subsidies will be granted to prefectural offices with which supplementary funds for education of these children in intermediate schools will be created.

(b) Subsidy to the Japan Wounded Soldiers Association

Subsidies are to be granted to the Japan Wounded Soldiers Association, an organization founded by wounded soldiers for their mutual benefit, with which the association will establish its branches in various prefectures. These branches will each have a consultation office for wounded soldiers, which will give advice on personal affairs.

(c) Establishment of a Foundation

As an organ to aid the work for the care of wounded soldiers, an appropriate foundation is to be established which will support the work of finding occupations for wounded soldiers as well as the work of creating State establishments.

All these undertakings have been planned with due regard to the fundamental principle of Japan's polity and with reference to her past experiences and those of other countries. It is believed, therefore, that the enterprise, by virtue of its well-formulated organization and thoroughness, will achieve fully the object of protecting and caring for wounded and sick soldiers.

CHAPTER XXXI

LABOUR AND LABOUR MOVEMENTS

Labour

Vocational Classification

Statistics classifying the population in Japan proper according to the kinds of work actually engaged in and the number of employees in each occupation can be obtained from the Report of the National Census of 1930 as follows :

CLASSIFICATION OF PEOPLE IN JAPAN PROPER ACCORDING TO OCCUPATIONS

(The 1930 Census)

	Total	Male	Female	Total	Employee	Female
Total Population	64,450,005	32,390,155	32,059,850			
Unoccupied	34,830,365	13,359,918	21,470,447			
Occupied	29,619,640	19,030,237	10,589,403	20,037,851	10,676,109	9,397,742
Farming	14,140,107	7,743,065	6,397,042	9,133,417	3,173,283	5,960,334
Marine	546,624	501,078	45,546	314,378	271,258	43,120
Mining	251,220	210,174	41,046	241,430	200,496	40,934
Industry	5,699,581	4,269,151	1,430,430	4,037,681	2,808,985	1,228,696
Commerce	4,478,098	3,013,903	1,464,195	2,282,556	1,299,831	982,725
Transport	1,107,574	1,028,595	78,979	925,268	848,020	77,248
Public service	2,044,151	1,691,803	352,348	1,821,237	1,532,051	289,186
Domestic	781,319	84,203	697,116	781,319	84,203	697,116
Miscellaneous	570,966	488,265	82,701	536,365	457,982	78,383

According to investigations made by the Labour Section of the Social Bureau the classifications of labourers according to kinds of occupation at the end of 1935 was as follows :

Factory workers	2,791,902
Mine workers	274,804
Transport and communication	544,475
Day-labourers and others	2,295,408
Total	5,906,589
Male	4,146,960
Female	1,759,629

Labour Conditions

According to the investigation made by the police stations the total number of labourers in Japan proper was 6,422,333, consisting of 4,534,342 males and 1,887,991 females, at the end of 1937, a gain of more than 331,000 over the previous year. The following table shows the movements of the number of labourers in recent years. (The number of farmers is given in Chapter XIII.)

NUMBER OF LABOURERS IN JAPAN PROPER

(Compiled by the Home Ministry)

At the End of	1933	1934	1935	1936	1937	1938
Grand Total						
Total	5,126,719	5,764,277	5,906,589	6,090,116	6,422,333	6,765,399
Male	3,592,899	4,066,322	4,146,960	4,280,023	4,534,342	—
Female	1,533,820	1,697,955	1,759,629	1,810,093	1,887,991	—
Factory						
Total	2,234,029	2,539,384	2,791,902	3,067,417	3,406,969	—
Male	1,247,644	1,438,983	1,629,869	1,813,616	2,127,094	—
Female	986,385	1,100,401	1,162,033	1,253,801	1,279,875	—

Digitized by Google

At the End of	1933	1934	1935	1936	1937	1938
Mine						
Total	227,988	247,186	274,804	320,481	366,171	—
Male	202,862	220,084	247,668	285,414	311,390	—
Female	25,126	27,102	27,136	35,067	54,781	—
Transportation and Communication						
Total	556,929	555,124	544,475	565,264	549,324	—
Male	496,293	488,544	472,101	493,297	476,949	—
Female	60,636	66,580	72,374	71,967	72,375	—
Day Labourers, etc.						
Total	2,107,773	2,422,583	2,295,408	2,136,954	2,099,869	—
Male	1,646,100	1,918,711	1,797,322	1,687,696	1,618,909	—
Female	461,673	503,872	498,086	449,258	480,960	—

Factories and Labourers The number of factories where more than 5 operatives are employed in Japan porper at the end of 1937 was 106,005, an increase of 15,403 or 17.0 per cent as compared with the previous year.

The number of labourers employed in the 106,005 factories above mentioned at the end of 1937 was 2,936,512 (1,727,032 men, 1,209,480 women), gaining 343,825 or 13.3 per cent over the previous year. Classification of the same according to kinds of industry follows:

NUMBER OF FACTORY LABOURERS BY INDUSTRIES IN 1937

Sex Distribution

Industry:	Number	Percentage to the Total	Male	Female
Textile	1,032,510	35.2	201,355(19.5%)	831,155(80.5%)
Metal	310,490	10.6	286,551(92.3%)	23,939 (7.7%)
Machinery, tools, etc.	601,684	20.5	547,276(91.0%)	54,408 (9.0%)
Ceramic	112,857	3.8	88,033(78.0%)	24,824(22.0%)
Chemical	322,796	11.0	211,948(65.7%)	110,846(34.3%)
Lumber and wood-working	107,869	3.7	96,564(89.5%)	11,305(10.5%)
Printing and binding	64,652	2.2	56,547(87.5%)	8,105(12.5%)
Foodstuff	185,508	6.3	140,364(75.7%)	45,144(24.3%)
Gas and electric	9,286	0.3	9,234(99.4%)	52 (0.6%)
Miscellaneous	188,860	6.4	89,160(47.2%)	99,700(52.8%)

Labour Conditions in 1938

The Bank of Japan index number of labourers in mills under private management was 108.5 in December of 1936 (base:1926), and it rose to 129.2 in December, 1938. The rate of increase was 9.4 per cent in 1935, 6 per cent in 1936, 16 per cent in 1937, and 10.1 in 1938.

The change in the index number of labourers in recent years is as shown below. The boom in the munition

Digitized by Google

industries has caused a great increase in the number of labourers employed. The increase is much smaller in the case of female labourers than in that of male labourers. This is explained by the fact that the industries which are showing activity are those which require male labour.

Unemployment The first thorough investigation on unemployment in Japan was made at the national census of October 1, 1935; the number of jobless labourers and salaried-men at that time was 322,527. Annual estimates had been made by the Social Bureau since 1929, based on the reports sent in by local governments at the beginning of every month. The number had increased from 268,000 in September, 1929 to 505,000 in September, 1932. But the tendency turned at the end of 1932 as the result of the Government's emergency measures and an increased demand for labour in the heavy industries and an increase in the number of men called up for the services; the number of unemployed fell to 270,000 on December 1, 1937 and 227,000 on November 1, 1938. The rate of decrease of unemployment is greatest for factory and mine labourers as is shown below:

Labour Exchanges The conditions of labour exchanges are mentioned in Chapter XXX.

Extraordinary Condition of Unemployment

Certain branches of industry in Japan are now hard hit, while industries supplying war materials, since the outbreak of hostilities in China in July, 1937, have made rapid development. Industries manufacturing goods for export and articles classed as luxuries have suffered greatly, what with the cessation of trade with China, the lack of ships' space and what the practice of thrift and economy by the nation.

In view of the amount of commodities consumed and destroyed in modern warfare, an adequate supply of commodities is an essential condition of successful military operations. At the Cabinet meeting of June 23, 1938, the Government decided on a revised material mobilization plan, which purports to effect more vigorously the adjustment of supply of goods to this huge demand. On the 29th of the same month, laws were put into operation restricting the manufacture, processing and marketing of various important materials for internal consumption. As a result, an increasing number of factories and concerns manufacturing or distributing these commodities have since been compelled to suspend or close their business.

Unemployment Commission Organization of the Unemployment Commission was promulgated by Imperial Ordinance No. 507 of July 16, 1938. According to this Ordinance, the Commission is composed of the Central and Prefectural Unemployment Commissions, whose duty is to investigate the more important matters concerning measures to cope with the situation. The Central Commission is presided over by the Minister of Welfare and has a membership of not more than forty, while the prefectural bodies are under the direction of prefectural governors and have memberships of not more than thirty persons. In either case, additional members may be appointed. In fact, the Central Commission is composed of forty regular and 17 special members, and includes high officials of Government departments, including Vice-Ministers, the Vice-President of the Board of Planning, members of Parliament, 13 representatives of various industries, and 6 persons with technical knowledge and experience.

Stressing the urgency of the work of checking unemployment and administering relief, Minister of Welfare, made an inquiry at a meeting of the Central Unemployment Commission as to the measures to be taken for the cure and relief of the unemployment that might arise in connection with the China Affair, particularly in consequence of the mobilization of materials. The Commission conducted a careful investigation and submitted a report to the Welfare Minister.

This report consists of an introduction and the report itself which, again, is divided into three parts: (1) general measures, (2) prevention of unemployment, and (3) unemployment relief. While not neglecting the importance of inculcating upon the nation true appreciation and willing cooperation in the cure and prevention of unemployment, the report urges the Government to do its utmost to rid the country of unemployment or, where it is difficult for people to continue in their existing businesses, to guide and aid them in obtaining new employment.

General Measures (1) Spiritual Guidance. In line with the National Spiritual Mobilization movement, persons engaged in prosperous industries should be exhorted to use more self-restraint and denial to make positive efforts for

Digitized by Google

the cure of unemployment. Persons whose business is depressed are encouraged to persevere and work out their own salvation.

(2) Relief and protection for the families whose members have fallen in action. Where these families or the soldiers returning from the front are in danger of losing their employment, particular care and production should be administrated to them as far as is feasible.

(3) Organization of Commissions. Central and Prefectural Commissions are to be created whose duty is to study measures to cope with the existing situation and to put them into operation.

Prevention of Unemployment (1) Continuation or Change of Employment. The continuation of business is of course the most effective way for combating unemployment, but, where this is impossible, a change of personnel should be made to the war-supplies industries, to export trades or to the manufacture of the goods to be used as substitutes for mobilized materials. Such changes may be effected by adjusting the allotment of orders for goods. Business orders emanating from Government departments, including the army and navy, may possibly be allotted so that the weakened businesses may share in them. Prosperous industries should be induced to allow the depressed industrialists to do the work of manufacturing simple machine parts or to allot to them orders for primary materials. Depressed businesses should be supplied with substitute materials and, where necessary, the distribution of these materials should be put under control. Research institutions and laboratories may be mobilized; inventions and research work in the manufacture and use of substitute articles should be encouraged.

(2) Improvement must be made in the technical skill and business management of small and medium-sized tradespeople. For this purpose, the Central Unemployment Commission recommends that they be grouped to form associations, which will be provided with facilities such as receiving orders and purchasing substitute materials. Here, the people will also be given instruction and training in technical arts and business management.

(3) To enable small and medium-sized tradespeople in time of depression to effect changes to the war-supplies industries and other prosperous trades, it will be necessary to supply them with machines and materials and to give them technical training, which can best be done when people are grouped in associations.

(4) Loans will be granted to the associations referred to above and to owners of businesses.

(5) Advisory organs giving counsels on commercial and industrial questions will be created.

(6) In industries where there is danger of unemployment, the discharge of employees should be averted as far as possible by the use of such means as shortening hours and increasing rest-days. Where discharges become unavoidable, they should be made gradually, having regard to individual circumstances of the workers.

Relief Measures (1) Assistance in Finding Employment. Employment bureaus should be in close touch with all fields of employment. The labour exchanges should require proprietors of factories to report to them in advance the number of workmen to be dismissed, the time and order of dismissal, and should then make efforts to get people employed in war-supplies and other industries where labour is much in demand. Where the employed have to travel to the place of employment, travelling and other expenses may be advanced, if deemed necessary.

(2) Prosperous industries are urged to give employment to more people. The war-supplies and other prosperous industries are urged to increase the number of employees by adopting the shift system and by making conditions of employment easier.

(3) The training facilities of employment bureaus should be enlarged, while public and private labour exchanges should be induced to provide facilities for training in crafts. Where feasible, persons may be sent to private factories to undergo training and instruction.

(4) Public and private bodies will be asked to cooperate in giving instruction and training in technical matters to persons who, on account of age or previous occupation, have difficulty in adapting themselves to new employment.

(5) Household industries must be encouraged among the unemployed and their families, especially in the line of war supplies. These industries may be supervised by the tradespeople's associations, which will regulate the transactions, distribute materials and train the workers.

(6) Persons falling in category (4), described above, should, when individual circumstances favour it, be advised to return to farms to till the land; they may be aided in doing so.

(7) When persons are capable of emi-

Digitized by Google

grating, they should be encouraged to do so. Where necessary, training schools may be established for them.

(8) Both Government and public offices and enterprises should endeavour to absorb unemployed workers. The Central Unemployment Commission also recommends that work for the relief of the unemployed be provided in such fields as colonization and forestry, which are not affected by the mobilization of materials.

(9) Organizations for social work, the District Visitors group, and other welfare agencies may be enlisted to assist the unemployed who cannot otherwise find occupations, earn livelihoods and receive medical care.

(10) For all of the relief measures mentioned in this report of the Central Unemployment Commission, the Government may, when deemed necessary, provide appropriations and make advances of the required funds.

Actual Number The actual number of the extraordinary unemployment at the end of 1938 was 115,192 (26,360 shopkeepers, 88,832 employees), while the number of those who might lose job was 199,553 (53,155 shopkeepers, 146,398 employees), making a total of 314,745. As compared with November in which the total was 374,607, it was a decrease of 15.9 per cent.

Wages

According to investigations made by the Department of Commerce and Industry, the average wage of factory labourers per hour was 13 sen, in 1937, remaining same with the preceding years. The lowest 8 sen, was to be found among textile industry labourers, for a large number of women and juvenile workers are to be found in this industry. Details follow :

Labourer's Earning and Its Value The following table, compiled by the Asahi Shimbun, shows that the real value of the labourer's actual earning is gaining.

Digitized by Google

INDEX NUMBERS OF ACTUAL EARNING, AND REAL VALUE

(Compiled by the Asahi Shimbun)

(Base: 1914=100)

	Actual Earning	Real Value of the Actual Earning
Average for 1936	258.2	139.6
October, 1936	260.4	141.6
1937:		
January	261.8	139.3
March	267.8	141.3
April	271.0	141.4
October	280.0	143.4
1938:		
December	306.0	145.0
1939:		
January	306.0	144.0
April	315.0	146.0

Note: Real value is obtained by dividing actual earning by living cost.

Working Hour According to the report of the Ministry of Commerce and Industry, the number of working hours of labourers in 1938 and last 5 years was as follows:

AVERAGE DAILY WORKING HOURS IN 1938

	Monthly Working Days	Daily Working Hours
Kind of Industry		
Fabric	25.0	9:46
Metalic	24.8	11:04
Machine manufacturing	25.1	11:04

Yearly average (for 64 kinds)	10:05	10:07	10:05	10:10	10:13

It will thus be seen that labour is being strained in all its phases, especially in the heavy industries.

The working hours in the above statistics do not include time for rest. But time for rest has been shortened since 1929.

Labour Accidents Statistics for factory accidents, which have been published include only those figures up to 1935, but it is estimated that accidents have increased since. The number of the casualties which took place while labourers were at work, during 1935, according to the publication of the Social Bureau, numbered 75,926, exclusive of factories to which a portion of the Factory Law applies, and showed an

Digitized by Google

increase of 13,809 over the previous year. The number of accidents, as compared with the total number of labourers, began to increase suddenly after 1933. Among the casualties in 1935 female workers numbered 3,030 which corresponds to 4 per cent of the total number of accidents. The reason that the number of casualties in the case of women is comparatively small is explained by the fact that labour is more forced in factories, where male labour constitutes the bulk of the workers. Legal restrictions are also placed on female workers as protected labourers, and this contributes to the lessening casualties in their instance.

Year	Private Factories	Total number of Factories including Government-managed ones.
1926	2.23%	2.71%
1927	2.66	3.13
1928	2.56	2.92
1929	2.72	2.99
1930	2.62	2.86
1931	2.17	2.38
1932	2.14	2.31
1933	2.41	2.57
1934	2.85	2.89

The total number of casualties is shown below. When the sum of those killed and seriously injured is compared with the total number of casualties there was an increase from 24.7 per cent in 1932 to 25.8 per cent in 1934, and 25.7 per cent in 1935, which proves that not only is the number of accidents getting larger but the nature of the accidents is getting worse. The increase of casualties is partly due to the sudden increase in the number of labourers, which include many unskilled men, since 1932, but the rate of increase of casualties, which was 22.2 per cent greater in 1935 than in the previous year, is more than double the increase in the number of labourers, which was 9.5 per cent.

TOTAL CASUALTIES IN INDUSTRY

Year	No. killed	No. seriously injured	No. slightly injured	Total
1932	250	4,058	24,925	34,233
1933	404	10,802	37,157	48,363

Labour Hygiene. The hygienic equipment of factories is legally required, but progress of installation and improvement is rather slow and partial. In compliance with the requirements stated in the new ordinance on labour hygiene, factory managers are endeavouring to make improvements under the guidance of the Government and prefectural authorities, and good results have been reported as to the health of factory labourers where the work has been carried out. (See Chapters on Agriculture, Fisheries, and Mining.)

Labour Measures in the Emergency

Labour Changes and Training Technicians Shortages in labour are causing competition in employing workers or are inducing workers to change employment. A need has been seen of imposing certain restrictions on the movements of workers with the two-fold object of preventing unnecessary shifting of workers from one occupation to another and helping distribute labour equitably and properly.

The present shortage in labour is particularly pronounced among technicians and skilled workers. These technicians and skilled workers cannot be supplied readily at short notice. Many factories and other industrial institutions are already carrying on the training of skilled labour, which, however, is not necessarily being given properly nor does it adequately develop such skilled labour as is needed for the purpose of enlarging the productive power of the nation at large, if such training is left solely to the discretion of the factories and other industrial institutions concerned. The training of skilled labour as is undertaken by factories and other industrial institutions must be given systematically according to certain plans, with the actual shortage found in skilled labour and the volume of skilled labour to be needed for the future enlargement of productivity taken into due consideration.

For these reasons, the National General Mobilization Council, at its second plenary session held on October 31, 1938, passed a Summary Draft of an Imperial Ordinance Concerning the Training of Technicians at Factories and Other Industrial Institutions. The council followed up this action with the adoption of a Summary Draft of an Imperial Ordinance Restricting Employment of Operatives at its third plenary session held on December 5, 1938. Necessary steps have since been taken to promulgate these projected Imperial Ordinances.

The restrictions thus stipulated for imposition upon the employment of workers are summarized below. In the first place, the scope of workers on whose employment the said restrictions are to be imposed covers the following

Digitized by Google

four categories:

(1) Men between 16 and 50 years of age who are at the present moment employed and have been employed for more than three months in occupations designated by the Minister of Welfare.

These age limits are the same as the ones for those who are required to file declarations under the provisions of the Ordinance for Declaration of Vocational Abilities, while the occupations so designated by the Minister of Welfare number 93 which are also included in the total of 134 kinds of occupations specified under the Ordinance for Declaration of Vocational Abilities. The 93 different kinds of occupations thus designated include such divisions of mining, metal-work and machine-tool industries as are most seriously in need of skilled labour as well as other occupations such as electric engineering, electric communications, aircraft engineering, shipbuilding engineering, chemical engineering, civil engineering, woodwork engineering, gun-powder manufacturing, electric battery manufacturing, special glass manufacturing, optical glass manufacturing, boiler engineering, rigging manufacturing, etc.

(2) Men between 16 and 50 years of age who, after having been engaged for more than three months in the employment of others for the occupations designated by the Minister of Welfare as mentioned in (1), have terminated such employment after the enforcement of the Imperial Ordinance concerned, provided that such termination of employment occurred less than one year ago in the cases of the graduates of the schools designated by the Minister of Welfare and less than six months ago in the cases of others.

Workers in this category have been included in the cases of labour subject to restrictions on their employment, because undue competition in employing workers or in inducing them to change employment cannot be expected to be prevented effectively unless not only those in actual employment but also those who have until recently been in employment are made subject to the restrictions in question. As regards the periods during which the former employees are made subject to the said restrictions, certain school graduates are distinguished from others, the scope of such school graduates being approximately the same as that of school graduates who are subject to restrictions under the Ordinance for Restricting Employment of School Graduates, which was put into force some time ago under the stipulations of Article 6 of the National General Mobilization Law. Mention must be made, however, of the inclusion in the case under review of the graduates of several schools giving instruction in evening classes, whereas these types of school graduates are excluded in the case of the Ordinance for Restricting Employment of School Graduates.

(3) Those who are at the present moment undergoing training as apprentices under the provisions of the Ordinance for the Training of Technicians at Factories and Other Industrial Institutions, provided that their apprenticeship has lasted for more than three months.

Of those coming under this stipulation, those who are over 16 years of age and are engaged in any of the 93 varieties of work designated by the Minister of Welfare are of course subject to restrictions under the provisions of (1). The other apprentices who are being trained at factories and other industrial institutions under compulsory provisions of the Ordinance for Training Technicians at Factories and Other Industrial Institutions are made subject to restrictions as stipulated here in case they change occupations.

(4) Those who ceased to be apprentices less than six months ago after having been trained as such consecutively for more than three months under the provisions of the Ordinance Pertaining to training of Technicians at Factories and Other Industrial Institutions.

Restrictions to be imposed on the workers of the four above-mentioned categories are to be made effective when a factory or industrial institution is going to employ workers of the said categories, as the prospective employer is required to obtain permission irrespective of the kinds of work for which his workers are to be employed in case he is employing them in his factory or other industrial institution. In case any employer is going to employ these workers in places other than his factory or industrial institution, he is required to obtain permission provided that the work for which these employers are to be employed falls within the scope of the 93 kinds of occupations specified by the Minister of Welfare. However, in case consent has been obtained from the employers who are employing these workers in the kinds of work specified by the Minister or who are training them as apprentices, the permission stipulated above can be dispensed with in newly employing these workers. Similarly, in case consent has been obtained from the former employers of

Digitized by Google

the workers who have ceased to be their employees after having engaged in any of the occupations sepecified by the Minister, such workers may be newly employed without the permission stipulated above. In these case, however, the new employer is required to file a report of the employment of these workers, accompanied by a certificate showing that their former employers have no objection to their new employment.

Applications for the permission stipulated above are required to be prepared in a fixed form and filed with the director of the Government Employment Bureau under whose jurisdiction the factory or industrial institution where the prospective employees have been employed or trained as apprentices is located. In case the factory or industrial institution where these workers are to be employed is under the jurisdiction of the same Government Employment Bureau as the factory or industrial institution where the said workers have previously been employed or trained, it is obvious that the application for the desired permission need not be passed through any other authorities. In case, however, the factory, industrial institution or business office where the workers are to be employed is located in Chosen, Taiwan, Karafuto, the South Sea Mandated Islands, or any foreign country such as Manchoukuo, North China, Central China, etc., the application will have to be filed directly with the director of the Bureau under whose jurisdiction the said workers have hitherto been placed.

An application for such permission can be cancelled when any falsehood has been reported. When the application contains untrue statements or when the application is accompanied by irregularities, the permission which might have been given in response to the said application will be cancelled.

Further, there have been stipulated provisions for inspections and examinations in order to obtain materials for reference before deciding between permission and non-permission, or in order to see whether the employment has been completed properly after having obtained necessary permission, or in order to find out whether or not there have been irregularities committed in connection with the employment of workers who have been found to require no permission for their employment. Thus, in case one who has obtained necessary permission has employed workers subject to these restrictions, or in case one has employed such workers without permission, one is required to report such employment to the director of the Government Employment Bureau under whose jurisdiction the concern is located according to a specified form. In case the director of the Bureau deems it necessary in connection with the permission to be given for the projected employment, he is authorized to collect reports from persons interested or send officials in charge to the place of business to inspect the conditions of operation, books or other documents.

In case places of industrial operation of the army and navy, other government-operated works, government offices or prefectural governments employ works subject to restrictions under review, it is deemed inappropriate to make the procedures for obtaining permission applicable to such cases. Therefore, employment of workers in such cases is exempted from the application of the Ordinance for Restricting Employment of Workers.

Training of Technicians The factories and other industrial institutions which are carrying on operations specified by the Minister of Welfare are obliged to train technicians under the provisions of the relative Ordinance, provided that they have more than 200 male workers older than 16 years in their regular employ or that they are engaged in those kinds of work which are specially designated by the Minister of Welfare with less than 200 and more than 50 male workers older than 16 years in regular employ. However, owners of plants regularly employing more than 200 male workers may be exempted from the obligation to train apprentices with permission of the Minister in case it is extremely difficult for them to undertake such training. The industries specified by the Minister of Welfare for this purpose include five important metal-work industries and 17 leading industries manufacturing or repairing machinery and precision instruments. In case one factory or place of industrial operation is engaged in several kinds of work simultaneously, the said concern is to be regarded as coming under the designation of the Minister of Welfare if any of the different kinds of work falls within the scope of designation.

The industries specified for Article 2 of the Ordinance Pertaining to Training of Technicians at Factories and Other Places of Industrial Operation are: metal refining industries; metal rolling industries (exclusive of metal wire

Digitized by Google

manufacturing industries and metal foil manufacturing industries); blacksmith industries; metal casting industries; metal welding industries; metal-work and woodwork machine-tool manufacturing industries (including steel foundry machine tools manufacturing industries); mining, dressing and refining machine-tool manufacturing industries; industries manufacturing guns, shells, mines and arms; motor-engine manufacturing industries (boilers and gas generators manufacturing industries included); motors and other electric machinery manufacturing industries; electric communications machinery manufacturing industries; chemical engineering machinery and equipment manufacturing industries; manufacturing industries for pumps, water pressure machines, gas compressors, blowers, valves and cocks; manufacturing industries for belt wheels, gears, axles and ball bearings; rails and vehicle manufacturing industries; aircraft manufacturing industries; automobile and bicycle manufacturing industries; crane manufacturing industries; measuring, testing and scientific instruments manufacturing industries; optical machinery and instruments manufacturing industries; and medical instruments manufacturing industries.

Whether or not any factory or place of industrial operation has more than 200 workers older than 16 years, or whether or not it has more than 50 such workers in employ is to be determined by the total number of workers employed in the place as a whole, and not by the number of workers employed in the specified industries alone. Further, the obligation to train technicians devolves upon the factories or places of industrial operation, and therefore in case the management owns several factories or places of industrial operation, each of the latter places is to be considered as being under such obligation if it falls within the scope of the Ordinance in question.

The technicians are to be trained to qualify as "soldiers of industry" and to qualify intellectually as technicians of more than medium standing, with technical knowledge enabling them to pass considerably extensive technical judgments on productive activities and carry on operations even when left to their own discretion. These technicians are further expected to produce from among themselves leaders for the future, and for this reason experts skilled only in their own divisions of work are not qualified for the said training.

The qualifications of apprentices for such training are stipulated below. In case any factory or place of industrial operation finds it difficult to enlist a required number of such apprentices or in case the nature of the kinds of technicians to be so trained makes it inappropriate to enlist only those who are qualified as specified, it has been stipulated that those who are not fully qualified may be trained as apprentices with permission of the prefectural governor concerned. The qualifications are as follows:

(1) Males over 14 and less than 16 years of age when they start the training.

(2) Those who have finished the two-year course of the higher primary schools or the ordinary course of the young men's schools, or those who have been declared to have scholastic ability equal to or higher than the above-mentioned standards by the Minister of Education.

It has been deemed desirable that those who are under obligation to train technicians should spend a certain period in preparing plans, enlisting required numbers of apprentices and providing for facilities of supervision on training before starting the training, instead of commencing such training immediately on the dates when they find themselves placed under obligation. Therefore, it has been stipulated in principle that those who are placed under such obligation between January 1 and the end of February should start the required training during the month of April in the same year and that those who are placed under such obligation between March 1 and the end of December should do so during the month of April in the following year. For the year 1939, however, those who find themselves under obligation on the day when the Ordinance Pertaining to Training of Technicians at Factories and Places of Industrial Operation, are required to start such training once every year, commencing such training during the month of May in 1939.

Those who are under the obligation of training technicians are required to prepare plans for such training and obtain permission of the prefectural governors concerned. In the first place, these plans are required to include the statement of the kinds of apprentices for whom training is to be started and their number.

The number of apprentices to be trained is, in principle, to be more than the number to be obtained by multiplying the number of those who are required to file declarations under the

Digitized by Google

system of the national registration of vocational abilities employed in the psecified works (exclusive of engineers) by the percentage to be fixed by the Minister of Welfare (which is fixed as 4 per cent in the case of metal industries and 6 per cent in the case of machine-tool industries for the training to be started during 1939). For a factory or place of industrial operation regularly employing more than 1,000 male workers more than 16 years old and equipped with a practice shop or other facilities for training, it is stipulated that the said factory or place of industrial operation may be ordered to start the training of a certain number of apprentices to be fixed between the number corresponding to the fixed percentage and twice the said number. Further in case the number of the apprentices under training is found to be short of the required number at the end of any given year, the management is required to start training the required number plus the number of the shortage for the following year.

In case there exist special circumstances making it impossible for the required number of apprentices to start training according to the above-mentioned stipulations, the number of apprentices to be so trained may be cut with permission of the prefectural governor concerned.

The plans to be prepared are also required to indicate the methods by which the apprentices for training are to be selected and the number of trainers classified according to the different kinds of duties they are to assume. In case the prefectural governor concerned deems it particularly necessary, it is stipulated that he may order the appointment of such trainers as may be required.

The plans for which the permission of the prefectural governor are required are further to indicate the details of facilities of training such as classrooms, practice shops and dormitories. In this connection the governor is authorized to order the building of classrooms and their accessory in the case of a concern regularly employing 200 or more male workers more than 16 years old or the building of a practice shop in the case of a concern regularly employing 1,000 or more male workers older than 16 years.

The other matters to be covered in the plans include the hours to be devoted to the cultivation of moral qualities in apprentices as divided according to their different classes, the different scholastic courses for the apprentices and the hours of instruction to be given.

The period for training apprentices is fixed at three years in principle, and in cases where apprentices are to be given technical training for more than one year at practice shops or where there exist special reasons warranting the shortening of the training period without lowering the standard of training, the said period of training may be cut to the limit of two years.

The hours of training are stipulated as follows:

(a) More than 50 hours annually for spiritual training.

(b) More than 700 hours for the scholastic curriculum throughout the period of training.

The management may cut the hours to the limit of 550 hours with permission of the prefectural governor concerned in case special circumstances warrant such a cut.

(c) More than 5,000 hours for practice during the entire period of training. In case necessary permission has been obtained to cut the period of training to less than three years, the hours of practice may be cut to more than 3,500 hours.

The plans to be submitted to the prefectural governor prior to the starting of training are also required to state the wages and other allowances to be paid to the apprentices during the period of training. As the management is required to employ the apprentices after their training, it goes without saying that it is required to pay wages to the apprentices during the period of their training.

The hours of work per diem (including hours for training) are also to be specified in the plans to be submitted to the prefectural governor. In case the hours of work are subject to restrictions under other laws or ordinances, the training of apprentices is required to be carried on within such restrictions on working hours.

Holidays and hours for rest, as well as the estimates of expenses needed for the training, also have to be covered in the plans in question, it being stipulated that the burden of expenses for training should not be shared by the apprentices.

Further, in case the management, which in principle is required to train apprentices at its factory or other place of industrial operation, finds it difficult to do so for special reasons, it may train such apprentices at schools or other institutions equipped with facilities well adapted to their training or cause them to be so trained. In addi-

Digitized by Google

tion to the foregoing, statement must also be made of the following matters concerning the schools or other institutions concerned.

(1) The names and locations of the schools or institutions.

(2) The kinds and number of apprentices to be trained.

(3) The details of the courses to be given for the apprentices.

(4) The period during which the apprentices are to be trained.

In case any employer desires to revise the plans of training apprentices on which permission has been obtained, he is required to obtain permission of the prefectural governor concerned on such revisions. The governor may also order the employer to revise his plans for training apprentices. In case there arise special circumstances, after the commencement of training, making it difficult to continue training any or all of the required number of apprentices, training may be discontinued for any number of apprentices with permission of the governor. In case any of the individual apprentices is considered to have no prospect of becoming a worker of more than medium standing, permission may be obtained to discontinue training of such an individual, in which case the required number of apprentices is to remain short.

It is stipulated further that reports may be collected or official visits or inspections may be made occasionally in order to maintain adequate supervision. To be more exact, the Minister of Welfare or the prefectural governor concerned is authorized to collect reports regarding the training of technicians or send officials in charge to factories, places of industrial operation, business offices or other places to inspect books and other documents concerning the training of apprentices. Moreover, the employers are, it is also stipulated, required to file reports to the prefectural governors concerned regarding the appointment of trainers and regarding other circumstances concerning the training.

Adjustment of Labour in Rural Communities The China Affair, together with the influence it has exerted on the industrial life of the nation, has drained heavily on the labour resources of rural Japan. Since the outbreak of hostilities two years ago, men and horses from the rural communities have been mobilized for military service on the China battlefields. Additionally, the ever-increasing demand for workers in munitions factories and other industries connected with the current emergency has called a vast number of young men from the farms. This great outflow of men and animals has affected the agricultural labour power of Japan to an unprecedented extent, and the Government has taken the following measures for counteracting unfavourable sequences of the decrease of agricultural labour power and for carrying agricultural production through without difficulty:

1. Coordination and Adjustment. The Government now is planning the adjustment of labour power, including animals and machines, taking the conditions of agricultural production into consideration. The Government also is devising plans concerning the absorption of farm labourers by the munitions industry, based on the labour power adjustment programme. For these purposes, an appropriation is provided in the supplementary budget for the 1939-40 fiscal year, enabling the local commissions on regeneration and the agricultural associations to frame basic plans for the investigations of agricultural labour power. On the basis of these plans, the Government is trying to coordinate and carry out all the measures for the purpose. Thus the supply of labour power for the munitions industry will be made according to a definite programme.

2. Organization of Labour Service Groups. This is a plan to organize labour service groups in various towns and villages, the unit of these activities being one community. The purpose of these groups is to replenish the shortage of labour in the households of farmers called to the colours, not only stabilizing the livelihood of these families but also maintaining the balance of production. The Government in this manner aided 8,931 agrarian towns and villages in 1937 and 9,989 last year.

3. Cooperative Work. Cooperative labour is not an innovation in Japanese rural life. But in the face of the shortage of labour power since the inception of the China Affair, it has become necessary to encourage this practice widely in order to increase efficiency in agricultural labour. Thus the Imperial Agricultural Association and prefectural and local organizations have been aiding in the promotion of joint work. The number of farmers' unions guided by agricultural associations in this connection since the current hostilities stands at 121,176.

4. Transferring Collective Labour. Shortage of labour power in some instances cannot be corrected by such measures as labour service groups and

Digitized by Google

the encouragement of joint work. Particularly in districts where labour power has been supplied by other towns, villages or prefectures during the busy seasons, even in time of peace, necessity is felt all the more keenly for taking further steps for this supply. As a countermeasure for supplying labour power during the busy periods, therefore, a plan has been worked out for the transfer of labour power in groups by taking advantage of the differences in time of the planting and harvest seasons in various rural communities.

5. Distribution and Coordination of Farm Machinery. The situation is becoming such that the consumption of various commodities must be restricted to a considerable extent, by reason of which it is becoming difficult to expand farming equipment by new installations of machinery. This situation, therefore, makes it necessary to make the maximum use of those machines already in existence, by adjusting the uneven distribution among districts, by making joint use of those which are not in full use privately, and by repairing and restoring to service those which are out of order.

6. Means of Production in Agricultural, Mountain, Fishing Villages. (a) Availability of Improved Farming Implements.

The Agricultural Promotion Association and other organizations should furnish various kinds of improved farming implements for joint utility.

(b) Distribution of Implements Operated by Animal Power.

Existing implements should be given wider joint utility in regions where animal power is available.

(c) Encouragement of Simple Water Power Facilities. In agricultural regions where potential water power is available, simple devices should be made for harnessing water power.

(d) Supply of Power Boats for Cooperative Use.

Small power boats used for towing fishing craft should be given wider use to relieve the shortage of labour in fishing villages.

(e) Establishment of Joint Sericultural Facilities.

This is to alleviate labour conditions n the silk producing districts, through joint equipment measures by the Sericulture Promotion Associations.

7. Exchange, Division and Consolidation of Farm Lands. In Japan, farmers own or cultivate patches of land in scattered places, wasting potential labour in getting from one place to another. This situation hampers efficient farm management. The Government recently has revised the Special Tax Law incidental to the China Affair, providing for the exemption of registration taxes in cases where the ownership of land for cultivation and perpetual tenant-right are exchanged, thus facilitating the exchange, division and consolidation of farm lands. This exemption from taxes, allowed in cases of exchange, division and union, is made through the mediation of Farm Land Commissions of cities, towns and villages. Under the direction of the Government, these commissions strive actively to facilitate such arrangements on the part of farmers, subsidizing the operations involved.

8. Supply and Renting of Farm Horses. Due to the requisition of farm horses, the shortage of animal power and the consequent loss of natural fertilizer resources is great. To correct this deficiency, the Government is aiding the joint purchase of horses through prefectural governments and various organizations and also is facilitating renting of horses.

9. Supply of Cattle. Under the current emergency, the number of cattle slaughtered for beef and leather has increased considerably. This measure is designed to encourage cattle raising and to rationalize the distribution of livestock, as it is feared that a serious shortage of animal power and self-supplying fertilizer resources will develop if the present tendency is not checked.

Regislation of Vocational Abilities A system of registering vocational abilities of the people at large, for which preparations had been going on for some time, went into effect as from January 20, 1939, as provided in Ordinance No. 5 promulgated on January 7th, on approval of the National General Mobilization Council.

The system can be explained, briefly, as one in which the State registers working abilities of the people, abilities for mental as well as physical types of work. It can accordingly be called the System for National Registration of Vocational Abilities. The National General Mobilization Law provides, in Article 21, for obliging Japanese subjects to report on and to be examined concerning their vocational abilities. This system of general registration, however, is not applied to physicians, dental surgeons, pharmaceutists, veterinary surgeons, and mariners. For with regard to those engaging in medical and related professions and occupations, a separate, special Ordinance for registering their abilities has already been

Digitized by Google

promulgated, and with regard to the others of this group, similar Ordinances concerning their respective vocational groups will soon be promulgated.

Employment exchanges have been designated to act as agencies for registration under the present system. The change from municipal to national management of these employment exchanges, which was effected in July, 1938, has made them peculiarly fitted for the purpose, since by this change they have come to be widely and adequately distributed throughout the country, improved in organization and activities, and operated with the view of nation-wide, rational adjustment of supply and demand of labour.

In the light of the above-stated purpose of the national registration system, the best way of carrying it out may require the registration of all the members of the nation who are capable of working in some way in time of emergency, regardless of age, sex and occupation. Such a step, however, not only exhausts the time and energy of the competent authorities but is unnecessary for the practical purpose of national labour mobilization. The present system, therefore, specifies certain categories of vocational and other abilities deemed most urgent in war-time labour mobilization as constituting the qualifications for being registered.

They are:

1. Japanese subjects: aliens will not be registered.

2. Male subjects: women also may be included in wartime labour mobilization; however, as men will form the immediate objective of the mobilization, women are excluded from this system.

3. Male subjects above 15 and below 50 years of age: this age restriction is adopted from the consideraiton that those who are within these ages are most suitable for mobilization; those outside these age limits, therefore, might possibly be mobilized in time of war.

4. Subjects residing within the Japanese Empire: those Japanese subjects residing in foreign countries are excluded from this system.

5. Subjects who are of the categories named below:—

a. Those who have pursued vocations designated by the Minister of Welfare for more than three consecutive months. As for the designated vocations, some 130 classes relating to war industries or those considered as essential for military operations have been named, including mechanicians, miners, forgers and turners. Classes of designated vocations will increase in the future according to the actual needs. The time restriction is adopted for the purpose not only of ensuring the minimum amount of skill but of preventing complexities in registration arising from cases of leaving and changing vocations, which occur most frequently within the early months after starting in them.

b. Those who have pursued the vocations stipulated in the foregoing for more than one year without intermission within the period of the past five years. The requirement of one year is made out of the consideration that it is the minimum length of time in which can be acquired a fair degree of skill in vocations, and the requirement of within the period of the past five years in consideration of the possible lowering of skill already acquired by extending the period.

c. Graduates of universities, colleges and technical schools designated by the Minister of Welfare, who have taken the authorized courses. Graduates of such educational institutions are considered to have acquired adequate vocational abilities and skill by the fact that they have successfully completed the prescribed courses. The designated institutions are mainly technical schools above the middle grade, and the designated courses are such technical courses as mechanical, electrical, mining and metallurgical engineering and applied chemistry.

d. Those who have completed work in technical training institutes designated by the Minister of Welfare, such as training institutes for mechanics established by the State or municipalities. They are considered as qualified for registration for the same reason as graduates of the schools stipulated in the foregoing.

e. Those who have obtained licences or certificates by passing examinations and tests designated by the Minister of Welfare, such as those for chauffeurs and farriers.

Exemption is made, however, from the registration in the cases of those coming under the categories named below:

1. Men in the services who are on the active list or those who have been called to the colours in time of war and of other emergencies in accordance with Clause 2 of Article 55 of the Military Service Law.

2. Cadets enroled in the active service.

3. Civilians in the employ of the Army and Navy.

4. Physicians, dental surgeons, pharmaceutists, veterinary surgeons, and

Digitized by Google

mariners coming within the purview of the Mariners Law.

Examination of Vocational Abilities In view of the objective of the national registration system which lies in the rational mobilization of vocational abilities of the people in time of emergency, keeping the records of their abilities in clear and definite terms is essential. Reporting to be made by the persons concerned and their employers regarding their vocational careers and technical skill according to the given standards is a feasible but by no means satisfactory method of keeping such records and of supplying data for judging and estimating the kinds and grades of their abilities. In order to ensure accuracy in the estimation to the greatest possible extent, therefore, the National General Mobilization Law provides for the examination of vocational abilities of the people. And this examination will be conducted, in principle, by prefectural governors and directors of local employment bureaus under the following procedure.

1. Judging by Computation Formula. This is a method of judging the adequacy or inadequacy of the report concerning the degree of skill by a certain formula or standard worked out by computing statistically inter-relations between years of experienc and degrees of skill. In applying this method to a report, if the reported degree of skill agrees with the formula, the adequacy or validity of the report is considered as established and the report is accepted; but if discrepancies are found the reporter is subjected to practical examination.

2. Practical Examination. According to this method, individual registered persons are made to perform a given piece of work, and by their ways of doing things and the results of their work the grades of their skill are adjudged. The important questions are what kinds of work should be given as the test and what methods of grading the results be adapted. With a view to working out such standards, a central institute for examination of technical skill will be created. Test questions worked out in this institute are to be used by the officials in charge of examinations who are attached to prefectural governments in giving the work-test to individual workers at individual and other establishments.

With regard to certain classes of those employed by the State who are within the purview of this system of national registration, particularly those in the employ of the governmental establishments designated by the Minister of Welfare, which are mostly establishments of the Army and Navy, special provisions are made for reporting, examining and registering their vocational abilities. They are to be reported upon to employment bureaus through those establishments. When, however, those qualified for these exceptional provisions become disqualified, they are placed under the general rules concerning the reports and other requirements.

All these provisions concerning the national registration of vocational abilities will be carried out by empowering directors of employment bureaus and prefectural governors to require other reports deemed necessary for the purpose of the system from persons concerned and to make inspections of factories and other establishments.

Control of Wage Rates For the necessity of controlling the commodity prices, the problem of unchecked rise in wage rates has been studied by the competent authorities in the Ministry of Welfare and the Central Wage Commission in the Ministry decided the standard wage rates of inexperienced operatives at employment as follows at their general meeting which was held on June 24, 1939. The decision was made to keep the average rates in the mine months from April to December, 1938, as standards for the latter half of 1939, or from 10 to 20 per cent lower than the rates prevailing in the first half of 1939. The wages stated in the following table are for 10 working hours (rest hour inclusive) a day in the case of factory operatives and 9 working hours in the case of mine workers in the pit, and for an extra hour 10 per cent increase is allowed.

Wage	0.45	0.50	0.55	0.60	0.65	0.75	0.85	0.95

Health Insurance As to the business conditions of the State Health Insurance mentions are given in Chapter XII, Insurance, and here it will be suffice to give mentions on some items directly to do with labour.

Insured persons are entitled to benefit when they are injured while in service or become ill, or in case of maternity. In case of death benefits are paid to their dependents. In the fiscal year of 1936-37, there were as many as 10,848,429 cases for which benefits were given to the amount of ¥45,882,742. Of the total, the number of cases directly arising from work was 1,211,274 with the payment amounting to ¥3,713,674, details of which follow:

	Cases	Amount paid (In Yen)
Medical treatment	921,020	—
Prolonged treatment	14,157	87,670
Medical treatment for the injured	273,956	3,533,818
Funerals	2,141	92,187
Total	1,211,274	3,713,674

Of the total 1,211,274 cases, the number of casualties was 796,678.

The number of cases which directly arose from work and handled by the Health Insurance in recent years was as follows:

Fiscal Year	Cases	Amount Paid in yen
1932-33	526,823	1,752,785
1933-34	639,728	2,024,485
1934-35	807,734	2,558,332
1935-36	1,018,915	3,209,735
1936-37	1,211,274	3,713,674

It is generally understood that the accidents and casualties are increasing with the advance of years, but the yearly increase in figures given above does not necessarily speak of the fact, because the reports of factories and associations from which the figures are compiled are increasing as it is shown in the following table:

Digitized by Google

At the end of March,	Under Governmental Management		Associations	
	No. of Factories	No. of Persons insured	No. of Associations	No. of Persons insured
1933	48,525	1,122,141	347	598,058
1934	54,356	1,294,926	345	706,555
1935	61,241	1,503,550	349	823,144
1936	113,719	2,096,657	370	947,277
1937	123,605	2,346,637	379	1,104,833

Labour Disputes

The number of labour disputes in 1931 recorded highest with 2,456 including 998 which were accompanied by strikes, sabotages or lockouts. The following 4 years showed a decreasing tendency in labour disputes, their number in 1935 being 1,872 including 590 cases accompanies by strikes, sabotages or lockouts. But in 1936 the number rose once again and in the first half of 1937, it surpassed the corresponding period of the record year 1931, and then suddenly began to decrease after July, 1937, when the North China incident occurred.

The reason for the decrease in the number of labour disputes in 1932 and after may be found in the occurrence of the Manchurian incident in September 1931 and the consequent change of thought among the people in which nationalism gained an ascendency over the socialistic ideologics of labour leaders. The leaders themselves altered their concepts and showed a spirit of co-operation with capitalists in promoting the benefit of industrial enterprises. The prosperity attending the heavy industries and the export trade also had much to do with the decrease in labour disputes, and the nature of disputes was considerably modified.

The increase in 1936 and the first half of 1937 was caused not by any change in thought but by a purely economic reason, namely, the increase in wage did not correspond to the rise in prices. The sudden decrease in the second half of 1937 was exceptional, being the result of the emergency situation and the national mobilization of men and resources. The tendency prvailed in 1938 and the number of disputes decreased to a half of 1937. The following table is given here to show the general conditions of labour disputes during past 15 years, 1934-38.

LABOUR DISPUTES IN 1924-1938

Tenant Disputes

In the past 5 years tenant disputes centred round the protection of the tenant rights, or the demand of tenants for the continuation of their tenure. The difficulty for a farmer to get another farm has become much greater than that of finding work for a labourer in a city. To lose one's farm is to starve, and tenant disputes along this line are accordingly acute. The number of tenant disputes in 1937 and 1938 decreased as shown in the following table.

TENANT DISPUTES

Year	Number	Tenant Participants	Area Included (In cho)
1933	4,000	48,073	30,343
1934	5,828	121,031	85,129
1935	6,824	113,164	70,160
1936	6,804	77,187	46,036
1937	6,170	63,246	39,255
1938	3,331	31,445	20,871

The causes, demands and results of disputes in the past 5 years have been as follows :

TENANT DISPUTES

Trade Unions

Annual Meetings in 1936 The fifth annual meeting of the Japan Trade Union Council (Nippon Rodo Kumiai Kwaigi) was held at Yokohama on October 18, 1936, Komakichi Matsuoka presiding over the 69 delegates who were present. Ten decisions were arrived at, of which the most important were "Recommendations to the Government for the establishment of a Ministry of Labour," and a "Resolution against the suppression of the trade union movement among Government factory labourers," besides the declaration of the fifth council which voiced its stand in liberalism in sympathy with the Social Mass Party.

The Japan Trade Union Council lost the Japan General Federation of Trade Unions (Nippon Rodo Kumiai So-rengo) in 1935 from among its important members and was further weakened, in September, 1936, by the prohibition of the trade union movement among labourers in Government factories belonging to the War Ministry. The Council, however, was successful in bringing about the formation of the All-Japan General Federation of Labour and the National Trade Union Federation in 1935, and added to its power by the coming in of the Japan Federation of Ceramic Trade Unions in 1936, it thus remains the largest organization of trade unions in Japan, with a membership of 9 bodies and 263,914 labourers.

The new officials and the present members of the Japan Trade Union Council are as follows :

President, Komakichi Matsuoka
Vice-president, Manryo Yonekubo
Chief-secretary, Aiichi Kamijo
Adviser, Bunji Suzuki
Executive Committee : Shinichi Yagi, Suehiro Nishio, Bunsaku Hamahashi, Choei Horiuchi, Hidekichi Koizumi, Yasutaro Kawamura, Kichitaro Numada, Eiichi Iwanaga.

Members :	Number of Members
Japan Seamen's Union	104,306
All-Japan General Federation of Labour	94,926

Seamen's Association	13,086
Japan Iron Labourers' Union	12,500
Japan General League of Labour	6,068
Tokyo Electric Company Workers' Union	2,450
Japan Federation of Ceramic Trade Unions	3,500
9 bodies Total	263,914

The first meeting of the All-Japan Convention of Patriotic Trade Unions (Aikoku Rodo Kumiai Zenkoku Konwakwai) which was organized in April, 1936, by the union of all patriotic or nationalistic trade unions with reactionary ideas in general politics, was held at Tokyo on September 27, 1936. The meeting was carefully watched by the public as the Convention stands in opposition to the Japan Trade Union Council. With six planks in its platform "Propagation of the Japanese Spirit", "Demand for the Establishment of an Industry and Labour Council," "Institution of a Law for the Control of Industry and Labour," "A Thorough Industrial Service for the Country," "Nationalization of a Labour Festival peculiar to Japan" and "Unity of the War Front of Labourers and Farmers," the meeting proceeded under the leadership of President Tsunekichi Yamazaki. There were 168 delegates from the different member unions present. Among several reports, there was one which showed the attitude of the Convention towards the Government prohibition of the trade union movement in Government factories. The standing committee had requested the authorities to allow Government factory workers to enter patriotic trade unions only, but apparently in vain.

It passed 6 resolutions, the chief being, "Nationalization of Electric Power," "Request for the Organization of a New Patriotic Political Party" in opposition to the old social and democratic parties, and "Destruction of the People's War Front." They denounced present social and democratic thought as being mere imitation of the West and

Digitized by Google

contrary to Japan's national constitution, and upheld a reorganization of all trade unions in the spirit of love for the country in the true Japanese spirit.

The Council is composed of 15 unions with an aggregate membership of 80,278. Its officials and member unions are as follows :

Officials :
Standing Committee,
Kyuzo Takayama, Nisaburo Nishiyama, Harufusa Ohashi, Kenji Tsuyukubo, Kisaburo Yao, Tsunekichi Yamazaki, Shizuma Yagasaki, Tokuju Niizuma.
Treasurer, Shuji Okubo
Secretary, Rikichi Minagawa

The 15th anniversary of the All-Japan Farmers' Union was celebrated at Osaka for 3 days September 7-9, 1936. This union, which was first organized by M. Sugimoto and T. Kagawa, has the oldest history of all farmers' unions in Japan and occupies the most important position in the trade union movement among farmers. A short history of farmers' union movement in different prefectures is published.

The general meeting was held on September 8, with 399 delegates present. The meeting passed resolutions requesting, (i) the institution of tenant and tenant union laws ; (ii) opposing the proposed increase of taxes that fall on the masses ; (iii) requesting the lowering of the price of electric power, (iv) declaring the intention of the union should be to obtain the security of farmers' living by (a) better tenant and farming conditions, (b) the securing of land for practical farmers and ousting of the landowners, (c) the improvement of land and farming technique and management so as to bring about better returns to farmers, (d) organizing an all-Japan farm workers union inviting tenant and half-landed farmers and farm labourers to belong, and finally, (e) establishing a new society through the activities of the All-Japan Farmers' Union in co-operation with city proletarians.

The president of the standing committee of ten is Motojiro Sugiyama and the chief-secretary is Minoru Ito. The number of members of the union is over 40,000.

The first general meeting of the Japan Industrial Labour Club (Nippon Sangyo Rodo Club) was held at Tokyo on October 24, 1936. The club was inaugurated in June, 1933, as a patriotic organization of trade unions on the principle of oneness of capital and labour and no class antagonism, but had had no opportunity of calling a general meeting before. At the meeting 647 representatives were present, and under the leadership of Kumazo Ishii they passed resolutions on the organization of a new patriotic political party and the establishment of an Industry and Labour Council, confirming similar decisions passed by the September meeting of the All-Japan Convention of Patriotic Trade Unions mentioned above, for this club is one of the strongest members of the Convention. The club is composed of 18 smaller unions with an aggregate membership of 18,550.

The tenth general meeting of the Japan General Federation of Trade Unions, another powerful member of the All-Japan Convention, held at Tokyo on November 15, 1936. This Federation had seceded from the Japan Trade Union Council in September, 1935, and entered the Convention, turning from liberalism to nationalism. The meeting passed 10 resolutions among which the most important was that regarding " the promotion of a political war front of patriotic trade unions." The officials of the Federation on the day of the meeting was as follows :

Officials :
President, Kyuzo Takayama
Vice-president, Bukichi Imai
Chief-secretary, Eiichi Mori

Advisers, Kesaya Yamazaki, Chukichi Kaneko
Central Executive Committee, Fusaji Ohashi, Minekichi Takahashi, Keiji Takahashi and others.
Membership :
43 unions with an aggregate membership of 29,802.

The 3rd general meeting of the All-Japan Council of Trade Unions was held at Tokyo on November 15 and 16. Among trade unions in Japan this body is most inclined to the left, and is close to the Japan Trade Union Council, their slogans being, "Institution of a Trade Union Law," "Institution of a Labour Protection Law," "War for Higher Wages," "Union of Anti-Fascist Bodies," and "War against the Increase of the Tax Burden of the Masses." At the meeting Kanju Kato presided over the 190 representatives present, who expressed their hope to be united with the Social Mass Party in political matters and with the Japan Trade Union Council in trade union matters. The All-Japan Council of Trade Unions is composed of 42 unions and about 15,000 members. Present officials are :

President of the Central Executive Committee, Kanju Kato
Chief-secretary, Hideo Yamahana
Central Executive Committee, Minoru Takano, Toraichi Nanba, Shikaichi Yasuhira, and others.

Trade Unions in 1937 The activities of the labour movement in 1937 chiefly centred round a demand for higher wages in the face of the rapid rising tendency of commodity prices since the fall of 1936 and an opposition to the raising of the taxes affecting the masses.

The central committee meeting of the All Japan Federation of Labour which was held on January 11 passed a resolution "to begin a movement for increased wages by adoption of peaceful but positive measures," and despatched instructions to its member unions all over Japan on the course of action to be followed. The All-Japan Council of Trade Unions issued orders to its member unions with the same objective and all other trade unions followed suit with the result that a large number of labour disputes based on wage issue were recorded during the first half of the year. The demand was for raising wages from 10 to 30 per cent. Many of the employers showed a compromising attitude and the disputes ended for the time being with a rise of 5 to 15 per cent in wages. In the meantime the Social Mass Party, which is supported by the Japan Trade Union Council, scored a great victory in the general election of April 30, obtaining 928,000 votes (aginst 518,000 obtained at the last election) and sent 37 members (against the former 18) to the House of Representatives. The labour movement in the first half of the year made a good advance in both economic and political fields.

The second half, however, turned out to be bad because of the occurrence of the China incident. The emergency situation that followed demanded the co-operation of the entire nation. The expansion of industrial activities and the economic control by the Government put a stop to labour union disputes. The occasion was one which demanded sacrifice for the country and the labouring classes were to bear a large share of it A large number were called to the colours and sent to the front in China and a considerable amount of human power was mobilized for industries directly or indirectly connected with military operations. The social democratic labour unions changed their ideology, at first, to industrial co-operation with capital and then to nationalism; even the leftist unions showed a compromising attitude toward capital for industrial co-operation.

The Japan Trade Union Council held its 6th general meeting in Osaka on October 10, and declared, "At this period when our country is engaged in an international conflict in which she is throwing all her might our spirit of patriotism is deeply stirred and we cannot allow ourselves to think of our personal interests. The great mission before us is to give ourselves to the country and render our lobour inspired by the object of bringing about the general welfare of the entire nation. The Japan Trade Union Council will do its best by upholding these ideals before the labouring classes. . . . The Council is one of the most patriotic bodies in the country because it is a body organized by the masses who are engaged in actual toil for the advancement of the country," and promised its co-operation and service for the country as a representative federation of labour unions. When the Central League for National Spiritual Mobilization was organized the Japan Trade Union Council became a member and promised to give its positive support to the spiritual mobilization movement initiated by the Government, and des-

Digitized by Google

patched, Bunji Suzuki, one of its leaders, to the United States as a people's ambassador for presenting Japan's case in the present conflict to the labour unions in that country.

The All Japan General Federation of Labour decided to make collections for raising a fund for soldiers and the bereaved families and to urge members to purchase the Patriotic Bonds issued by the Government by monthly instalments declaring, "as long as the present international conflict lasts we are confident that we shall find peaceful and just means for settling all disputes between capital and labour, and do not have to resort to strikes for settlement of our problems."

The old and new Japan Seamen's Unions which had been hostile to each other since their secession in May 1935, were united again into a single Union in March 1938, and seceded from the I. T. F. at Amsterdam in September, 1937.

The Social Mass Party has changed its ideology from class struggle to co-operation, and Isoo Abé, its chief leader, expressed his willingness to bring the Party in line with other national movements in order to cope with the present emergency situation. Kanichiro Kamei, a representative of the Party went to the length of declaring, in his speech in the House of Representatives in September 1937, that the Party did not stand for socialism. On October 15, 1937, the 6th national meeting of the Social Mass Party adopted a new platform which emphasized nationalism.

Arrest of Leftist Leaders The Police Bureau of the Home Department, issued orders to the Tokyo Metropolitan Police and other 17 prefectural police offices on December 15, and had some 400 leaders of the Japan Proletariat Party and the All-Japan Council of Trade Unions arrested. Among those arrested were such popular labour leaders as Kanju Kato, Kin Yamakawa, Tsunao Inomata, Gitaro Omori, and K. Arahata. The Party and the Council were ordered dissolved on December 22, 1937, on the ground that "the Japan Proletariat Party has, as its principal aim, the establishment of anti-Fascist people's front, the true aim of which is the mobilization of the masses toward communistic revolution and the changing of Japan's national character in accordance with Bolshevik principles," and that "the All-Japan Council of Trade Unions is the main support of the Japan Proletariat Party, the leaders being common to both, and seems to be still holding the revolutionary principles of the former labour unions in this country."

As to the nationalists, the Patriotic Labourer Farmer Society and the Japan Industrial Labour Club were amalgamated into one organization under the former name, on August 8, 1937, and the new society held its first national meeting on December 21, and announced that "the Society is a labour union which aims at the realization of Nipponism."

The advance of the nationalistic labour unions in the political field was in general unsuccessful in the first half of 1937, but a plan for organizing a new political party with the former political Reform Council at the centre, was carried out by the nationalists and the Nippon Kakushinto (Japan Reform Party) was organized on July 18 (vide The Japan Year Book, 1937, P. 173).

Birth of the Patriotic Industrial Association

The outstanding event in the annals of the trade union history in Japan was the birth of the Patriotic Industrial Association(Sangyo Hôkoku Kai) in 1938. The organization of the Association was first initiated by the Arbitration Society for the purpose of readjusting the relations between capital and labour in the time of emergency. A special commission in the Society recommended, early in 1938, the organization of such associations in factories and industrial establishment all over the country, and within a few months the number of the Patriotic Industrial Associations became so many that the Central Patriotic Industrial League was organized on July 30th. The Central League, then began a national campain for the spread of the principles of the association among the employers and workers in all kinds of factories and for the organization of the association in every one of them in all the districts of the country. On August 24, 1938, the Government decided to give a helping hand to the movement and issued an order, in the name of Vice-Minister of the Home and Welfare Departments, to encourage the organization of a patriotic trade union in every factory if possible. Thus the movement became semi-governmental and the number of the Patriotic Industrial Associations rapidly increased. In view of the necessity of national control, the leadership and supervision of the Associations was finally transfered from the Central Patriotic Industrial League to the Gov-

Digitized by Google

ernment on April 24, 1939, and the National Federation of the Patriotic Industrial Associations was organized, while the Central League was reorganized so as to take the part of education and propaganda only.

According to the report published by the Government on July 20, 1939, the number of the associations reached 5,332 with a membership of 1,849,000. There is no doubt that the appearance of such patriotic trade unions will bear hard upon the existing trade unions and federations which are confronted with the danger of dissolution or scisson among members.

TRADE UNIONS

(Compiled by the Ministry of Welfare)

	Unions	Members	Total Number of Labourers	Union Percentage
1930	712	354,312	4,713,002	7.5
1931	818	368,975	4,729,436	7.9
1932	932	377,625	4,860,276	7.8
1933	942	384,613	5,126,719	7.5
1934	965	387,964	5,764,277	6.7
1935	993	408,662	5,906,589	6.7
1936	973	420,589	6,090,116	6.9
1937	837	395,290	6,422,333	6.1

Farmers' Unions Farmers' unions are changing from temporary to permanent organizations, and are steadily increasing in number. According to the Ministry of Agriculture and Forestry in 1921 there were only 681 tenant-farmers' unions, and their growth is shown below. The number of landowners' unions correspondingly increased from 192 in the same span of time. Opposition between the two is apparently much wider in scope and deeper in nature.

FARMERS' UNIONS

	Landowners		Tenant-farmers		Landowners and Tenant-farmers	
	Unions	Members	Unions	Members	Unions	Members
1929	655	55,138	4,156	315,771	1,986	244,943
1930	640	53,278	4,208	301,436	1,980	247,880
1931	645	50,556	4,414	306,301	2,047	255,088

CHAPTER XXXII

MEDICINE AND SANITATION

Introduction

Sanitary affairs of the country were placed under the supervision of the Sanitary Bureau, Home Department, until 1938 when the Bureau was transferred to the new Welfare Department, and divided into two bureaux of public hygiene and of disease prevention. The report for 1937 is, therefore, that of the old Sanitary Bureau. Sanitary establishments under the direct control of the Bureau are 6 health centres in 6 largest cities, the hygienic laboratory, the Institute of Nutrition, 3 national leprosaria, the National Tuberculosis Sanatorium, and the Institute for Infectious Diseases. Special committees or boards are the Committee for the Examination of Medical Practitioners, the Committee for the Examination of Dental Surgeons, the Committee for the Examination of Pharmacists, the Central Board of Health, the Board for the Investigation of the Japanese Pharmacopoeia, the Board for the Investigation of National Hygiene, the Opium Committee, and the National Parks Committee.

Health Preservation Work

Control of Foods and Beverages

Milk. In the following table are given the actual number at the end of 1937 of persons engaged in the milking, handling and selling or milking and selling, or handling and selling or selling of cow's milk, and of dairy firms, milk plants, and of milk-cows, as well as the quantities of milk produced during the same year :—

Persons engaged in milking, handling and selling of milk	4,799
	* 41
Persons engaged in milking and selling of milk	25,111
Persons engaged in handling and selling of milk	1,914
Persons engaged in selling of milk	3,862
Dairy firms	30,422
	* 41
Milk plants	6,445
	* 41
Number of milk-cows	107,878
	* 753
Quantity of milk produced	262,314,993 (Litres)
	*1,802,813
Quantity of milk handled	160,519,418
	*1,455,369

Note :—* Refers to special milk. Of 41 persons who were engaged in the milking, handling and selling of special milk, 36 had some other additional business, and of 160,519,418 litres of milk handled 118,372 litres was skimmed milk.

GOAT'S MILK

	1937	Compared with 1936
		(Litres)
Persons engaged in production and sale of goat's milk	606	39 (incr.)
Number of goat-milk dairies	614	51 (,,)
Number of milk-goats	6,482	446 (,,)
Quantity of goat's milk produced	1,575,766	282,977 (,,)

MILK-PRODUCTS

	1937	Compared with preceding year
	(kg.)	(kg.)
Condensed milk	1,406,212	75,054 (incr.)
Unsweetened condensed milk	866,303	168,598 (decr.)
Condensed skimmed milk	331,994	139,298 (incr.)
Powdered milk	117,530	92,164 (decr.)
Unsweetened powdered milk	130,581	21,553 (incr.)
Powdered skimmed milk	6,130	901 (,,)
Butter	715,423	605,348 (,,)

Snow and Ice The number of traders in snow and ice (those who gather and sell natural ice, and those who manufacture ice artificially and sell it for the purpose of consumption) at the end of 1937 and the quantity of snow and ice gathered and manufactured during the year compared with the figures for the preceding year are given in the following table :—

	1937	Compared with 1936
Traders is snow and ice	1,636 persons	72 (decr.)
Artificial ice	2,699,039,119 kg	410,266,958 (incr.)
Natural ice	59,291,065 ,,	66,232,183 (decr.)
Snow	154,752 ,,	1,126,416 (,,)

Non-alcoholic Drinks The number of manufacturers of non-alcoholic drinks at the end of 1937 was 3,347 showing a decrease of 210 over the preceding year.

	1937	Compared with 1936
Mineral water and Plain Soda Water	668	16 (incr.)
Ramuné	1,835	43 (decr.)
Cider	1,542	39 (,,)
Lemonade (including Fruit water, Peppermint water and Cinnamon bark juice)	1,958	58 (,,)
Fruit Juice, Syrup and others	1,631	48 (,,)
Acid drinks made from milk or milk-products	230	23 (incr.)

The following table gives the quantity of non-alcoholic drinks manufactured in 1937:

	1937 (Litres)	Compared with the Preceding year
Mineral Water and Plain Soda Water	8,291,972	1,334,575 (decr.)
Ramunè	43,744,847	3,323,997 (incr.)
Cider	52,177,373	2,513,718 (,,)
Lemonade (including Fruit water, Peppermint and Cinnamon bark juice)	18,486,295	919,819 (,,)
Fruit Juice, Syrup and others	17,673,521	2,073,193 (,,)
Acid drinks made from milk or milk-products	2,752,981	620,383 (,,)
Total	143,126,989	8,114,535 (,,)

The total quantity of refreshing drinks as given above, when compared with the total population for the year, comes to 2.01 litres per inhabitant, showing a decrease of 0.09 litres compared with the preceding year.

Waterworks During the year from April, 1937 to March, 1938, sanction was given for the construction of waterworks in the following 34 localities:

*Shirikishinai village, Hokkaido; Hachinohe city, Aomori prefecture; *Watanami town, Miyagi prefecture; Onahama town, Fukushima prefecture; Ohta town, Gumma prefecture; *Yoshihama village, Kanagawa prefecture; Tsubame town, Niigata prefecture; *Hirao village, Nagano prefecture, *Sannomaru Waterworks Users Union (private), Gifu prefecture; *Kitakano village, Shizuoka prefecture; Mitani town, Aichi prefecture; *Tai waterworks Union (private), Kyoto prefecture; *Nariu Waterworks Union, (private) same prefecture; Ryuge village, Kami village, Ohtori town, Yao town, and Kashiwara town, Osaka prefecture, *Joto Waterworks Union same prefecture; *Naruo village, *Hanshin Waterworks Municipal Union, *Hanshin Express Electric Railway Company (private) (a portion of Muko village) and *Hanshin Express Electric Railway Company (private) (a portion of Sonoda village), Hyogo prefecture; Koriyama town, Nara prefecture; and *Osaka Electric Tramcar Company (private) same prefecture; *Ubeno village, *Gamo village, *Tago

Digitized by Google

village, Tottori prefecture; *Juzo Minato and other three men's Union, Hiroshima prefecture (private), and *Habu town Waterworks Union (private), same prefecture; *Yobuko town Waterworks Union (private), Saga prefecture; *Mogi town, Nagasaki prefecture; Saganoseki town, Oita prefecture; *Sankasho village, Miyazaki prefecture.

Those places which obtained permission to construct waterworks may be classified as follows :

Undertaken by	No. of Waterworks to be constructed	No. of Waterworks Completed
Cities	120	117
Towns and Villages	405	368
Town or Village Association	6	6
	* 2	* 1
Prefecture	4	4

Undertaken by	No. of Waterworks to be constructed	No. of Waterworks Completed
Private parties	115	108
Total	625	604

Note :—Refers to those established by the city, town or village guild.

Sewerage During the year 1937, permission to construct sewers was given to three places, namely; Seto city, Aichi prefecture, Himeji city and Sumiyoshi village, Hyogo prefecture.

The places which had already obtained permission to construct sewers were 46 places, consisting of 39 cities, 6 towns and one village.

Removal of Foul Matter The following table gives a general idea of the removal of foul matter conducted in 1937 in 146 cities, under the provisions of the Law for the Removal of Foul Matter.

Number of houses within the districts in which removal of refuse was carried out		4,795,227
Removal from the above-mentioned houses	Refuses	3,390,450,442 kg
	Dirt	645,449,165 ,,
	Night-soil	14,027,551 kl
Average amount removed per house	Refuses	707.0 kg
	Dirt	134.6 ,,
	Night-soil	2.9 kl
Number of houses from which the holder of the land removed refuse under Art. XXI of the Regulation for Enforcement of the Law		150,559
Number of incineration plants		152
Amount of refuse burnt		1,879,692,200 kg
Water-closets with purifying equipments		17,877
Number of water-closets directly connected with the main under Art. 12 of the Regulations for the Enforcement of the City Building Law		68,817

Note:—(1) The number of houses, incineration plants and water closets was the same as that which existed at the end of 1937.
(2) The figures of night-soil given in the table represent only those for which city authorities are held responsible for its removal.
(3) Number of incineration plants does not include the provisions for burning in the open.

Slaughter-houses The total number of slaughter-houses at the end of 1937 was 714, of which 103 were established by cities, 381 by towns and villages, 43 by live-stock raisers' or industrial associations, 187 by private individuals. When compared with the figures of the preceding year, it shows an increase of 12 in city slaughter-houses, 1 in those established by towns and villages, and 5 in those of live-stock raisers' or industrial associations, and a decrease of 14 in those privately established. If these slaughter-houses are considered according to locality, it is found that the largest number is Hokkaido which has 65, followed by Kagoshima with 31, and the prefectures of Hyogo, Chiba, Niigata, Nagano, Tokyo, Fukushima, Ibaraki, Gumma, Okinawa, Iwaté, Shizuoka, Aichi, Hiroshima, Yamaguchi, Miyé, Shimané, and Oita have each from 15 to 25; the prefecture with the smallest number is Fukui with 5, and Tottori with 6 each, followed by Wakayama and Shiga with 7 each; Miyazaki, Nara, Ehimé, Gifu, Toyama and Aomori are also prefectures with but few slaughter-houses, each having not more than 10.

Digitized by Google

Slaughtering The number of animals of various kinds slaughtered in 1937 for food purpose and its comparison with the figures for the preceding year are given here (those slaughtered in emergencies or for household use are not included) :

Kind of Animals	No. of Cattle slaughtered in 1937	Compared with 1936
Cattle	345,385 heads	52,225 (incr.)
Calves	43,661 „	10,421 „
Sheep	2,534 heads	1,037 (incr.)
Goats	4,207 „	152 „
Pigs	1,222,249 „	42,140 „
Horses	71,427 „	23,459 (decr.)

The following table gives the weight of meat yielded in 1937 by the slaughtered animals and a comparison of the yield with that of the preceding year :

	Total weight		Average weight per head	
	1937 kg	Compared with 1936 kg	1937 kg	Compared with 1936 kg
Cattle	64,523,122	8,978,802 (incr.)	186.82	2.65 (decr.)
Calves	2,647,629	932,709 („)	60.64	9.05 (incr.)
Sheep	46,927	18,269 („)	18.52	0.62 (decr.)
Goats	43,654	4,998 („)	10.38	0.85 (incr.)
Pigs	60,042,749	1,410,177 („)	49.12	0.56 (decr.)
Horses	10,497,131	3,211,382 (decr.)	146.96	2.49 (incr.)

The number of cases of emergency slaughter in 1937 (slaughtered outside slaughter-houses without formal steps being taken on account of injuries or helpless condition by accident, difficulty of delivery, puerperal anesthesia, or acute tympanities) was 1,453 of cattle, 61 of calves, 271 of pigs and 956 of horses and the number slaughtered in the same year for private use consisted of 342 calves, 141 sheep, 1,279 goats and 21,548 pigs.

Inspection of Imported Meat The total amount of meat imported in 1937 at the ports of Yokohama, Tsugaru, Osaka, Kobé, Ujina, Shimonoseki, Moji, Nagasaki and Izuhara was 13,086,484 kilogrammes, of which 3,519 kilogrammes were condemned. Compared with the preceding year, the amount of meat inspected increased by 3,876,669 kilogrammes, and condemned meat by 3,401 kilogrammes. Classified by the kinds of meat, it was as follows :

	The weight of meat inspected (in kg)	The weight of meat condemned (in kg)	Ratio of condemned meat (%)
Fresh Beef	368,557	—	—
Chilled Beef	7,244,483	3,519	0.49
Frozen Beef	5,384,240	—	—
Mutton	52,900	—	—
Goat meat	554	—	—
Horse meat	33,660	—	—
Pork	2,085	—	—
Total	13,086,484	3,519	0.27

Poisoning The total number of persons poisoned in 1937 was 12,666 (a decrease of 7,363 on the preceding year), of which 7,410 (58.50 per cent) were poisoned intentionally, 5,213 (41.16 per cent) by accident and 44 (0.34 per cent) through other's injuries; and of these persons poisoned 3,278 died, of which 2,924 were those poisoned intentionally, 332 those poisoned by accident, and 22 those poisoned by others, so that 39.41 per cent of those intentionally poisoned died, 6.41 per cent of those accidentally poisoned also died, and 55.16 per cent of those poisoned through other's injuries also succumbed. Of poisonous substance the most frequently used in intentional poisoning and poisoning through other's injuries are chemicals, especially a preparation containing phosphorus; accidental poisoning is mostly due to eating poisonous animals, plants or putrefied food.

Burials and Cremations The total number of burial-grounds at the end of 1937 was 975,682 and their total area was 23,405 hectare, making the average area of burial-ground 0.02 hectare, and the total number of crematoria at the end of the same year was 34,534, in which 707,164 bodies were cremated during the year, so that a crematorium burnt on an average 20.48 bodies. In the same year 608,329 bodies were buried uncremated so that those cremated came to 53.76 per cent and those buried uncremated to 46.24 per cent of the total number of burials, which, when

Digitized by Google

compared with the percentage for the preceding year showed an increase of 1.84 per cent in those cremated.

Insane Persons The total number of insane persons at the end of 1937 was 90,753, showing an increase of 4,706 over the figures for the preceding year. Its ratio to the population of the country in that year was 12.74 per 10,000, which, compared with the preceding year, shows an increase of 0.49.

The following table gives the number of insane persons at the end of 1937, classified according to the places of their custody or confinement :

	Actual Numbers			Percentage		
	Males	Females	Total	Males	Females	Total
Admitted into Insane Asylums under the Law concerning Asylums for the Insane	1,667	883	2,550	2.92	2.63	2.81
Admitted into Substitute Asylums under the same Law	4,127	2,420	6,547	7.22	7.20	7.21
	*2,147	*1,291	*3,438			
Under Custody in the Asylums or Hospitals	4,341	2,329	6,670	7.60	6.93	7.35
Under Custody in other places	5,858	1,350	7,208	10.25	4.02	7.94
Under Temporary Custody	94	28	122	0.16	0.08	0.14
Not requiring Admission or Custody	41,066	26,590	67,656	71.85	79.14	74.55
Total	57,153	33,600	90,753	100.00	100.00	100.00
	*2,147	*1,291	*3,438			

Note:—Figures marked with * refer to those who were under custody at places that may be included among the category of substitute asylum out of the figures just above the line.

Tuberculosis The following table shows the results of health examinations conducted in 1937 by the prefectural governments, in accordance with the provision of Art. IV, Clause I of the Law for the Prevention of Tuberculosis :

	1937	Compared with the preceding year
Estimated number of persons requiring health examination	1,596,010	207,089 (decr.)
Number of persons examined	1,252,114	190,644 („)
	*73,353	*48,434 („)
Number of persons diagnosed as tuberculosis patients	601	85 (incr.)
Ratio of the patients per 1,000 of the examined	0.45	0.16 („)
Number of persons ordered to suspend from work	90	11 („)

Note:—The figures marked with an asterisk are those for whom more than two examinations were made.

Trachoma The following table shows the result of examination conducted by the prefectural government during 1937, in accordance with provision of Art. 4, clause 1 of the Law for the Prevention of Trachoma :

	1937	Compared with preceding year.
Number of persons examined	6,522,554	633,192 (incr.)
	*703,782	*456,639 (decr.)
Number of trachoma cases:		
Severe cases	39,453	272 (incr.)
Mild cases	409,495	19,422 (decr.)
Suspected cases	123,549	1,669 („)
Total	572,497	20,819 („)

Digitized by Google

	1937	Compared with preceding year.
Ratio of cases per 100 persons examined	7.92	0.50 („)
Number of patients ordered to refrain from work	207	39 („)

Note:—The figures marked with asterisk are those for whom more than two examinations were made.

Health Examination of Prostitutes The prostitute quarters actually existing at the end of 1937 (the term prostitute quarters does not here and hereinafter necessarily mean segregated quarters, but is also intended for convenience's sake to include all places where licensed prostitutes have been permitted to carry on their trade) numbered 392, being a decrease of 7 from the preceding year. The daily average during the year of licensed prostitutes in these quarters was 44,908, showing an increase of 788 over the preceding year.

The number of health-examination stations for these prostitutes was 368, showing a decrease of 7 from the preceding year, and the total number of examinations made in these stations was 2,770,427, showing an increase of 98,273 over the preceding year, and in 59,454 cases the prostitutes were found diseased. The ratio of cases of diseases to the total number examined was 2.15 per cent, i. e. 0.04 per cent lower than in the preceding year. The number of hospitals for admitting these diseased prostitutes (including places for treatment lacking hospital accommodations) was 138, and the average number of times a prostitute was admitted into hospital during the year was 1.32 and was same as the preceding year.

The percentage of prostitutes pronounced diseased among those examined for health was, if we examine the different prefectures, highest in Gifu prefecture (4.49%), followed by Shiga (4.32%), Osaka (3.38%), Okinawa (3.08%), Wakayama (2.91%), and Chiba (2.68%), while the lowest was in Ishikawa prefecture (0.30), followed by Iwaté (0.49%), Toyama (0.54%), Nagano (0.67%), Ibaraki and Niigata (0.81%), and Kumamoto (0.82%).

The following table gives the number, classified according to diseases, of prostitutes in the whole country who were during the year found to be diseased upon examination; when two or more diseases are found in the same person, the one which appears first in the table is taken to be the principal disease; thus for instance, if a person is suffering from both syphilis and gonorrhoea, she is taken to be infected with the former disease and the latter is added to the number in bracket under gonorrhoea (the percentage for the preceding four years are also given for comparison):

In-patients

	Actual Number, 1937	Percentage 1937	1936	1935	1934
Syphilis	467	16.54	21.42	15.83	16.41
Gonorrhoea	1,101 (65)	41.30	39.29	34.77	34.17
Chancroid	1,255 (62)	46.65	42.88	56.06	54.23
Total	2,823				

Out-patients

	Actual Number, 1937	Percentage 1937	1936	1935	1934
Syphilis	1,349	16.37	12.34	14.90	17.70
Gonorrhoea	5,356 (111)	66.35	66.57	73.21	68.11
Chancroid	1,535 (57)	19.32	23.30	14.32	16.35
Total	8,240				

Note:—In the percentage of cases of diseases, the diseases which are found in one and the same person are taken as separate cases, so that their total exceeds 100.

Cholera The total number of cases of cholera in 1937 was 57 with 20 deaths (no case occurred in the preceding year). The ratios of these cases and deaths to the population in the same year were 0.01 cases and 0.00 deaths per 10,000 inhabitants. Below are given prefectures where cases of cholera broke out:

Digitized by Google

Prefecture	Cases	Deaths	No. of cases per 10,000 inhabitants
Hiroshima	40	15	0.22
Yamaguchi	10	3	0.08
Okayama	5	1	0.04
Tokyo	1	—	0.00
Hyogo	1	1	0.00

Of the above total number, 43 cases broke out in urban districts, and it represents 75.44% of the total number for the whole country. There were 18 deaths therefrom. The rate of above cases and deaths to the urban population was 0.02 cases and 0.01 deaths to 10,000 inhabitants.

Dysentery, Including Ekiri The total number of the cases of dysentery in 1937 was 78,284 and there were 18,427 deaths therefrom which, when compared with the figures for the preceding year, shows an increase of 26,209 cases and 2,687 deaths. The ratios of these cases and deaths to the population in the same year were 10.99 cases and 2.59 deaths per 10,000 inhabitants, showing, compared with the preceding year, an increase of 3.58 cases and 0.35 deaths.

Typhoid Fever The total number of cases of typhod fever in 1937 was 38,542 with 6,617 deaths, showing an increase of 1,604 cases and 150 deaths compared with the preceding year. The ratios of these cases and deaths to the population in the same year were 5.41 cases and 0.93 deaths per 10,000 inhabitants, showing, when compared with the preceding year, an increase of 0.15 cases and 0.01 deaths.

The total number of cases of typhoid fever reported for urban districts only, during the year was 18,909 which corresponds to 49.06 per cent of the cases for the whole country. Of the above number, there were 3,376 deaths.

The ratios of these cases and deaths per 10,000 of urban population was 7.53 and 1.34 respectively, showing, when compared with the preceding year, an increase of 0.24 while that for deaths remained stationary.

Paratyphoid Fever The total number of cases of paratyphoid fever in 1937 was 4,480, of which 292 ended fatally, showing, when compared with the preceding year's figures, a decrease of 295 cases and 1 deaths. The ratios of these cases and deaths to the population in the same year were 0.63 cases and 0.04 deaths per 10,000 inhabitants, which shows when compared with the preceding year, an increase of 0.05 cases while the death-rate remained unchanged.

The total number of cases of paratyphoid fever reported for urban districts only in 1937 was 2,065 which corresponds to 46.09 per cent of the total number of cases for the whole country, and the deaths therefrom numbered 123.

The ratios of cases and deaths per 10,000 of urban population was 0.82 and 0.05 respectively, showing, when compared with the preceding year, an increase of 0.02 cases, but with no change in death-rate.

Smallpox In 1937 the total number of cases was 90 with 6 deaths. Compared with the figures of the preceding year, there was a decrease of 88 cases and 23 deaths. The ratios of these cases and deaths to the total population in the same year were 0.01 cases and 0.00 deaths per 10,000 inhabitants. The largest number of cases occurred in Fukuoka prefecture, it being 25 cases with 1 death: in the other prefectures the number of cases was less than 24. (In 1936 there were 178 cases with 29 deaths). The total number of cases of smallpox in urban districts was 32 (2 deaths), corresponding to 35.56 per cent of the total number of cases for the whole country, and the ratio to 10,000 of urban population shows 0.01 cases and 0.00 deaths.

Typhus In 1937, total number of cases of typhus was 17, but there was no death. Compared with the preceding year, cases increased by 16, while deaths decreased by one. The ratio of these cases to the population in the same year was 0.00 per 10,000 inhabitants, being same as in the preceding year.

Scarlet Fever The total number of cases of scarlet fever in 1937 was 17,603 with 480 deaths, showing, when compared with the preceding year's figures an increase of 896 cases and a decrease of 7 deaths.

The ratios of these cases and deaths to the population in the same year were 2.47 cases and 0.07 deaths per 10,000 inhabitants. Compared with the preceding year, there was no change in both ratios.

Diphtheria The total number of cases of diphtheria in 1937 was 28,111 with 4,059 deaths, showing, when compared with the preceding year's figures, a decrease of 123 cases and 135 deaths.

The proportion of these cases and deaths to the population in the same year was 3.95 cases and 0.57 deaths per 10,000 inhabitants, showing, when compared with the preceding year, a decrease of 0.07 cases and 0.03 deaths.

Digitized by Google

Epidemic Cerebrospinal Meningitis The total number of cases of epidemic cerebrospinal meningitis in 1937 was 839, of which 481 ended fatally, showing, when compared with the preceding year's figures, a decrease of 164 cases and 133 deaths. The proportion of these cases and deaths to the population in the same year was 0.12 cases and 0.07 deaths per 10,000 inhabitants, showing a decrease of 0.02 cases and 0.02 deaths on the preceding year.

Plague No cases of plague occurred in 1937.

The following table gives the situation of cholera and four other infectious diseases in the country during the fifty-five years since 1887:

FIFTY YEARS OF INFECTIOUS DISEASES

	Cholera		Dysentery		Typhoid Fever		Smallpox		Diphtheria	
	Cases per 10,000 Inhabitants	Deaths per 1,000 deaths from all causes	Cases per 10,000 Inhabitants	Deaths per 1,000 deaths from all causes	Cases per 10,000 Inhabitants	Deaths per 1,000 deaths from all causes	Cases per 10,000 Inhabitants	Deaths per 1,000 deaths from all causes	Cases per 10,000 Inhabitants	Deaths per 1,000 deaths from all causes

Note:—Among the number of dysentery cases since 1922 (October) includes ekiri.

Vaccination The total number of the 1st period vaccination performed in 1937 was 2,031,232, of which 1,908,237 proved positive and 66,372 negative while 56,623 were not examined for the result of vaccination. Compared with the figures of the preceding year, there was a decrease of 115,785 in the total number of vaccinations, of 117,082 in the number of positive vaccinations, and an increase of 5,223 in negative vaccinations, and again a decrease of 3,926 whose result was not examined.

The total number of the 2nd period vaccinations was 2,011,374, of which 1,215,149 proved positive, 765,489 negative while 30,736 were not examined of their result, showing, compared with the figures of the preceding year, a decrease of 36,268 in the total number vaccinated, and 40,903 in the positive takes, and an increase of 6,001 in the negative, and a decrease of 1,366 in the number of unexamined cases.

The following table gives the number of public and private vaccinations both for the first and second times in each period:

			1st Time Vaccination	2nd Time Vaccination
First Period	Public Vaccination	Positive	1,795,331	60,982
		Negative	46,323	16,742
		Not yet examined	51,340	5,283
		Total	1,892,994	83,007
	Private Vaccination	Positive	50,954	970
		Negative	2,589	718
		Total	53,543	1,688
Second Period	Public Vaccination	Positive	1,116,471	94,789
		Negative	478,241	284,230
		Not yet examined	24,876	5,860
		Total	1,619,588	384,879
	Private Vaccination	Positive	3,258	631
		Negative	2,102	916
		Total	5,360	1,547

The special vaccinations were carried out in 1937 in 36 prefectures, including Tokyo, Kyoto, Osaka and Miyagi, and the total number of persons vaccinated thereby was 4,204,400.

Port Quarantine The total number of vessels inspected in 1937 by harbour offices of the Custom Houses and by temporary port quarantine stations was 24,281 Japanese vessels (with a total tonnage of 84,695,271) and 5,978 foreign vessels (with a total tonnage of 37,856,396), making a total of 30,259 vessels (with a total tonnage of 122,551,667). The total number of persons inspected was 2,877,586, of which ships' crews numbered 1,657,126 and passengers 1,220,460. Compared with the corresponding figures of the preceding year, the number of vessels increased by 1,467 and that of crew and passengers by 187,808. By these inspections were found 9 persons suffering from smallpox, 3 persons from cholera and 81 from other notifiable infectious diseases, making a total of 93 cases. Compared with the preceding year, this shows an increase of 12 cases.

Of the above mentioned vessels inspected, 264 vessels and 5,777 persons thereon were subjected to disinfection. When compared with the preceding year, there was an increase of 250 vessels and 5,396 persons. The vessels subjected to detention numbered 93, being an increase of 84 when compared with the preceding year. The destruction of rats and insects was carried out on

Digitized by Google

1,431 vessels and 7,409 rats were caught, which, compared with the preceding year, shows a decrease of 160 in the number of vessels and of 126 in that of rats.

Rabies In 1937, there was no case of rabies in men. The number of rabid dogs in 1937 was 5 reported in Tokyo prefecture showing an increase of 2 compared with the preceding year. (In 1937 there was no rabid animal other than dogs). The number of persons bitten by rabid dogs in 1937 was 3 in Tokyo prefecture, showing no change on the preceding year. The number of persons who had preventive injection for rabies in 1937 was 3,748, showing an increase of 601 on the preceding year. Of the above number, 3 were those who had been bitten by rabid dogs, and 3,745 by animals suspected of rabies.

Bacteriological Laboratories The number of bacteriological laboratories at the end of 1937 was 195, consisting of 145 established by prefectural governments, 24 by cities, 1 by towns and villages and 25 by private individuals, showing an increase of 2 in the total number on the preceding year.

If we examine the number of these laboratories according to locality, we find that Shizuoka prefecture had the largest number with 13, followed by Hyogo prefecture with 12, Osaka and Nagasaki prefectures with 9 each, Hokkaido, Miyagi, and Hiroshima prefectures with 7 each, Ibaraki, Yamaguchi, Fukuoka and Kumamoto with 6 each, while the rest of prefectures all had less than five.

The number of bacteriological examinations made by these laboratories in 1937 were 4,446,393, of which those connected with the notifiable infectious diseases were 3,859,920 and those not connected therewith 586,473, showing an increase of 878,998 in the total number of examinations on the figures of the preceding year.

Medical Affairs

Medical Practitioners The total number of medical licences issued in 1937 was 3,359 (besides, 17 to foreigners), showing an increase, compared with the preceding year, of 40 licences (the number issued to foreigners decreased by 2). In the following table is given the number of persons to whom licences were issued, classified and compared with the preceding year's figures:

	1937	Compared with preceding year
Graduates of universities	1,816	64 (incr.)
Completed course in Government or public colleges of medicine	260	32 („)
Completed course in approved private colleges of medicine	1,276	58 (decr.)
Completed course in foreign colleges (including examination)	7	2 (incr.)
Passed examination	—	— („)
Total	3,359	40 (incr.)

The total number of medical practitioners at the end of 1937 was 61,799 (besides 35 foreigners), showing an increase over the preceding year of 2,093 practitioners (an increase of 5 among foreigners). The following table gives the number of medical practitioners at the end of 1937 classified and in percentages (the percentages for the preceding four years are also given for comparison):

	At the end of 1937	Percentage 1937	1936	1935	1934	1933
Graduates of universities	21,699	35.11	33.67	32.69	30.96	29.51
Completed course in Government, public or approved private colleges of medicine	30,127	48.75	48.85	48.61	48.80	48.33
Completed course in foreign schools (including examination)	73	0.12	0.13	0.12	0.12	0.12
Passed examination	9,434	15.26	16.41	17.49	18.82	20.42
Licensed on account of official career	29	0.05	0.05	0.06	0.07	0.09
In practice from before promulgation of the Law of Medical Practitioners	389	0.63	0.78	0.90	1.08	1.36
In practice within limited districts	48	0.08	0.11	0.13	0.15	0.17
Total	61,799	100.00	100.00	100.00	100.00	100.00

Digitized by Google

Of the above total number, those actually engaged in the diagnosis and treatment of patients were 54,481, being 88.16 per cent of the total.

The total number of those medical practitioners who were actually engaged in the diagnosis and treatment of patients at the end of 1937 was at the rate of 7.65 practitioners per 10,000 inhabitants (1,308 in habitants per physician). Next, if we consider the ratio of practitioners per 10,000 inhabitants in the prefectures, we find the highest ratio in Kyoto prefecture which had 15.66 practitioners, followed by Tokyo with 14.24, Osaka and Ishikawa with 10.61 each, and Miyagi with 9.03. Aichi with 8.78, and Chiba with 8.28 and the prefecture with the smallest ratio was Okinawa which had 3.04, followed by Fukushima with 4.55, Ibaraki with 4.56, Yamagata with 4.80, Akita with 4.92, Gumma with 4.96 and Tochigi with 4.96.

As to the distribution of medical practitioners between urban and rural districts, there were 12.54 practitioners per 10,000 of population in the urban districts while the corresponding ratio was 4.98 for rural districts.

Dental Surgeons The total number of licences issued to dental surgeons in 1937 was 1,132, being a decrease of 63 when compared with the preceding year. In the following table is given the number of persons to whom the licences were issued in 1937, classified and compared with the preceding year's figures :

	1937	Compared with preceding year
Completed course in Government or approved private dental colleges	992	97 (decr.)
Completed course in foreign schools (including those who passed examination)	6	—
Passed examination	134	34 (incr.)
Total	1,132	63 (decr.)

The total number of dental surgeons at the end of 1937 was 22,072 (besides three foreigners), showing an increase over the preceding year of 1,005 (number of foreigners remained stationary); the following table gives the number classified and in percentage (the percentages for the preceding four years are also given for comparison):

	At the end of 1937	Percentage 1937	1936	1935	1934	1933
Completed course in Government or approved private dental colleges	12,231	59.94	57.97	56.00	53.62	50.82
Completed course in foreign schools (including examination)	79	0.36	0.35	0.40	0.41	0.43
Passed examination	8,760	39.69	41.67	43.59	45.95	48.72
In practice from the time before the promulgation of the Law of Dental Surgeons	2	0.01	0.01	0.01	0.02	0.03
Total	22,072	100.00	100.00	100.00	100.00	100.00

Of the above number those who were actually engaged in practice numbered 20,187 which corresponds to 91.46 per cent of the total number of dental surgeons.

The total number of those dental surgeons who were actually in practice was at the rate of 2.83 per 10,000 of the population, and if we examine the ratio of the dental surgeons in prefectures, we find that the highest ratio was that of Tokyo prefecture with 6.21 per 10,000 inhabitants, followed by Osaka with 3.69, Kanagawa with 3.39 Aichi with 3.33, Fukuoka with 3.24, Kyoto with 3.14 and; the lowest ratio was that of Okinawa which was 0.70, followed by Iwaté with 1.29, Kagoshima with 1.44, Yamagata with 1.53, Toyama with 1.56, and Akita with 1.64.

As to the distribution of dental surgeons in cities and districts of the country the ratio was 4.85 for cities and 1.74 for districts per 10,000 inhabitants.

At the end of 1937, besides the above mentioned number of dental surgeons, there were 86 medical practitioners who specialized in dentistry.

Administrative Penalties upon Dental Surgeons In 1937, there were 8 dental surgeons upon whom administrative penalties were inflicted, and the penalties were the following :

Digitized by Google

Suspension of dental practice for	
2 months	1 persons
1 month	6 persons

(There was no case of licence cancelled).

Pharmacists The total number of pharmacists' licences issued in 1937 was 1,853, showing an increase when compared with the preceding year, of 208 licences. In the following table is given the number of persons to whom licences were issued in 1937, classified and compared with the preceding year's figures :

	1937	Compared with preceding year
Graduates of universities	52	34 (incr.)
Completed course in Government or public colleges of pharmacology	*483	117 („)
Completed course in approved private school of pharmacology	1,269	78 („)
Completed course in foreign school (including examination)	3	— (—)
Passed examination	46	21 (decr.)
Total	1,853	208 (incr.)

Note:—*Including the graduates from pharmacological departments attached to government or public medical universities.

The total number of pharmacists at the end of 1937 was 28,156 (besides 1 foreigner), showing an increase, compared with the preceding year's figures, of 1,424 (the number of foreigners remained stationary) ; and the following table gives the number classified and in percentage (the percentages for the preceding four years are also given for comparison) :

	No. at the end of 1937	Percentage 1937	1936	1935	1934	1933
Graduated from universities	363	1.29	1.26	1.22	1.23	1.32
Completed course in government, or public or private (designated) colleges of pharmacology	*17,212	61.13	58.71	56.34	53.26	50.02
Completed course in foreign school (including examinations)	33	33	0.12	0.13	0.13	0.14
Passed examination (including examination under former regulations)	10,548	37.46	39.91	42.31	45.38	48.52
Total	28,156	100.00	100.00	100.00	100.00	100.00

Note:—*indicates graduates from pharmacological departments of the government or public medical colleges or from the pharmacological departments attached to the government or public medical universities.

Of these pharmacists, (1) the number of practising pharmacists (those who were engaged in the dispensing of medicines in the pharmacy, those who were engaged in the sale of medicines and those who were engaged in the manufacture of medicines) was 18,214 (2) the number of those who being employed by hospitals or other dispensaries, were engaged in the dispensing of medicines was 3,152 and (3) those who were exclusively engaged in the sale of patent medicines numbered 1,-712. Those coming under (1) correspond to 64.49 per cent of the total number of pharmacists while (2) and (3) represented 11.19 and 6.08 per cent respectively.

Pharmacies and Traders in Medicines Pharmacies. The number of pharmacies at the end of 1937 was 13,066, of which 12,759 were run by pharmacists and 307 by non-pharmacists, showing an increase, when compared with the preceding year, of 331 pharmacies run by the pharmacist and 90 pharmacies managed by non-pharmacists.

Traders in Medicines. The total number of persons engaged in the sale of medicines at the end of 1937 was 30,-922, showing an increase of 284 persons over the preceding year ; among them, the qualified pharmacists who were engaged in the sale of medicines without

Digitized by Google

opening pharmacies numbered 735 and druggists 30,187. Of these druggists those who were qualified to deal in designated medicines numbered 4,326, of which those employing pharmacists were 2,338, those coming under the provisions of Art. XXXVII, Item 4 of the "Regulations for the Trade in Medicines and the Handling Thereof" were 79 and those coming under the second clause of the supplementary provisions of the same regulations were 1,909.

Medicine-Manufacturers. The total number of medicine-manufacturers at the end of 1937 was 4,074, being a decrease of 144 over the preceding year. Of these manufactures 1,123 were pharmacists, 1,300 those who employ pharmacists, and 1,651 neither pharmacists nor those employing pharmacists.

Midwives The total number of midwives at the end of 1937 was 61,732 (besides two foreigners), showing an increase of 765 (no change in the number of foreigners) over the preceding year; they may be classified into 5,740 persons who completed the course in designated schools or training institutes, 53,091 who passed the examination, and 2,493 who have been in practice from time prior to the operation of the Midwives Regulations, and 407 who practise in limited districts.

Distribution of Midwives The total number of midwives was at the ratio of 8.66 per 10,000 inhabitants, being a decrease of 0.02 from the preceding year; as to the distribution of midwives between urban and rural districts of the country, the ratio was 11.01 in the urban districts and 7.39 in the rural districts per 10,000 inhabitants, showing, when compared with the ratio in the preceding year, a decrease of 0.37 in the urban districts and an increase of 0.08 in the rural districts.

Nurses The total number at the end of 1937 of nurses who had obtained licence from the prefectural offices was 124,402 (of which 4,553 were under-nurses) showing an increase of 10,415 over the preceding year (the number of under-nurses increased by 709). The ratio of the above total number to 10,000 of population was 17.46, showing an increase of 1.24 over the corresponding figures of the preceding year.

The number of male nurses at the end of 1937 to whom licences had been issued by the prefectural offices was 295, showing an increase of 50 over the figures of the preceding year.

Acupuncture, Moxicautery, and Shampooing The following table gives the number of persons engaged in acupuncture, moxicautery, and shampooing whose licences had been issued by the prefectural offices at the end of 1937.

	Not Blind			Blind		
	Males	Females	Total	Males	Females	Total
Acupuncture	2,597	575	3,172	1,381	315	1,696

In the following table are given the capacity for admitting patients and the number of patients admitted in 1937 to these hospitals :

Patient Admitting Capacity	11,548
Of the above Capacity:	
For infectious diseases	802
„ tuberculosis	327
Number of Patients:	
Remaining from the preceding year	4,937
Admitted this year	119,512
Discharged	108,771
Died in hospital	9,747
At the end of the year	5,931
Aggregate number of in-patients treated each day	2,832,178
Average capacity per hospital	92.38
Average number of in-patients per hospital	995.59
Average number of days a patient stayed in hospital	22.76

Private Hospitals (Charity Hospitals, Tuberculosis Hospitals, Insane Asylums and Leprosaria excluded). The total number of private hospitals at the end of 1937 was 2,907 (of which 95 had been established by the public juridical persons and 8 by foreigners), which when compared with the figures for the preceding year, shows an increase of 20 hospitals.

The following table gives the number of these hospitals in urban and rural districts according to their capacity of admitting patients :

	Cities	Towns	Villages	Total
With capacity for more than 10	1,387	593	187	2,167
„ „ „ „ „ 30	263	117	37	417

Average number of days a patient stayed in leprosarium	296.70	304.41	271.97	284.76

Hospitals for Prostitutes At the end of 1937 there were 117 hospitals for prostitutes and the total capacity for them was 4,933 (of which 14 were the infectious diseases rooms). Compared with the preceding year, there was a decrease of 3 in the number of hospitals and of 133 in admitting capacity. The number of patients who had remained over from the preceding year in the hospitals was 1,362 and those who entered them in 1937, 53,622 making a total of 54,984 (of which 378 were clandestine prostitutes admitted under the provisions of Art. III of the Administrative Execution Law).

The following table gives important ratios respecting facts connected with the above-mentioned hospitals for prostitutes:

Average capacity per hospital	42.16 patients
Average number of patients admitted per hospital	469.95 "
Average number of days a patient remained in hospital	17.51 days
Average number of days a clandestine prostitute remained in hospital	26.74 "

Infectious Diseases Hospitals, Isolation Wards, and Isolation Houses (Established under the provision of the Law for the Prevention of Infectious Diseases). The total number of infectious diseases hospitals at the end of 1937 was 1,010, (a decrease of 30 hospitals from the preceding year), consisting of 119 established by cities, 726 by towns, villages and other similar public corporations, and 165 established by town or village associations or other similar associations. The admitting capacity of these hospitals was 23,255 in total (a decrease of 128 from the preceding year), making an average of 23.02 per hospital (an increase of 0.54).

The isolation wards at the end of the same year numbered 7,044, (a decrease of 203 from the preceding year) consisting of 63 established by cities, 6,560 by towns, villages or similar public corporations, and 421 by the town or village associations or similar associations: and the admitting capacity in these isolation wards was 69,246 in total, (a decrease of 1,125 on the preceding year, the average per ward coming to 9.83 (an increase of 0.12).

The total number of isolation houses at the end of 1937 was 66, (a decrease of 3 from the preceding year) of which 8 were those established by cities, 56 by towns, villages or similar public corporations, 2 by the town or village associations or similar associations. The estimated total capacity of these isolation houses was 1,699 (a decrease of 59 from the preceding year) the average capacity per house coming to 25.74 per-

sons (an increase of 0.26).

At the end of 1937, there were 47 disinfecting stations (established under the provision of the Law for the Prevention of Infectious Diseases), showing no change in their number with that of the preceding year.

Medicines The total number of persons who have reported in 1937 to the respective prefectural offices of the manufacture, importation and sale of medicines and preparations not to be found in any pharmacopoeia was 687 and the number of medicines reported 2,630, showing, compared with the preceding year, an increase of 15 persons and a decrease of 340 medicines.

In the tours of inspection made during 1937, 19,954 places (a decrease of 2,208 when compared with the preceding year) were visited; and the following table gives the places visited and the results of the inspection:

	No. of places visited	No. of places visited per 100 places to be visited	No. of deleterious medicines discovered per 100 places visited		No. of violators of the regulations punished per 100 places visited
			No. of places	No. of medicines

Total	19,954	17.72	24.41	47.59	0.72

Patent Medicines The total number of patent medicine traders at the end of 1937 was 43,427, showing an increase of 684 compared with the figures of the preceding year. Of this total number, 12,617 were pharmacists, 3,370 medical practitioners and veterinary surgeons, 3,010 those persons who employ pharmacists, 16,784 those persons who come under Art. XXIV of the Patent Medicine Regulations and 7,570 those who come under Art. XXV of the same law, while there were 73 who were engaged exclusively in the importation and sale of patent medicines.

At the end of 1937 the total number of patent medicines for which permission for manufacture or importation was given was 387,510 (of which 171 were imported), showing an increase of 10,507 when compared with the figures of the preceding year, (permissions for importation decreased by 22).

Patent medicines manufactured or imported in 1937 amounted to ¥108,150,609 (of which ¥670,002 represents foreign imports and the territories), showing an increase of ¥13,613,817 which compared with the preceding year (the amount of importation increased by ¥102,426), and if we compare the amount of the manufacture and importation combined to the population in that year the ratio is ¥1.52 per capita, being an increase of 17 sen compared with the preceding year.

CHAPTER XXXIII

PROGRESS OF SCIENCE

Geology and Geography

On Some Features of the Meeting of Arcs in the Japanese Archipelago

By Katumi Motizuki

Professor of Geology, Fourth Higher School, Kanazawa. (Communicated by T. Tsujimura.)

Introductory The Japanese festoon islands, lying between the continent of Asia and the Pacific Ocean, consist of several arcs. They are divided into the following:

(1) The Taiwan (Formosa) arc which continues from Taiwan southward.

(2) The Koreo-Ryukyu arc consisting of the Ryukyu Islands, Kyushu, and Korea.

(3) The Honshu arc: Kyushu, Honshu proper, Hokkaido, and Sakhalin.

(4) The Chishima (Kurile) arc: Hokkaido, the Chishima Islands, and Russian Kamtchatka.

(5) The Shichito-Mariana arc: the Shichito, Bonin, and Mariana Islands.

A short explanation about some of them is thought to be necessary. Korea has so far generally been excepted from the continuation of the Ryukyu arc, but the form of Korea is undoubtedly due to the younger orogenic movement that established the gigantic Koreo-Ryukyu arc. The Honshu arc has been usually treated as two arcs from the geological point of view: the South-western Japan and the North-eastern Japan. The present arc, however, has a very regular outline, the focus of which lies off the coast of the neighbourhood of Vladivostok; and the Hokkaido-Sakhalin system corresponds to a tangent extending northward from this arc. To bisect such an arc seems to us unnatural, at least morphologically speaking.

It is certain that these arcs were finished by the younger orogenic movements, the remnant of which is manifested to us in the earthquakes and volcanic phenomena of the present time. B. Koto gave the name "peri-Tung-hai (East China Sea) Movement" to the one which caused the Koreo-Ryukyu arc); the writer will use for the other arcs the following names: the "peri-Japan-Sea movement" for the Honshu arc, the "peri-Ochotsk movement" for the Chishima arc, and the "peri-Philippine-Sea movement" for the Shichito-Mariana arc.

Linking and Crossing of the Arcs The mode of connection in these arcs is not so simple. The connection of the Ryukyu and Honshu arcs has been recognized as linking or Flankenkettung. About the relation between the Honshu and Shichito-Mariana arcs, there has so far been no fixed opinion.

The middle portion of Honshu, corresponding to the boundary between the North-eastern and the South-western Japan, which have respectively different geological characters, was formerly the subject of vigorous controversy; E. Naumann notices that this part is occupied by a great depression grosser Graben der Bruchregion or "Fossa magna," and T. Harada recognizes that the two wings of Honshu arc meeting there in syntaxis. Lately S. Tokuda, laying stress upon the diagonal elevations en échelon, explained the interference of the peri-Philippine-Sea (Tokuda's South-Japan-Sea) orogenic movement with the old body of the Honshu arc.

The peri-Philippine-Sea movement which caused the Shichito-Mariana arc with a pretty échelon structure, made on Honshu a zone of elevation composed of mountains en échelon, as already found by S. Tokuda: viz. the zone made up of the Izu peninsula, the mountain ranges of Akaishi, Kiso, and Hida. Most of these have the character of titled blocks with steep fault-scarps facing eastward, which remind us of the physiographical feature of the Korean peninsula. The writer will add the Noto peninsula to the above-mentioned elevations.

Recently there has been discovered a great bank called Yamato (the "Notoid" bank according to B. Koto) off the shore of the Japan Sea. It is almost certain from materials dredged from its bottom that the Yamato bank was an island or great peninsula with Noto-

Digitized by Google

like outline during a young geological age—perhaps Pleistocene. The crossing of the Shichito-Mariana and Honshu arcs should be admitted from the established hypothesis that a land existed in the direction which the Shichito-Mariana arc is running. That the zonal structure seen in both wings of the Honshu arc is broken at the central portion of this arc, may be better regarded as the disturbances by the peri-Philippine-Sea movement which crossed the Honshu arc. In the south-western part of the Japan Sea, in clear contrast to its remaining part, the relief of the sea-bottom is complicated because of the prolongation of the peri-Philippine-Sea movement and its approach to the Koreo-Ryukyu arc.

The interesting outline of the Noto peninsula shows us that there two orogenic movements conjugate with one another. The belt of islands off the shore of the Japan Sea, one of the elements of the zonal structure of the two wings of Honshu, viz. Oki, Sado, etc. besides a number of peninsulas such as Oga and Shimane, is the most striking feature of the inner side of Honshu in contrast to the outer. Connecting the elevations caused by the peri-Philippine-Sea movement and the belt of islands off the shore of the Japan Sea, a remarkable peninsula, Noto, came into existence. Towards the end of Noto we see a closer relation to the Honshu arc, speaking morphologically as well as geologically. The control of the peri-Japan-Sea movement in recent ages seems more powerful than that which caused the Shichito-Mariana arc, at least in the inner side of Honshu. And this fact likely explains why the land, which is proved by Yamato bank to have existed, disappeared.

Intimacy and Detachment of the Arcs When an arc meets with another, there can be distinguished several distinct features as to the relation between their limbs. In Hokkaido, the Sakhalin-middle-Hokkaido system of the Honshu arc is intimately joined with the Chishima arc, while the remaining portion of the Honshu arc is so removed from the Sakhalin-middle-Hokkaido system that the middle Hokkaido depression and a great embayment from Cape Erimo to Shiriya lie in between and this island itself shows, as a whole, a peculiar outline. Here the Sakhalin-middle-Hokkaido system and the Chishima arc are to be said "intimate," while north-eastern Honshu along with south-western Hokkaido is "detached" from this connection.

At the central mountains of Hokkaido where the two arcs join, the geological structure is undoubtedly concordant with the Honshu arc, though S. Tokuda recognized the penetration of the Chishima arc therein. In such a case the Honshu arc is called "dominant," the Chishima arc "recessive," from a structural point of view.

In Kyushu where the Honshu arc and the Koreo-Ryukyu arc meet together, the Ryukyu archipelago and the Honshu arc are intimate, while Korea is so completely detached that if frequently has no been treated as the elongation of the Ryukyu-Kyushu system. Generally speaking, the structure of Kyushu is concordant with the Honshu arc and discordant with the Koreo-Ryukyu arc, although the Ryukyu volcanic zone clearly penetrates Kyushu, and besides, there is found a "back-bending" of the structural trend-line as noticed by S. Tokuda. In this connection the Honshu arc is dominant and the Koreo-Ryukyu arc recessive.

The structure of Korea is under the control of the so-called Sinian and Liaotong trend—the former N.N.E. to S.S.W., the latter from East to West. Nevertheless, the outline of the peninsula shows the Korean trend, namely from North to South. It is said that the Sinian and Liaotong trend-lines were caused by an orogeny earlier than that which formed the Koreo-Ryukyu arc. The peninsula, upheaved as a great titled block by the latter orogeny, was torn possibly from peneplain, and turned the scarp of splinter-fault eastward. While thus a long peninsula came into being, the Kyushu-Ryukyu system, the remaining portion of this arc, linked intimately to the Honshu arc on one side, and fractures, now filled by the basaltic effusion, were formed between Kyushu and Korea. Even in the interior of Korea the outflow of the basalt took place along the so-called Chikugarei rift valley.

At the meeting of the Honshu and Shichito-Mariana arcs in the middle portion of the former, the relation is more complicated, and this is ascribable perhaps to the fact that the case is not a simple linking but the crossing of the two arcs as already mentioned. Moreover, it is thought that the old Honshu arc acted more resistantly against the oblique stress than in the other cases. The disturbed structure of middle Honshu seems to us more likely concordant with the Shichito-Mariana arc, and therefore the Shichito-Mariana arc is here to be called "dominant" and

Digitized by Google

Honshu arc "recessive."

It is unquestionable that the volcanic activities are vigorous where two arcs meet in a linking or crossing manner; namely, the volcanoes in Kyushu, middle Honshu, and Hokkaido. And we have the greatest number of earthquake epicenters in the sea-bottom lying in the outer corners of linkings or crossings; viz. in the vicinity of Cape Erimo of Hokkaido, the vicinity of Tokyo, and Iyonada. These three districts are known also as localities where gravity indicates anomalies.

Shadow of Linkings or Crossings The districts where volcanism is active are all facing the Pacific Ocean in an open manner, and without exception stand closely by very deep trenches; viz. the Chishima Islands, north-eastern Honshu, the Ryukyu Islands, the Shichito Islands, and the Mariana Islands. On the other hand, in Korea, which corresponds to the position of a shadow of linkings, the volcanic activity was insignificant in younger geological ages, and together with Sakhalin there have been very few epicenters of earthquakes and no active volcanoes. In the Honshu arc, south-western Honshu presents a low degree of the activities mentioned above. It is most clearly evident in the distribution of active volcanoes. These facts show that this portion of Honshu corresponds to a kind of shadow of crossing.

The contrast of shadow to the open portion is also distinct in Kamtchatka where a volcanic chain turns suddenly toward the Aleutian Islands. That Korea and Sakhalin, though they present arcuate forms, are generally treated as if they did not belong to the Circum-Pacific Orogenic Zone, shows nothing but the intensely detached and completely shaded portion of the Japanese arcuate mountains.

The specific character of the Circum-Pacific Region is running from the Aleutian Islands through Kamtchatka, the Chishima Islands, and north-eastern Honshu toward the Shichito-Mariana arc. This fact also has been proved by the petrographical studies of the effusive rocks. Secondarily, the endogenous actions again become powerful in Kyushu and the Ryukyu Islands. There is no doubt that the Philippine Sea bounded by the Shichito-Mariana arc is different from the true North Pacific Ocean as regards several physical properties. The former must likely have features of a marginal sea and the latter a true oceanic character.

The Cenozoic History of Western Hokkaido, with Special Reference to the Periods of Volcanism

By Takumi Nagao

(English). [Proc. Fifth Pacific Sci. Congr., Canada (1934), pp. 2461-2465.] Western Hokkaido differs stratigraphically from the main part of the island in the absence of the Mesozoic and Palaeogene formations. The Palaeozoic sedimentaries and granitic rocks are overlain by the Neogene and later sediments which are, however quite extensive. The table given in page 53 shows the stratigraphic succession, crustal movement and volcanism in the region.

The Kunnui, Yakumo and Kuromatsunai groups are folded and upturned by the pre-Setana disturbance and the Setana covers these groups as well as the basement complex. Late Tertiary is the time of orogenesis and volcanism

The Geologic Structure of Southwestern Japan and its Mesozoic Palaeogeography (Part 6)

By Teiichi Kobayashi and Yanosuke Otuka

(Japanese). [Jour. Geol. Soc. Japan, Vol. 44 (1937), pp. 822-836). The Chapter (12) is captioned as a glance at the deformation of the fundamental geologic structure completed by the Mesozoic disturbances. The origin of the median dislocation line and its development are discussed from various attitudes. Yabe once claimed that the line had first come to existence sometime between the end of Cretaceous and beginning of Tertiary period. Repeated researches in various areas in Japan, however, brought out the fact that the discordance between late Cretaceous and Palaeogene formations is not so considerable enough to imply such a disturbance. On the other hand it is ascertained that the tectonic line is covered by the Upper and Middle Cretaceous formations in Onogawa basin. Therefore the origin of the tectonic line should date back before Middle Cretaceous. On the contrary these are several evidences showing that the line has not existed before the Sakawa orogenesis. According it may be concluded that the tectonic line has first brought to birth in the deformation phase of Sakawa orogenic movement.

Several tectonic students maintained that the two orogenic zones of different history had been fused along this tectonic line. Kobayashi reached the attention upon the distribution of the Ryoke injection-gneiss in the inner side and the Sambagawa-Mikabu metamorphic rocks in the outer, both of which together reveal a complete lenticular shape in their distribution which is cut by the median dislocation line. Accordingly he insists that the two may represent the core of the Sakawa Orogen, and that the Ryoke is the pliomagmatic zone and the Sambagawa-Mikabu the miomagmatic one of the Sakawa Orogen.

Since the two zones of the Sakawa Orogen had been bisected by the dislocation in the deformation phase of the Sakawa orogenic movement and the median dislocation line brought to existence there, the line was deformed at least twice. The first deformation of the line took place in the interval between depositions of the Palaeogene of the Amakusa islands and the Miocene of Mt. Ishizuchi and the second one occurred after the deposition of the Ishizuchi Miocene.

As a result of these deformations the tectonic line becomes to take a somewhat sigmoidal curvature, strongly convex in the eastern half and gently concave in the western. Furthermore, the line has displaced by several flexures and faults as indicated by Hinaku, Onogawa and other lines, and thus the median dislocation line has taken such an echelon structure as one can see at present.

Past Glaciers and the Present Topography of the Japanese Alps

By Gakuro Imamura

(English). [Sci. Rep. Tokyo Bunrika Daigaku, Sec. C, Vol. 2, No. 7 (1937), pp. 1-61, 19 pls., 10 tab., 26 figs.]. The glaciation of Japan in the near past has

Digitized by Google

been a moot question among our geologists and geomorphologists. The author made the topographical observations in the Northern, Central and Southern Japanese Alps and gathered the evidences showing the past glaciation. They are described and discussed in two chapters, Descriptive and Systematic. The forms of cirques in Japan differ entirely from cirques in other parts of the world from the beginning. The gradient of the climatic snow-line of the Japanese Alps in the past measures $3\sim5\times10^{-3}$.

As to the climatic condition in the glacial period the author points out that a) the annual range of climatic elements (snowfall, evaporation, temperature, etc.) was greater formerly than it is to-day, b) the temperature was slightly lower than it is to-day, c) the amount of snow-line depression was rather small, its form irregular, its nature unstable, and its gradient steeper, and d) the influence of the winter monosoons was at least potent then as it is to-day.

Finally he concludes that detailed studies of the Japanese Alps have led to the conclusion that some of the prominent peaks were really glaciated in the latest geological age, although the numerous nivigational topographies resembling glacial forms puzzled the observer not a little. The peculiar distributions and characteristic forms of glacial topography have necessitated slight modifications in the height, gradient, and nature of the Quarternary climatic snow-line, and have led him to propose a working hypothesis in regard to climatic conditions during the Ice Age of Japan.

T. Kobayashi

Plants of the Japanese Islands extinguished in the latest Geological Age

By Seido Endo

(Japanese). [Botany & Zoology, Vol. 2, No. 9 (1934), pp. 1519-1532]. The following ten species of plants have practically died out in the Japanese islands exclusive of Taiwan with the end of Tertiary period, but are still living now in the mountainous region of Southwestern China, Southeastern Europe, Asia Minor or the United States of America.

T. Kobayashi

Species	Fossil locality	Distribution
1. Sequoia sempervirens Endl.	Sendai & its environs. Aizu Basin, Fukushima Pref.	Western Coast of U.S.A.
2. Taxodium distichum Rich.	Mogi, Prov. Hizen. Near Kobe.	Southeastern part of U.S.A.
3. Glyptostrobus pensilis K. Koch.	Sendai & its environs.	S.W. mountains of China.
4. Juglans cinerea L.	Hanamaki, Prov. Rikuchu. Aizu Basin, near Sendai	Eastern part of U.S.A.
5. Carpinus betulus L.	Taguchi-mura, Prov. Shinano.	Southeastern part of Europe
6. Ostrya knowltonii Coville.	"	Western mountains of U.S.A. (Arizona)
7. Fagus americana Sweet	Sendai & its environs Mogi, Amakusa islands etc.	Eastern part of U.S.A.
8. Liquidambar formosana Hance.	Mogi, Prov. Hizen. Taguchi, Uchiyama, Prov. Shinano	Southwestern part of China Taiwan.
9. Celtis occidentalis L.	Mogi, Prov. Hizen.	East part of U.S.A.
10. Planera aquatica Gmel.	Various districts in Japan.	Eastern part of U.S.A.

Vegetation of the Japanese Islands in the latest Geological Age

By Seido Endo

(Japanese). [Botany & Zoology, Vol. 3, No. 11 (1935), pp. 1955-1961]. Nine Japanese floras in different formations of the Cenozoic group include genera which are not inhabited in the Japanese islands (exclusive of Taiwan) at present, but all of them are still living in certain parts of the world. The number of the extinct genera (B), that is, its percentage (C) in the total number of genera in the flora (A), increases according to the age of the flora as tabulated below.

Digitized by Google

Fossil locality	A	B	C	Geological Age
Shiobara, Prov. Shimozuke	58	0	0	Pleistocene
Uchiyama, Prov. Shinano	30	1	3	Uppermost Pliocene
Mogi, Prov. Hizen	46	3	6	Upper Pliocene
Nenoshiraishi, Prov. Rikuzen	32	6	19	Lower Pliocene or Upper Miocene
Hiramaki, Prov. Mino	23	5	22	Miocene
Kokuni, Prov. Uzen	54	14	26	Lower Miocene
Kannonzawa, Prov. Echigo	37	9	24	Lower Miocene
Kita-aigi, Prov. Shinano	21	6	29	Oligocene?
Due, North Karaft	27	9	33	Oligocene
Estoru, South Karaft	20	7	35	Oligocene
Woodwardia sandstone, Prov. Ishikari	44	19	48	Upper Eocene

The Shiobara flora resembles the present flora in Central Hokkaido in the general aspect; Liquidambar is the only extinct genus in the Uchiyama flora which, however, is common in the Japanese fossil floras from Eocene to Pliocene; 3 extinct genera in the Mogi flora are still living in Southwestern China and the United States; the floral aspect of Nenoshiraishi is rather different from the recent flora of Japan in the inclusions of Sequoia, Taxodium, Glyptostrobus, Sassafras, Catalpa and Liriodendron which are living in Southwestern China and the United States.

Well preserved seeds of Liquidambar formosa are very common at Hiramaki. The flora of this locality may be contemporaneous with the Shirakawa flora found at Okuhata and Shirakawa pass, west of Kobe.

Bauhinia, Cercis, Comptonia, Laurus, and Protea are extinct members in the Kokuni flora. This as well as the Kannonzawa flora, both of lower Miocene age, indicate the warm climate.

The Kita-aegi flora contains Populus, Platanus and Sequoia which are common in the Palaeogene flora of Japan, but its exact age cannot be definitely determined.

The above mentioned Neogene floras contain some genera which are extinct in Japan but living in foreign countries. However the ratio of such genera to the total number of the genera in each flora does not exceed 30 percent. The ratio, however, attains to 33 percent in the so-called Due flora and to 35 percent in the Estoru. Taxodium, Sequoia, Buettneria, Liquidombar, Carpa and Nelumo are abundant in them.

In the flora of the Woodwardia sandstone the ratio is in fact 30 percent. Furthermore it is remarkable that this flora includes such tropical or subtropical elements as Sabal, Asplenium, Aspidium, Denstaedtia, Grewia, Nelumbo, Ficus, Musa, Liquidambar, Cinnamomum, Palirus and Buettneria.

Botany

Miscellaneous Notes on the East-Asiatic Uredinales with Special Reference to the Japanese Species—Notes on the Japanese Species of Uromyces

By Naohide Hiratsuka

(Japanese). (Jour. Japan. Bot. 13. 1937, 587-594, 729-747).

In the first of the two papers above mentioned, 11 species of Uromyces, 14 of Puccinia, 1 from each of the genera Hemileia, Malampsora, Chnoospora, Phakospora, Barcleyella are enumerated with their localities, etc.

In the second the history of investigation of Uromyces in Japan is described, and 73 species which were hitherto recognized in Japan are enumerated. A table indicating their distribution in the world is given.

On a large-grained Sterile Strain of Rice-plant and the Inheritance of Its Chimera

By Fuyuwo Kagawa

(Proc. Crop. Sc. Soc. Japan 9, 1937, 319-340, 2 text-figs. and 8 tables).

In the autumn 1934 six completely sterile rice-plants bearing large grains have appeared among the strain known by the Japanese name "Urasan". The author has isolated carefully several tillers of each mutant stock, and cultivated them in pots separately in a glass-house. In the spring and autumn

Digitized by Google

of the next year (1935), though generally they have shown the mutant character few of them were wholly identical to the original normal "Urasan" strain. Since all of them have been derived from the original mutant stock in the vegetative way (tilering) the production of normal strain denotes that in a certain portion of the mutant body the character of the normal strain has appeared in the chimerical way. It is to be noticed that though the plants showing the mutant character above quoted remained quite unchanged in the next year, many of them have borne besides sterile large grains few normal fertile ones, thus making such plants semi-sterile instead of completely sterile.

All normal plants just cited were submitted to natural pollination, and the offspring of the next generation were examined. The offspring produced by each of them were either all normal or in the ratio of 3 normal: 1 sterile. If we denote the normal plant by AA and the mutant by aa, the parents of such offspring should be either AA or Aa. Some normal plants were found to produce besides the normals a very few steriles, for instance, 712 normals and 8 steriles. The author thinks that in this case the number of steriles is too small for considering the parent stock as Aa, and consequently he is led to the hypothesis that this should be due to the occurrence of some few mutations A—a in the AA-stock.

Ecological Studies of the Vegetation of the Abukuma River Basin

By Kyozi Naohara

(Japanese with English résumé). (Ecolog. Studies 2, 1936, 180-191, 306-318; 3, 1937, 35-46, 12 text-figs. and 13 tables).

Abukuma is one of the great rivers in Northern Japan Proper. The destructive action of inundations occurs in its river basin usually once per year. The author distinguishes there three vegetation zones, viz. unstable, semi-stable and stable. The unstable zone, on account of inundations just mentioned, remains quite bare for the greater part of each year, though in the year, when the inundation had not occurred or when only a slight destruction had taken place, few plants may grow there (for instance, some species of Chenopodium, Polygonum, Cassia, Microlespedeza). The adjoining semi-sterile zone which is less disturbed by the inundation than the unstable is characterized by the occurrence of some sand-resisting plants, as Carex pumila and Imperata cylindrica var. Koenigii, which form a sand plant community. Sand and humus piled up there by the flood lead to the further invasion of some other plants, which gradually build up a proper river bed plant community in the stable zone, where Zoysia japonica grows vigorously, and becomes finally the dominant plant. The mode of plant succession just spoken was further proven by the author by means of the scores of permanent chart quadrates and belt transects marked there. During this process of succession the contents of fine sand and igneous loss increase considerably, the pH of soil becomes lower, the Ca-content decreases, phosphat and nitrate increase, especially the latter, when leguminous plants will grow there.

Notes of the Algal Flora of Manchoukuo I–IV

By B. V. Skvortzov

(With Japanese résumé by K. Okada). (Bot. Mag. Tokyo 51, 1937, 627-635, 677-688, 738-742, 783-791, 826-826, 9 text-figs.).

The first part refers to the midsummer phytoplankton of a marshy river branch in the Sungari plain near Harbin. Flagellatae 2 genera and 8 forms, Protococcales 5 genera and 12 forms, Desmidiaceae 3 genera and 4 forms, Diatomaceae 17 genera and 51 forms, Cyanophyceae 9 genera. Among 89 algae in all about 25% are new varieties and species, and many are those newly found in these regions. Trachelomonas scabra known hitherto from Australia and Venezuela, Nitschia holsatica known from Europe, and N. regula known from Tibet and Central Asia are cited as the most interesting records. All species are described.

The second part contains a list of algae from a single growth of Spirogyra collected near Harbin. In mucilaginous masses of Spirogyra 30 different algae were recognized, of which most are diatoms. The following new species are recorded as the most interesting forms: Stigeoclonium spirogyrae sp. nov., Tribonema tetrachlora, Oscillatoria Kavalchookiana and Navicula harbinensis. The description of all species follows.

The Entrance and Migration of Bacterium Solanacearum Smith in Tobacco Plants

By Wang Gee Vong

(Japanese with English résumé). (Ann. Phytopathol. Soc. Japan 7, 1937, 14-23, I pl. and 6 text-figs).

Inoculation experiments of Bacterium

Digitized by Google

solanacearum on tobacco plants executed by the author have shown that the infection take place through the wounds, never through stomata or water-pores. Stigma was infected, even not wounded. The above experiments were made with bacteria cultured on potato agar or decoction. Those cultured on milk were found even to be able to infect unwounded roots, being more virulent than those cultured on potato agar or decoction. In the infection of stem and leaves the bacteria entering them through the wounds occupy the xylem-ducts, and then grow outwards towards the surrounding tissues which are damaged severely. Bacteria are often seen in the cells of pich and cortex. Bacteria occupying the xylem were found to migrate a much greater distance downwards than upwards. The rate of migration is dependent on the temperature, being greatest at 40°C and smallest at 15°.

Physiological Studies on the Growth of the Paddy Rice Plant in Peat Culture, with Special Reference to the Peat Conditions and the Nitrogen Source

By Sennosuké Yamaguchi

(Jour. Fac. Sc. Hokkaido Imp. Univ. Ser. V.,4, 1937, 143-175).

Studies on the growth of paddy rice plants were carried out by the method of pot culture with peat, clayey loam, and coarse sand soils and their mixtures, using urea, urine, ammonium sulphate and sodium sulphate as nitrogen source. The following facts were ascertained. (1) The growth of rice plants depends upon the change of hydrogen ion concentration of the medium and upon the buffer capacity of the soil. (2) The buffer capacity of peat, clayey loam and coarse sand was largest in the case of the alkali titration; that of coarse sand was smallest and that of clayey loam showed a degree intermediate between them. (3) The local difference of pH-value according to the depth in the pot was most remarkable in clayey loam, smallest in peat, and in coarse sand it was similar to peat. (4) The hydrogen ion concentration was lowered by mulching of coarse sand or clayey loam on the one hand, and by manuring of urea, urine or sodium nitrate on the other. Such reaction change favours good growth of paddy rice plants, except the application of NaNo . (5) The bad growth of paddy rice plants in the higher acidic region in the peat or peat extract culture may be partly due to the harmful effects of humic acids in the molecular form or of organic substances in an active form, the amount of which depends mainly upon the hydrogen ion concentration of the culture solution.

On the Gametophytes of Some Japanese Species of Laminaria II

By Tiyoiti Kanda

(Sc. Papers Inst. Algol. Res., Fac. Sc., Hokkaido Imp. Univ. 2, 1938, 87-111, 2 pls. and 24 text-fig. groups).

The life history of Laminaria Yendoana, cichorioides, yezoensis, Kjellmanniella crassifolia and Chorda Filum, was traced by performing the culture. The alternation of generations—asexual zoospores male and female gametophytes—as well as the development of young sporophytes were thus ascertained. These processes are similar in all forms above indicated. The zoospores and the male gametophytes lack the eye-spot, except in the last of the species above cited. In all species of Laminaria examined by the author the oogonium consists of one or few cells, and the egg-cell is pressed out from the oogonium before fertilization. The male gametophytes are multi-celled, and each antheridium developed from a terminal cell of the thallus produces each one antherozoid.

The Species of Liagora from Japan

By Yukio Yamada

(Sc. Papers Inst. Algol. Res., Fac. Sc., Hokkaido Imp. Univ. 2, 1938, 1-34, 15 pls. and 22 text-figs.).

First of all, some short remarks are made on the anatomical details of the genus Liagora. The assimilatory filament in this genus is distinguished into two different types, the first being seen simply in the section Farinosae, and the second in all other forms. Two distinct types are also seen in spermatangia. In the one type they are produced around the ultimate cell of the assimilatory filament and form densely packed head-like clusters; this type is seen in those species with the assimilatory filaments belonging to the Farinosae-type (cf. above). In the second type the spermatangia are produced either on the ultimate or penultimate cell of the assimilatory filament in nearly corymbose manner. The carpogonial branches are also of two types. In the one they are evidently lateral on one cell of the assimilatory filament, while in the other they are lateral, subterminal or terminal. After fertilization the cystocarp is divided into two cells, usually by means of a horizontal cell-

Digitized by Google

wall, but sometimes by a longitudinal one.

An analytical key to the Japanese species of Liagora is given. Each species is described and illustrated. The following species are contained in this paper: Liagora orientalis Agardh, L. caenomyce Decaisne, L. robusta sp. nov., L. Boergesenii sp. nov., L. Setchelli sp. nov., L. japonica sp. nov., L. Segawai sp. nov., L. ceranoides Lamouroux, a pulverulenta (Agardh) comb. nov., b leprosa (Agardh) comb. nov., L. decussata Montage, L. farinosa Lamouroux, f. pinnatiramosa f. nov., L. pinnata Harv., L. clavata sp. nov., L. mucocissima sp. nov., L. formosana sp. nov.

Zoology

Graded Response of the Muscle of Japanese Giant Crab for Direct Stimulation

By Takeo Kamada and Haruo Kinosita

[Proc. Imp. Acad. of Japan, 13, No. 9 (1937), 1 tab. (374-377).]—On the motor nerve of the dactylopodite flexor of Macrocheira kaempferi two pairs of Ag-AgCl electrodes were set. By these electrodes the nerve was stimulated with 50 cycle current. The situation of the distal pair of the electrodes was settled at one place, but the other pair of the electrodes was sometimes translocated. The muscle was tetanized by the stimuli from the proximal electrodes, and then the second extra stimulus was applied by the distal electrodes. The latent time of that second stimulation was then determined. This value becomes larger according to the increase of the distance between the two pairs of the electrodes. From this result the authors discussed the possibility of occurrence of the difference in muscular contraction by the train of impulses developed in one and the same nerve fibre but of different discharging frequency.

K. Inoue

Preliminary Note on Experiments of Ooplasm Transfusion of Silk-worm-egg with Special Reference to the Development of Embryo

By Yositiro Umeya

[Proc. Imp. Acad., 13, No. 9 (1937), 378-380, 2 figs., 1 tab.]—The author is of the opinion that the development of wintering eggs might be forced to be retarded due to the insolubility of yolk, although the embryo itself is in the state ready for development. To establish his opinion, the author tried to exchange the ooplasm reciprocally between the wintering eggs and non-wintering ones. A small hole of about 0.2 mm in diameter was made in the centre of the egg, and then some ooplasm (with yolk) of about 20% of the volume of the egg was sucked out by means of a capillary tube, taking care not to injure the embryo. As soon as this operation was done successfully, reciprocal transfusion of removed ooplasm was made. The embryo in the wintering egg could develop when a proper quantity of ooplasm including soluble yolk from the non-wintering egg is introduced. But by transfusion of some ooplasm containing insoluble yolk from the wintering egg into the non-wintering egg the development of the embryo in the latter could not be checked. This latter case was explained in many ways from the author's stand point.

K. Inoue

On the Developmental Characteristics of the Silkworm Embryo

By Yositiro Umeya

[Proc. Imp. Acad., 14, No. 4 (1938), 141-144, 3 figs., 2 tabs.]—The rate of early development of the embryo, that is from the wintering stage to the elongated stage occupying about one-third the entire embryonic period, varies not only with the race of the silkworm, but with the season in which the eggs are laid. On the contrary the rate of later development, namely, from the elongated stage to the time of hatching, which takes up about two-thirds the entire embryonic period does not differ very much by such factors. The above mentioned phenomena were ascertained by the author experimentally. It ts interesting that the more retarded the development of the embryo in the earlier stage, the more accelerated it is in the later stage, resulting that the total period of embryonic development under constant temperature becomes almost the same, notwithstanding the season in which the egg are laid. The author regards this phenomena from the view point of the organism as a whole.

Sex-modification in a Semidifferentiated Salamander, Hynobius retardatus, Resulting from Implantation of Testis and Hypophysis

By Kin-ichiro Hanaoka

[Proc. Imp. Acad., 14, No. 4 (1938), 145-148, 3 figs.]—1) Implantation of adult hypophysis into larval salamander. In the normal development the testis begins to differentiate once in the female direction and reaches young ovarian stages, then the differentiation starts to male direction shortly before the metamorphosis. In the grafted larva the testis differentiates from the beginning into male direction as in sexually differentiated amphibians. The development of ovary was not affected by implantation. 2) Implantation of testis and hypophysis. The testis of the grafted host was slightly advanced for their age, but no further differentiation of testis occured at the stage of metamorphosis. Profound modification of sex, however, was found in the development of ovary.

K. Inoue

Observation on 'Thermo-Current' in Nerve

By Seiichi Okabé

[Jap. Jour. Med. Sci., III. Biophys., 3 (1935), 167-176, 2 figs., 2 tabs.]—The author studies the thermocurrent of the sciatic nerve of the toad. Its result confirmed the study of Varzâr. The only difference is that the nerve gives quiet consistent response up to 27°C, the warmer region takes invariably positive sign against colder portion. An optimal temperature is about 23°-24°C. It is remarkable that the thermo-current does not respond promptly to the change of temperature. This is made clear especially in the case of cooling.

K. Inoue

On the Difference of the CO^2-output of the Frog Tissue between Different Sexes

By Tyuziro Seto

(Japanese.) [Nihon Seiri. Z., 1, No. 6 (1937), 376, 2 tabs.]—The CO^2-output of the male muscle and other tissues is greater than that of the female. The male muscle contains larger amount of water than the female. The muscle immersed in half concentrated Ringer's solution gives out smaller amount of CO^2 per minute than the muscle in twice concentrated Ringer's solution. Measurement of CO^2 was performed by the Parker's method.

K. Inoue

A Contribution to the Knowledge of the Braconid Fauna of the Empire of Japan (Hymenoptera)

By Chihisa Watanabe

[Jour. Facul. Agr., Hokkaido Imp. Univ., 42, pt. 1 (1937), 1-188, 5 pls.]—In this paper 240 species have been arranged under 9 subfamilies. Of them 42 species are new to the fauna of the Empire of Japan and the following 30 are described as new to science: Bracon yakui, B. nipponensis, Spathius japonicus, Rhogas daisetsuzanus, R. oyeyamensis, R. lymantriae, R. Wadai, R. drymoniae, R. microculatus, R. sapporensis, Chelonus tosensis, C. moriokensis, Ascogaster epinotiae, Phanerotoma producta, Earinus jezoensis, Braunsia postfurcalis, B. matsumurai, B. antefurcalis, Microdus aino, Microtypus takeuchii, Microgaster takeuchii, M. coenonymphae, Microplitis theretrae, Streblocera nigrithoracica, Pygostolus septentrionalis, Leiophron antennalis, L. aino, Cardiochiles japonicus, Macrocentrus gigas and Phaenocarpa jezoensis. General discussion on the parasitism of the family is given and also host list is appended.

S. Kuwayama

Studies on the Post-embryonal Development of Hymenolepis diminuta. Part I. On Hatching of the Eggs of Hymenolepis diminuta

By Norio Narihara

(Japanese with English résumé.) [Taiwan Ig. Kw. Z., 36, No. 4 (1937), 713-731.]—The egg-shell is affected neither by artificial gastric nor intestinal juice when immersed therein up to twenty-five hours at a temperature of 38°C. The eggs which were immersed in the artificial gastric juice for from one to one and half hours and then transferred into the artificial intestinal juice did not show any change of their shell, when examined after 2-46 hours' immersion in the latter juice. The author found, however, that the shells are easily broken and oncosphaerae freed if the eggs thus treated are transferred into a small gum sac containing certain kind of medium and mechanical stimulation was applied by gentle crumpling of the sac with fingers. The eggs hatch out in the body of the intermediate host, Ephestia cautella, in the same manner as in vitro and the free oncosphaerae were frequently found in its parenchymal tissues 5 hours after infecton. Thus it might be concluded that as soon as the intermediate host ingests the eggs,

Digitized by Google

the shells are broken by the peistaltic action of the intestine. The oncosphaera on being freed from its shell takes up active, erratic movements which gradually slow down to normal before finally resting in a motionless position.

K. Morishita

Studies on the Tropical Rat Mite. Third Report. Its Biology and Control

By Nanzaburo Ohmori

(Japanese with English résumé.) [Taiwan Ig. Kw. Z., 36, No. 12 (1937), 2589-2608.]—The damage from this mite in Formosa was first reported by Morishita and Ohmori (1931). In the present paper the author described its growth, its blood sucking habits, the condition in which the eggs are layed, its span of life, its development in human habitats and the nature of its hosts. For its control he recommended the fumigation with the insecticide which consists of 20 or 25 parts of kerosene and 80 or 75 parts of petrol with or without 10 gm naphthalene.

K. Morishita

Physics

High Frequency Characteristics of High Resistances

By Takeo Akahira and Masao Kamazawa

(Japanese). [Bul. Inst.. Phys. Chem. Res., 16 (1937) 1393-1408]. Authors investigated the behaviour of high resistance at high frequencies which consists of conducting layer deposited and cut in a spiral form on porcelain tube or rod. The equivalent circuit of a high resistance can be represented by the two components, the resistance and the capacitance connected in parallel, and the magnitudes of these two components change with the frequency. The thickness of the conducting layer is usually so small that the increase of resistance due to the skin effect is out of question even at the very high frequency. The inductive reactance of such a resistance is also negligible compared with its direct-current resistance even at the frequency of 100 megacycles per second. When the resistance is prepared by a deposit on porcelain tube, also having similar deposit on the inside of the tube, which may be disconnected from that on the outside, this inner deposit becomes effective at the higher frequencies through the capacities between the both side layers and decreases the resistance remarkably. With regards to the resistance without inner deposit the decrease of equivalent resistance at a high frequency is probably attributable to the stray capacity, which is naturally resulted from such a complicated electric field near terminals. In order to remove this stray capacity, in other words, to make the electric field uniform two parallel plate electrodes are used as the terminals. And thus, the high resistances with excellent characteristics have been obtained, for instance a resistance of 2 megohms which shows no change of resistance at 10 megacycles per second.

Authors

A New Attachment Theory of The Ionosphere

By T. Tukada

[Rep. Rad. Res. Japan, 7 (1937), 121-144, with 4 fig.]. It is theoretically shown that electrons in the ionosphere disappear mainly by attachement to molecules or neutral atoms instead of by recombination. The negative ions produced by electron attachment are shown to eject electrons as a result of the photoelectric effect of sunlight. These disclosures have eliminated the various faults existing in the concepts of the past attachment theory and have made possible the explanation of phenomena that could not be explained by the recombination theory. It has also become possible to explain the seasonal variations of the F region without resorting to the assumption of such great differences of temperature as are necessary in the recombination theory. A part of the discussion deals with the atomic oxygen content of the upper atmosphere and also touches upon the ionization of the E, F^1, and F^2 regions. The value of the conclusions based on this new attachment theory, however, can only be established after further experimentation.

Comparison of Field Intensities of Short Waves Receives Simultaneously from European Stations at Two Different Points in Japan

By Takesi Amisima

[Rep. Rad. Res. Japan, 7 (1937), 75-89, wih 18 fig.]. In the present paper,

Digitized by Google

the writers deal with the results of extensive measurements that were carried out in Japan with the object of comparing the field intensions of short waves simultaneously received from European Stations at two separated sites in Japan during the period from January to August, 1935. The short waves were specially transmitted from Europe for the purpose of these measurements. The receiving sites were separated only 440 km from each other, the one being in the suburb of the city of Akashi some 50 km west of Osaka, and the other near the Fukuoka Receiving Station of the Japan Wireless Telegraph Company Ltd., about 25 km north-west of Tokyo. The waves received at these two sites may, therefore, be supposed to have propagated along virtually the same path, although those received at Fukuoka took a path slightly more northern than those received at Akashi, assuming that all waves propagate along a great circle path as usually accepted. A method of measurement practically unaffected by differences in local conditions peculiar to these sites was adopted for the investigation. The following are some of the most important conclusions from the results of these measurements: 1. Considerable differences were found between the signal intersities received at these sites, notwithstanding the very slight difference in the two wave paths. 2. An additional increase in attenuation in bd was observed in the waves from Dorchester, England, to Fukuoka on magnetically disturbed days, which was roughly twice as large as that in the case of waves from Dorchester to Akashi. Judging from the geographical distribution of auroral displays on the wave path, it does not seem a very difficult matter to estimate this attention. 3. The variation in signal intensities on the Dorchester-Akashi route was much less than that on the Dorchester-Fukuoka route, although it was observed to be much more than that observed on wave paths through lower latitudes. Sometimes an abrupt increase in signal intensity of about 25 ab, lasting only a few minutes on the Dorchester-Fukuoka route.

Intercomparison of Frequency Standards by means of Modulation Emission—Eighth Report of The Sub-Committee for Frequency Standards

By Ryotaro Mitsuda and Keikitiro Tani

[Rep. Rad. Res. Japan, 7 (1937), 17-20, with 2 fig.]. The present paper is a report of test results, obtained in the latest comparison (the eighth one of this kind) of the frequency standards maintained independently at the Electrotechnical Laboratory, the Naval Technical Research-Department, the Military Scientific Laboratory, and the Iwatsuki Radio Receiving Station, all in Japan. The comparisons were made during the period from November 18 to 20, 1936, by simultaneously measuring the modulation frequency of a radio wave emitted from the Kemigawa Transmitting Station. The values of modulation frequency measures by each laboratory agreed well within a maximum difference of 3 parts in ten million.

Authors

Photoradio Development in Japan

By Daitaro Arakawa, Atsushi Kimpara and Takesi Amisima

[Rep. Rad. Res. Japan, 7 (1937), 207-213 with 9 fig.]. This paper briefly describes the recent developments in picture transmission by wireless in Japan. Preliminary experiments were carried out at first between Taiwan (Formosa) and Tokyo, a distance of 2000 km. The advantages and disadvantages of time and amplitude modulation were compared in detail, and critical, quantitative studies interference, atmospherics, and fading (especially selective fading). During the Olympiad in the summer of 1936, a long distance transmission experiment was performed between Berlin and Tokyo, and fair results were obtained, notwithstanding the unfavourable radio transmission paths lying near the north pole. Since then efforts were made to improve the screen frequency synchronising mechanism, high-frequency keying device, and to ascertain the most suitable screen frequency, etc. In the beginning of 1937, other experiments were conducted between London and Tokyo, and between San Francisco and Tokyo. The latter experiment brought about somewhat improved results.

New Automatic Telegraph Transmitters

By A. Kuroda and S. Iwai

[Res. Electrotech. Lab., 409 (1937), 1-28, with 17 fig.]. It has been well known that the various disadvantages of automatic telegraph transmitters in the past, such as the instability of adjustment, chatter-

Digitized by Google

ing of the transfer contacts, arcing, etc., have been largely due to the type of construction of the transfer contacts. With the aim of eliminating these disadvantages and at the same time obtaining high-speed transmission, an automatic transmitter employing a rotating drum type of contact was constructed for test purposes. A spring contact was arranged to slide over a rotating drum which contained both mark and space contacts, and the point of contact was shifted in accordance with the letters sent. By this means, the rebound due to the striking of contacts was eliminated, and hence chattering was prevented. The elimination of rebound also obviated the need for adjusting the pressure of the jockey in accordance with the communication speed. Since a spring contact needed only to be strong enough to maintain contact with either the mark or space contact, there was little variation of adjustment, and the apparatus could be operated continuously over long periods of time. Besides the above apparatus, another type of automatic transmitter was constructed with the object of conserving paper slips and unifying the perforator. This transmitter employed a slip perforated by the reversal code and was used in the transmission of Morse code. Since one of the most important factors in his special type of transmitter is the mechanism of controlling the travel of the paper slip for the transmission of a dash, a differential driving gear was employed as means of control, and the rotating drum described above was utilized for the transfer contact. This report give a detailed description of the construction, operation, and behaviour of these two experimental transmitters; and for reference, the various types of automatic transmitters used heretofore have been briefly outlined at the end of the report.

Geoid and Crustal Deformation in the Kwanto District

By Yukio Kawabata

[Geoph. Mag., 10 (1936), 89-110.]. Through the revision of the precise levels after the great Kwanto earthquake of 1923, were worked out the vertical displacements of banch-marks that had been previously laid down there. Certain statistical correlations were noticed, that would suggest that change of geoid occurred at the same time, but its absolute values could not be determined. To ascertain the meaning of these changes, a rough examination was made of the extent to which isostatic compensation had been attained in these region, the result thus obtained affording a suggestion that the theory of isostasy holds even in Japan, but in a very different manner as compared with that obtained elsewhere. At any rate, in Kwanto and vicinity, the depth of compensation seems as a whole to be very shallow, especially in the western part of the area, including the Izu Peninsula and Suruga Bay, the depth being very shallow as compared with the eastern part that faces to the Pacific.

Sudden Rise of Air-Temperature near Ground During Night at the Basin of Kyoto

By Tatutosi Takahasi

[Meteorological Notes No. 1. Met. Res. Inst., Imp. Univ. of Kyoto, July, 1936] (Japanese.) Three examples of sharp rises of temperature at low level but not at high level are illustrated and explained by autographic records as the consequence of sudden displacements of surface cold air accumulated near the ground. The first example, which occured at the passage of a warm front and which shows a sharp rise 5°C and how the ordinary warm front is modified by the preexistence of cold air lake, is illustrated by temperature-height curves. The distribution of sudden rises which is mainly horizontal, is illustrated by the second example which took place at the passage of the trough line of a cyclone; and the third example is selected to show a different type which appeard during an anticyclonic cold clear night. Some statistical results are appended at the end of this paper.

Vibrations of the Keep of Nagoya Castle due to Earthquake and Wind Pressure

By T. Saita

(Japanese.) [Bull. Earthq. Res. Inst., 16 (1938), 145-154.] In our country great and tall wooden buildings are those of Buddhist and castle, namely, a five-storied pagoda, the great gate of a Buddhist temple and a keep. These buildings are well spoken of a safety against earthquake shocks while other low buildings are almost demolished. These is no investigations for these buildings.

The writer is at present engaged in observing the vibrations of a pagoda in Tokyo and its results are not yet ready for publication. In this paper are given the results of observations which have been done by the writer in the first place for the vibrations of the famous keep of Nagoya castle during earthquake and wind blows. From the observations the writer found that the acceleration at the upper floor of the keep is about 1/3 of the ground and decrease of acceleration at upper floor depends on the keep and that of its ground.

The writer believes that the above statements are applicable to the fact the pagoda and other tall buildings are well proof against earthquakes.

Author

General View of Hot-springs in Beppu City, I. and II.

By Beppu Geophysical Institute.

(Japanese.) [Tikyubuturi (Geophysics) 1 (1937), 20-27; 267-284.]

1. The sources of hot baths in the City of Beppu are 12 natural springs and about 800 boring wells. Investigation of the circumstances and conditions of each individual well in the city were carried out by members of the Beppu Geophysical Institute first in 1924, and again in 1933. The general results of the investigations are described. (Most of the wells are of the depth of 40-60 metres. Wells are being deeper year by year.)

2. The temperature and the flow were measured on about 700 wells in September and October in 1924, and in July and August in 1933. Mean values of temperature and flow are 53°.38C and 13.724 L/min in 1924 and 54°.06C and 17.263 L/min in 1933.

3. Chemical analysis of mineral water from 107 wells shows that there is no great difference in their contents. The temperature, the flow and mean values are as follows.

Max. temp.	Max. flow	Temp. of max.	Flow frequency	Total flow in the city
68.6°C	851.57L/m	57°	8-12 L/m	16.32×10^3m³/day
71.5	847.62	57	8-12	18.79 „

	Total ppt.	SiO_2	$Fe^{...}$	$Al^{...}$	$Ca^{..}$	$Mg^{..}$	$K^{.}$	$Na^{.}$	Cl'	SO''_4	HCO'_3	CO_2
In gr./L.	1.035	0.1816	.0031	.0024	.0742	.0393	0.179	.1772	.2411	.0584	.5085	.2358
In ton/day In whole city	19.68	3.450	.059	.045	1.410	.747	.340	3.365	4.580	1.214	9.665	.449

The springs in the whole city produce 2.7×10^{11} cal of heat and 7,200 tons of precipitation in a year.

4. Annual variations and secular variations of the temperature and the flow of springs in Beppu are concluded from the examination of the data of continuous observations on 63 wells for a year and on 8 wells for 10 years, with tables showing the mean values for each month of all wells. Annual variations of flow are distinct: a maximum value in September and a minimum in April. The temperature of spring water remains almost constant, the amplitude of the annual variation does not exceed 2°C. Variations of the temperature and the flow indicate a slight positive correlation as a whole, but this does not hold for individual wells.

The amounts of secular variations are far greater than the amplitude of annual variations. Mean annual values for 8 wells are as follows.

Year	1925	1926	1927	1928	1929	1930	1931	1932	1933	1934	1935	Mean
Temp.	53.4	53.0	55.8	55.7	55.5	55.3	No Obs.	53.3	52.7	52.6	52.9	54.0
Flow	15.39	12.39	12.68	13.36	12.82	11.74	No Obs.	10.96	9.01	9.29	11.75	11.94

Digitized by Google

5. The structure of the ground under the city of Beppu is discussed on the basis of soil samples from 25 boring wells distributed in the city. It is realized that the ground is composed of many strata of various sorts of sand, pebbles and clay soils of alluvial deposit, containing between them rich mineral water. The most remarkable feature is that a dense group of impervious layers of the thickness of nearly 100 metres extends under the lower part of the city. The upper layer of this group lies at the depth of about 50 metres in the middle part of the city and it slopes from the SW to the NE-direction. The hot spring water flows out from layers of various depths through boring wells.

Report of the Expedition Sent from the Department of Astronomy in the Tokyo Imperial University for the Observation of the Total Solar Eclipse of June 19, 1936

By Yusuke Hagihara, Masaki Kaburaki and Kuniji Sato

[Ann. Tokyo Astr, Obs. 2nd Sex. 1 (1938), 91-150, with 3 plates.] The first aim was to study the light distribution over the corona by the light of the photographic region and also of the visible region. The second aim was to get some slitless spectrograms of the corona and of the chromosphere. The third aim was to take the photographs of the Sun in its partial phase.

On account of the unfavorable weather condition the second aim was in failure. Twenty-two photographs of the Sun in its partial phase were taken and were handed to the Tokyo Astronomical Observatory for the reduction.

Several photographs of the corona were taken through a yellow filter with a Merz's 7-inch visual telescope in equatorial mounting. The density over the three plates were measured, together with the intensity-scales taken by the light of a Hefner lamp. The isophotes for the corona were drawn. The intensity-decrement along the streamers was shown to vary in the inverse 5.5-th power of the distance from the centre of the Sun's disc.

With a Dallmeyer 8-inch photographic camera in equatorial mounting three photographs of the outer corona were taken. At the same time several intensity-scales were obtained by the light of the corona itself with a special apparatus designed on purpose for it. The reduction of the plates was carried out by inventing a special method which we call the chain method. Corrections for sky-light and for fogging were applied. Isophotes were drawn and the intensity-decrement along the streamers were shown to vary in the inverse 3.5-th power of the distance from the centre of the Sun's disc.

With the special apparatus just mentioned several intensity-scales were taken by the light of the full Moon with the same exposure time as for the intensity-scales taken by the corona. The luminosities of the corona and of the full Moon were compared by the chain method. It was found that the luminosity of the corona was 2.3 times as bright as that of the full Moon.

The distribution of the intensity of halation due to the photographic images of some simplified forms, such as in the form of a pin-hole, in the form of a straight line and in the form of a circular ring, was studies by laboratory experiment. The result was applied for eliminating the effect of halation in the coronal photometry. The true distribution of the relative intensity was shown to be derived from the apparent distribution by means of a Fredholm's linear integral equation.

The effect of sky-scattering for the celestial bodies in the forms of a circular ring and of a circular disc was computed theoretically. This result for the circular disc was applied for determining the coefficient of sky-scattering from a photograph of the full Moon taken by screening the Moon's image on the plate. Then the effect of sky-scattering on the distribution of the intensity of the corona was removed likewise by solving a Fredholm's integral equation.

From the intensity-distribution over the Moon's disc on our eclipse-plates the amount of the reflected light from the Earth was determined and it was seen to be in second with Danjon's estimate of the luminosity of the new Moon.

On the Results of Re-examinations of the Spectrogram Obtained at the Hokkaido Eclipse of June 19, 1936

By Rikichi Sekiguchi

[Tokyo Astr. Bull., Nos. 280-282, (1938).]. This is a short note mainly dealing with the reality of the nebular lines λ6 548 and λ6 583 (NII forbidden lines) found by the author at the mentioned occasion, and drawing attention to the multiple structures of the red lines λ6 374 and λ6 776. The author emphasizes the possible relationship of those nebular lines to the disturbed region of the Sun's marginal part as manifested by the groups of flocculi and faculae. As a result of cautious survey of the red part of the spectrum the author found a number of unknown emission lines, being confirmed by microphotometric traces. Their approximative wave length are: 6 767 (violet component of λ6 776), 6 535, 6 528 6 502, 6 449 6 416, 6 381 (red component of λ6 374), 6 374, 6 364, 6 360, 6 316, 6 299, 6 262. The line λ6 364, the violet components of λ6 374, and the line λ6 299 are respectively so closely situated by the well known nebular lines, λ6 364 and λ6 302 (identified by Bowen by to OI forbidden lines). The author is tempted to identify them each other. Also the identity of the line λ6 381 to the line λ6 381 to the line λ6 378.81 found by Adams and Joy in the spectrum of RS Ophiuchi is suggested. The line λ6 528 is very near to SiI-forbidden line 6 526,88 predicted by Fowler. λ6 316 and λ6 449 also seem to be related to the predicted forbbiden KV-lines 6 316.6 and 6 446.5 respectively.

Determination of Longitude and Latitude of Some Stations in the Western Japan Sea District of Honshu

By Masahisa Torao

(Japanese.) [Tokyo Astr. Obs. Rep., 5 (1938), 219-227.]. This is the continuation of the series of astronomical position determination of the first class geodetic points within our area, that have been planned by the Geodetic Committee of Japan. In the summer of 1937 the author made an expedition to the mentioned district to carry out the observations with the Bamberg transit instrument of 70 mm aperture and a pair of chronometers. For the longitude work, the time determinations were made by the transit observations of stars with the nonpersonal registering micrometer and the comparisons of chronometers by registering the wireless time signals from the JJC station. The latitudes were determined by Talcott method with the star pairs selected from Boss P.G.C. After full investigations of errors of various sources the final results came out as given in the table, in which are appended the results of geodetic determinations together with the deviation of plumb-line.

Stations	L_a	L_σ	ψ_a	φ_σ	Deviations of Plumb Line ξ	η
(1)	8h56m59s.802	1s.048	35°31′24″.00	4″.87	+19″.13	−15″.21
(2)	8 51 55 .069	56 .007	35 30 37 .67	22 .70	−14 .97	−11 .46
(3)	8 48 56 .289	57 .594	34 59 8 .16	51 .68	−16 .48	−16 .04

Engineering

Some Problems in Increasing the Extraction of Oil

By Tatsuo Otagawa and Shogoro Kimura

[Journal of Mining Institute of Japan, Vol. 52, 612 (1936), 203-222.]—This paper describes certain fundamental relations governing the rate of flow of oil from a reservoir from the point of view of production engineering, formulating certain guilding principles for their possible application to various methods of oil extraction in the field.

Oil sands in strata are subjected to compression due to folding of the formation, and also by gas, and by both hydrostatic and rock pressures. By studying the effects of pressure on the porosity and coefficient of permeability of sand in a 5,000 atm. pressure apparatus, it is concluded that the reduction in porosity resulted in more compact arrangement of grains and the collapse of particles, which cannot materially hinder the accumulation of oil. However, this condition increases extraordinary the resistance to flow, thus rapidly diminishing the productivity of wells.

The efficient withdrawal of oil from a reservoir involves many engineering factors, such as:

(1) Increasing the head causes the

Digitized by Google

flow through sand (utilization and maintenance of reservoir energy, repressuring and water flooding).

(2) Diminishing the distance through which the oil flows (spacing of well, and underground mining).

(3) Increasing the coefficient of permeability (cleaning and shooting the well, and diminishing the viscosity, specific gravity, and surface tension of the oil).

The author emphasise that the technique for oil production is well established through investigating the law of oil drainage through sand, and express the belief that there must be a substantial reward for increased efficiency, with a recognition of the importance of sand studies and permeability determinations in the field.

Authors

On a Method of Producing Good Protective Films on Mg Alloys

By Seiji Goto and Hirosi Asada

(Japanese) [Tetsu-to-Hagane, 22 (1936), 798-800, with figs. and photos.]—Cd-Zn-Mg alloys, containing a large amount of manganese, are fairly resistable, such as AZG or AZF, to a 3% salt solution. If however, these alloys are heated to about 200°C in air after machining, their surfaces are convered with a certain film which is much more resistable as described below.

The average loss in weight from a sample containing Cd 4%, Zn 3%, Mn 1.8% and Mg 91.2%, heated to about 200°C, is 0.9% of its initial weight of 35 gm (test piece for tension test), when immersed in a 3% solution of common salt for 28 days. Its strength also declined from 23 kg/mm² to 19 kg/mm². The corrosion that occurred in two or three pits were caused by defects in the film, i.e. pitting corrosion.

In the case of the unheated sample, in which the loss in weight was 1.3% and the reduction in strength 7 kg/mm², there was a general corrosion around the surface.

For studying the effects of Cd and Zn on this resistable film, Cd-Mn-Mg and Zn-Mn-Mg alloys in various proportions were prepared. Each of them were heated to 150, 200, 250, and 300°C and comparisons made of their corrodibility, qualitatively, with the unheated specimens after immersion in a 3% salt solution.

From the results they conclude that with Zn up to 2%, no harm is done to the surface film, while Cd up to 6% aids in the formation of film, and the more manganese it contains, the more anticorrosive becomes the film. About 200°C is the best temperature for heating to produce this film.

Irreversibility of Gas Absorption in Various Kinds of Iron

By Keizo Iwase, Masaji Fukushima and Saburo Mitsui

(Japanese.) [Tetsu-to-Hagane, 22 (1936), 770-773, with figs.]—Gas absorption experiments were carried out with various kinds of iron and its alloys in order to study the effect of impurities and heat treatment. The experiments showed that virgin iron, when it contains no other metallic element, behaves toward gas reversibly, while impure iron behaves irreversibly. That is, pure iron absorbs the same quantity of gas whether it is once heated in the gas or not, while impure iron absorbs the gas in less amount when it is once heated in the gas as compared with virgin iron.

On a New Method of Calculating Secondary Stresses in the Frame of a Bridge Truss, and Some Characteristics of Such Trusses

By Hukuhei Takabeya and Tadaaki Sakai

(Japanese). [Jour. Civ. Eng. Soc., Japan Vol. 23, No. 3 (March, 1937), p. 251-267, with figs.]

The Distribution of Stresses around a Circular Tunnel with Lining

By Bennosuke Tanimoto

(Japanese). [Jour. Civ. Eng. Soc., Japan, Vol. 23, No. 4, (April, 1937), p. 357-379, with figs.]—As an example of the problem of gravity stress, the author succeeded in solving the distribution of stress around a horizontal circular tunnel in a gravitating elastic solid having a lining of uniform thickness, using Airy's stress-function. Supposing that the displacement is a plane strain, the forms of the stress and that of the displacement, which are obtained by adequate integration of the stress in polar coordinates, are sufficient for the boundary conditions, one of which is at the inner and outer circular boundaries, and the other at infinity. For convenience of calculation, assuming that the surcharge is sufficiently large, the effect of the top surface is neglected. In numerical examples, assuming that the surroundings consist of earth and the lining of concrete, the max. hoop-stress

Digitized by Google

in concrete is about 50 kg/sq. cm.; in which the surcharge is 15 m, the inner radius of the tunnel 5 m, and the thickness of the lining 40 cm.

Author

On the Properties of Manchoukuo Tars, Heavy Oil, Middle Oil and Cut-Back Tars Prepared with Heavy Oil and Residual Tars as Road Making Materials

By Eizo Nishikawa and Yosio Yamashita

(Japanese). [Report of the Research Office of Public Works, Dept. of the Home Affairs, Japan, No. 39, (Nov., 1937), p. 131-163.]—The chemical and physical properties of Manchoukuo tars, heavy oil, and middle oil were tested as road making material, and it was found that heavy oil was best suited for cut-back oil. Twenty-eight samples of cut-back tars were prepared with heavy oil and residual tars that were made from raw tar by distillation up to various temperatures, such as 235°, 250°, 270°, 300°C. All the cut-back tars were again tested for its properties as road making material. The distillation temperatures and the proportions of the oil and residual tars for making suitable road tars, and complying with the specifications for hot-application tars of grades D, E, F, and G, were determined. The specifications will be found in Office Report No. 25. The results are summarized in a diagram showing the relation of the distillation temperature and heavy oil percentage to the grade of the road tar.

Authors

The Effect of Knots on the Compressive Strength of Wood

By Toru Mori

(Japanese). [T. I. J. A. No. 5, 1937.] — The mechanical properties of knotty wood used in building constructions, bridges, etc. have not been studied to the same extent as those of clear wood, although the former is more important than the latter. For this reason, the author has made some experimental researches on kotty wood, of which this paper is the first report. It deals with the effect of knots on the compressive strength parallel to the grain.

(1) The kind of knot, whether sound knot, loose knot, etc. has a far-reaching effect, but sound knots which checks in them are similar to those without checks.

(2) The difference owing to the particular species of the wood (two species were tested) is not clear.

(3) The strength of a short column having a knot on its centre line can be obtained by the following formula, if provided the strength of the clear wood is known:

$$y=1-(1-y_1)/x,$$

where y is the ratio of knotty-wood-strength to clear-wood-strength,
x is the ratio of column-breadth to knot-breadth,
y^1 is a constant depending upon the knot-quality.

The values of y^1 are as follows:

Author

Kind of knot	y_1
Sound	0.6~0.5
Semi-sound	0.5~0.2
Loose	0.2~0.1
Decayed	0.1~ 0
Holes	0

A Study of Wood Rot by Artificial Culture of the Fungus

By Saburo Soshiroda

(Japanese). [T. I. J. A., No. 4, 1937.] — With a view to obtaining reliable data on wood-rot affecting Japanese timber most used in building construction, the hyphae of Poria vaporaria Pers, which is regarded as doing the worst damage to wood, was cultivated artificially, and a variety of pasteurized wood test-pieces was inoculated with the mycelium. The test pieces were gently placed in test tubes, at constant temperature, and left in the tubes for 3 or 6 months, after which they were removed, and the altered weight and strength due to the rot carefully compared, as follows:

(1) Comparison of the percentage of loss in weight and strength due to the effect of rot on the heart and sap wood.

(2) The percentage of loss in weight of the test pieces owing to rot for every month during the 6 months.

(3) Comparison of percentage of loss in weight and strength due to the effect of rot of the wood of various water content.

(4) Comparison of percentage of loss in weight and strength due to the rot in wood from various localities.

Author

On the Contraction of Concrete (continued)

By Kazuo Ono

(Japanese). [T. I. J. A., No. 5, 1937.] —Part 1. Observations on Concrete Structures. (2)

In a reinforced concrete structure in

Digitized by Google

Tokyo, cracks in the concrete floor, caused by shrinkage of the concrete were observed. The concrete of the affected part consisted of Velocement (rapid high strengthening portland cement) and Asano portland cement: the former used in the wet consistency and the latter in both dry and wet consistency. The concrete was from 7 to 14 months old. It was found that the concrete of wet consistency had contracted into a stronger mass than that of dry consistency. The effects of the two cements on concrete shrinkage were not clearly distinguishable.

Part 2. Researches in the Laboratory. (2)

In the laboratory, measurements were made of the shrinkage of the Tamagawa-sand-cement-mortars, made from 4 cements (2 portland-cements and 2 rapid high strengthening portland-cements) by means of a water-cement ratio of 0.65 and a mixture of cement 1 and Tamagawa sand 3.3, (which gives to each mortar about the same consistency, that is, a flow of 200%). The size of the test specimens was $4\times4\times20$ cm and there were 4 curing conditions in water namely 0 days, 1, 3, and 7 days.

The results of the tests were as follows:

(1) The characteristics of the time-shrinkage curves of the four cement-mortar specimen were about the same.

(2) It did not at all follow that, because a rapid high strengthening cement was used, the mortar was necessarily quick shrinking.

(3) Shrinkage of mortar is retarded by water curing, but if the time of curing is less than 7 days, the mortar, when brought into contact with the air, contracts with almost the same shrinkage as that of the test piece that has not been cured in water.

Author

The Influence of Ground Elasticity on the Vibration of Buildings

By Ryo Tanabashi

(Japanese). [T. I. J. A., No. 5, 1937.] —The mode and period of the horizontal vibration of buildings depend not only on the flexibility of the building frame but also on the elasticity of the ground on which the building stands.

The author solved the problem mathematically on the assumption that the building frames are rectangular, uniformly rigid, and further that, besides the deformation of the frame, the building as a whole is liable to incline with respect to the ground.

Although the period of the first mode of free vibration is considerably prolonged by the elasticity of the ground, those of higher modes are only slightly affected by ground elasticity. An elastic ground adds to the safety of the frame from earthquake shocks, especially when the period of the first free vibration of the building is longer than the predominating vibration period of the ground, thus adding to the aseismic property of the building.

Author

Distribution of Horizontal Forces to each Frame of a Building

By Ryo Tanabashi and Masanobu Itomi

(Japanese). [T. I. J. A., No. 6, 1937.] —The theoretical distribution of horizontal forces caused by wind pressure or earthquake shock to each frame of a building becomes a very complex problem when some of the frames are rigidly joined rectangular frames and the others are braced portals. The author solved the case rigidly, and also the case when the bed of the building is elastic and rigid girders connect the footing of each frame.

The result shows that the distributing factors cannot be determined without such analyses, and that the factors vary widely with the elasticity of the ground and the rigidity of the girders connecting the footings.

The Effect of Ground on the Aerodynamic Characteristics of a Wing

By Ichiro Tani

(Japanese). [J. Soc. Aero. Sci. Nippon, Vol. 3, No. 26 (1937), p. 659-674, with figs. and tables.] — This paper deals with the effect of ground on the aerodynamic characteristics of a monoplane wing. In the first part of the paper theoretical calculation are worked out, taking into account the finite dimensions of the chord and the thickness of the wing. The results of calculations are then reduced to a simple form, readily available for use. The second part of the paper gives the results of wing model experiments that were carried out in the 2 m wind tunnel of the Aeronautical Research Institute, Tokyo Imperial University. For moderate values of the lift coefficient, the calculated effects of ground agree very well with the experiments.

The changes in the drag coefficient c_x, the coefficient of pitching moment about the leading edge c_m, and the angle of attack α due to the ground effect at a

Digitized by Google

certain value of lift coefficient c_z may be summarised as follows: c_x is reduced for all values of c_z, c_m is reduced and α is increased for small values of c_z, and c_n is increased and α is reduced for moderately large values of c_z. The maximum lift is somewhat reduced when the distance of the wing above the ground is of moderate value, while it is increased when the distance becomes extraordinary small.

Author.

On the Flow Around the Propeller

By Sanji Kawada

(Japanese). [J. Soc. Aero. Sci. Nippon, Vol. 4, No. 27 (1937), p. 767-773, with figs.]—The potential problem relating to the flow induced by a finite number of helical vortices is investigated, and a stream function anologous to two dimensional or three dimensional flow with axial symmetry is shown.

Theoretical stream lines were drawn from this stream function and compared with the stream lines obtained experimentally by various methods.

Author

On a Simplified Method of Calculating Propeller Performances and Some of the Results Obtained

By Matao Sanuki

(Japanese). [J. Soc. Aero. Sci. Nippon, Vol. 4, No. 28 (1937), p. 851-864, with figs. and tables.] — Several simplifications of the method proposed by Prof. Moriya are shown, the induction factors being given in Table 2-4 for ready use, some of the difficulties likely to be encountered in evaluating the graphical integration are solved.

As examples, calculations are shown for propellers of pitch-diameter ratios 1 and 1.5, propellers of uniform circulation, propellers in a non-uniform stream, and for propellers of various degrees of strength.

Author

A Special Aging Phenomenon in Alloy Steel

By Keiichi Ota

(Japanese). [Tetsu-to-Hagane, Vol. 23, No. 4 (1937), p. 354-359, with Figs., Photos and Tables.] — The elongation and reduction in area of a tensile specimen freshly taken from a large alloy steel forging was found to increase strikingly as observed from a specimen that was tested after a few days, without any change in the tensile strength, but with marked change in the fracture.

This aging phenomenon appeared more distinctly in the tension test than in the impact test. By heating the specimen, even at 100°C., a marked effect was caused. With increase in cross-section of the specimen, it was found necessary to heat it for a longer time, proportional to the cross-sectional area, in order to eliminate perfectly the aging phenomenon. The elongation and reduction of area in the steel in the cast condition rise and almost attain the values for the forged condition, provided that the time and temperature of heating are sufficient. This aging phenomenon appeared conspicuously in the form of flakes in the steel forging. Both before and after aging of the specimen, there was considerable difference in the hydrogen content. By heating the aged specimen in hydrogen gas for 1 hour at 500°C., the mechanical properties, the hydrogen content, and the appearance of the fracture in the specimen were restored to their original states.

Fundamental Studies of Si-Mn Steel as Spring Steels

By Yoshimasa Kojima

(Japanese). [Tetsu-to-Hagane, Vol. 23, No. 4 (1937), p. 774-786, with Figs., Photos and Tables.]—Si-Mn steel, containing 0.5% C, 2% Si, and 1% Mn were selected as standard, and the effects of the elements Cr, Ni, Mo, V, Co, and W upon the properties of this steel were examined.

CHAPTER XXXIV

PRESS AND PUBLICATIONS

Press

Early History

Yomiuri Even in Old Japan some form of public announcement was issued from time to time, like the Acta Diurna of the era of the Roman Empire, but perhaps the present subject may appropriately be begun with the Yomiuri, the oldest semblance of the newspaper, which name can be literally translated "reading aloud and selling." The Yomiuri sheets were so named because the venders read aloud the contents of the newspaper on the street while soliciting buyers. The Yomiuri sheets were essentially the Flugblatt of the Middle Ages of Europe. They consisted of single printed sheets, or pamphlets of several pages, recording the latest events of the period. Even in those days the progress of wood-block prints permitted the appearance of illustrations in the sheets. In many cases the illustrations were the outstanding feature, and the descriptive matter was of secondary importance. In this respect the Yomiuri differed from the Flugblatt of Europe.

Its Publishers Old records are lacking to identify the publishers of the Yomiuri, but it appears that the publishers of newspapers, or rather equivalents to newspapers, in the earlier part of the Tokugawa period (about 250 years before the Restoration of Meiji, 1868) were men of little fame and honour. Even at the end of the Tokugawa period it appears that the publishers of the Yomiuri were men of so lowly positions that they were not permitted to enter the society of even woodblock printers. It is, however, considered likely that this early form of newspaper failed to make any progress owing to government pressure. The Yomiuri carried contents that were often inflammatory and distasteful to the government. Suspension of publication was ordered so frequently that no decent publishers dared to take it up as an enterprise. Only men of low repute engaged in the business often against the law.

Printing of the Yomiuri sheets was done by wood-block prints. The contents of the Yomiuri sheets can generally be divided into two, prose and poetry. This distinction, it appears, existed from the early part of the Tokugawa period. In the era of Genroku (1688–1704) the hawkers sold their sheets on the street either calling the attention of prospective buyers by singing, with or without the accompaniment of the samisen, or merely reading aloud the contents. At the end of the Tokugawa period sheets were sold with the sellers singing popular ballads.

Its Contents A perusal of those Yomiuri sheets still extant shows that at the outset of the development the chief interest of the sheets lay in the illustrations. What are believed to be the oldest Yomiuri have illustrations of the Battle of the Osaka Natsu-no-jin in May in the first year of the era of Genna (1615), accompanied by descriptive matter. Judging from the frequent issuance of suppression or suspension orders, Yomiuri sheets appear to have been published and sold in abundance during the eras of Empo (1673–81), Jokyo (1684–88) and Genroku (1688–1704). In Western Japan, with Osaka as the centre, there is evidence of the popularity of erotic contents in Yomiuri sheets, featuring such stuff as stories of double suicides. Since the vendetta of the famous Forty-seven Ronin, vendetta stories formed the chief subject of interest and after the era of Genroku, subjects of natural calamities were featured. In the eras of Bunka (1804–18) and Bunsei (1818–30) the enforcement of justice and morality undertaken by the Shogunate government, stressing the protection of right and chastisement of wrong, was reflected in the stories featured in the Yomiuri sheets of those days, even in the accounts of natural calamities and those of sex relations. Because the stories were written by men of low repute, the contents of the Yomiuri sheets in many cases were repellent in tone. Immediately before and after the Restoration of Meiji, accounts of the civil disturbances were written, but by this time the number of Yomiuri sheets had considerably decreased owing to the appearance of

Digitized by Google

newspapers in the more correct sense of the term.

Fusétsugaki Another equivalent of the modern newspaper, in addition to the Yomiuri, was a periodical named "Fusétsugaki" or Book of Reports, which carried foreign intelligence. These books were of two kinds, one with Dutch and one with Chinese reports. After the third Tokugawa Shogun adopted the policy of seclusion, it was only China and the Netherlands which had intercourse with Japan. Captain "Yanyos" (Jan Josten) of Holland, after Japan's adoption of the seclusion policy, presented annually a book descriptive of foreign affairs to the Shogunate government. It was the Oranda Fusétsugaki, or Book of Dutch Reports. The Chinese government in those days presented to the Shogunate government of Japan Chinese intelligence after the manner of the Dutchmen. Information obtained thus was placed in the hands of the Prime Minister and kept confidential, but after the American "black ships" came to knock at the door of Japan, permission was granted to make copies of those books for public circulation. The presentation of Dutch documents continued until the era of Ansei (1854–60), but as the country was opened to foreign intercourse this custom was discontinued at the request of the Dutch government, which instead of the customary annual volume presented Dutch newspapers to the Japanese government. It is considered certain that the newspapers thus presented to Japan were copies of the Javasche Courant, organ of the Government of Batavia.

Precursor of Modern Paper When the provincial clans requested that the Dutch Book of Reports be made public, the Shogunate government's Yosho Shirabésho, or Bureau for the Study of Western Learning, agreed and planned to publish it. This plan did not materialize, as the Dutch government then replaced the book with newspapers, but instead, the bureau translated the newspapers into Japanese and published them for general circulation. This was the precursor of the modern newspaper in Japan. Not content with this Dutch newspaper, the Shogunate government continued to translate and publish other newspapers from Holland and imported Chinese-language newspapers published by white Christian evangelists in Hong Kong, Shanghai and other places, and had them not only translated and annotated but printed and bound into books and entrusted Hyoshiro Yorodzuya, a book purveyor to the Shogunate government, with the public sale of these books. In general printing wooden types were used. For printing these Chinese newspapers imposition was adopted and for this purpose the Shogunate government had to establish a special department for type foundry. This enterprise was a reflection of the out-and-out principle the Shogunate government adopted for opening the country to foreign intercourse. Those books were chiefly published during the era of Bunkyu (1861–64). Hence they were popularly called Bunkyu Shimbun (newspaper).

Papers in Yokohama In the meantime, anti-foreign sentiment was gaining force in this country and after the era of Bunkyu this interfered with the translation and publication of foreign newspapers. Foreign residents of Yokohama, however, translated foreign-language newspapers and published then in Japanese and they were patronized by those who favoured opening the country to foreign intercourse. Men on the staff of the Bureau for the Study of Foreign Learning had an eye on foreign affairs and established a new institution for the purpose of translating into Japanese articles dealing with Japan which appeared in the English-language newspapers in Yokohama, such as the Japan Commercial News and Japan Times. Those translations were not printed but written by scribes and circulated among interested persons. The years during which this was done extended from 1863 to 1865. Foreign residents of Yokohama also published three Japanese-language newspapers, Kaigai Shimbun (Foreign Newspaper), Bankoku Shimbun (International Newspaper) and Rondon Shimbun (London Newspaper). Of these three, the Bankoku Shimbun had in its contents not only foreign intelligence but news of Yokohama and comment on the English-language newspapers of Yokohama; it introduced ideas of British civilization and carried many advertisements. This journal was edited ably in a characteristic style and published monthly. From this time general progress in newspaper-making was noticeable.

Foreign Language Papers The first foreign-language newspaper published in Japan was the Nagasaki Shipping List and Advertiser issued for the first time in the year 1861 by a resident Britisher, Mr. Hanseard. It was a weekly. The publisher soon moved to Yokohama, where he continued his publication under the name of The Japan Herald, the first issue of which was brought out in December of the same year. He

Digitized by Google

employed Mr. Black, another Britisher, then a resident of the port city, as editor-in-chief. The example set by the Japan Herald was soon followed by the appearance of the Japan Commercial News in 1863, a weekly published by a Portuguese. In October of the same year, the Japan Herald, in addition to the weekly, started a daily newspaper which featured advertisements. In the year 1865 the Commercial News was discontinued and Mr. Rickerby, a banker, bought the newspaper equipment and started the Japan Times in September of the year. In 1867 Mr. Black had a dispute with the new owner of the Japan Herald, and, leaving the paper, he issued the Japan Gazette, an evening paper. The popularity of the Japan Gazette overwhelmed the Japan Times and the latter lost much patronage and finally had to discontinue publication. The disappearance of the Japan Times, however, was followed by the launching of the Japan Mail. In addition to these newspapers, there was another English-language newspaper, having the name of the Japan Express, published by an American, whose first issue appeared in 1866. The copies of this newspaper were hand-written, carved in wood blocks, and printed. While the name of the publisher and the period of publication are unknown, it is recorded in a diplomatic document in the possession of the French government that this journal represented the American interests. In addition to these papers, there were also a French newspaper, L'Echo du Japon, in the era of Kéio (1865–68), an English magazine of caricature, the Japan Punch, which was published continuously for 20 years from the era of Bunkyu (1861–64), and a French magazine of caricature entitled Tobayé. These publications stimulated directly or indirectly the birth of the Japanese modern newspapers.

The Restoration Demand for foreign intelligence was the principal factor in the birth of newspapers in the East as in the West. In Japan, too, newspapers of the earlier periods carried much foreign news, but when there were big developments like civil disturbances they played up internal affairs. The Restoration of Meiji in 1868 afforded the press of Japan much scope for development. Newspaper editors in Yédo, the present Tokyo, were excellent scholars and their papers were much superior to those edited in the provinces. One of the papers in Yédo already advocated parliamentary politics as early as this period. Newspapers published by those holding the "Emperor-centric" policy were filled with articles which merely reflected on the intelligence of the editors themselves. They only advocated the "Emperor-centric" policy and did not propose any advanced ideas about reforms. Newspapers affiliated with the Shogunate government enjoyed much larger circulation than their competitors and it is stated that one of them had a circulation of 3,000.

The Press Law

The press law in Japan was enforced by the Government for the first time in February, 1869. This was the signal for several new newspapers to spring up. The Government, however, interfered so much with the press that sales of newspapers were much hindered and the healthy progress of the press was checked. While the business side of the press was dull, editing itself attained notable progress. Political news had become unusually constructive and efforts were made to establish a new civilization and propagate new and advanced ideas among the people.

Modern Papers

The Yokohama Mainichi The first true Japanese daily newspaper appeared in December, 1870, with the publication of the Yokohama Mainichi Shimbun. Not only was this newspaper a daily but it consisted of a single foreign-style paper sheet with printing done with lead types. In outside appearance it had the semblance of the modern newspaper. Although its contents were much inferior to those of the newspapers that were founded later in Tokyo, it resembled English-language newspapers in that it carried many advertisements.

More Papers Born The year 1872 saw several more dailies born, newspapers which were more perfect in appearance and reading matter than their predecessors. Those newspapers included the Tokyo Nichi Nichi Shimbun, Yubin Hochi Shimbun, and the Nisshin Shinjishi, the last being edited under the supervision of Mr. Black, formerly editor of the Japan Herald. The Nichi Nichi and Hochi remain to this day but the Shinjishi had to change hands in 1875 when the Government, in an effort to bring pressure to bear upon democratic newspapers, controlled the activities of foreigners in newspapers. The change of ownership brought decadance to the journal and the paper was discontinued shortly afterwards.

Government and Press

Era of Terrorism An era of terrorism dawned upon Japan's journalism in 1875 when the government, dissatisfied with the way in which the press in general stirred up the discontented elements of the people, revised the press law with the avowed purpose of curbing the influence of the newspapers. Severe punishment was provided for violation of the press law. Journalists writing articles censuring the government were fined or imprisoned. Indeed, this was the first time journalists in Japan were exposed to punishment. Not content with this cruel legislation, the government in July, 1877, invested the Home Minister with power to suppress newspapers or delay their publication, and he was thus free to bring pressure to bear upon them as he saw fit. This objectionable law worked havoc with the press, whose progress was much hampered thereby.

The era in which newspapers served as political party organs began in 1881. Two years before that time the movement in favour of instituting the Diet was launched by the late Taisuké Itagaki and others.

Revised Press Law The government's desperate policy of oppression toward the liberals of the period, which resulted in the prohibition of the formation of political associations and the oppression of newspapers and magazines, came to a definite halt on December 26, 1887, with the enforcement of a new government decree. Two days later a revised press law was issued, considerably modifying the strict control of the press, which had had the effect of almost exterminating all the free political organs of the country. The new press law was drafted on the basis of the principle of "freedom of the press," recognized in the Japanese Constitution which was to be promulgated shortly. The new press law was received by journalistic circles with much satisfaction. Indeed, the modified press law marks a turning point in the history of the development of the modern newspaper in this country.

Whereas under the old law a prospective publisher had to apply for a permit to start a newspaper, by the new regulations he had only to notify the authorities of his intention to issue a journal. The prefectural governor was robbed of his power to suppress newspapers or confiscate the newspaper plants and only the Home Minister was given such power. Unreserved criticism for public good was admitted, and compared with the despotic rule that had prevailed before, newspaper management under the new law became markedly free.

Emergence of Independent Dailies

The approaching promulgation of the Constitution, coupled with the removal of the ban on the formation of political associations and the growing political enthusiasm among the people, revived political newspapers. In the meantime, the Diet was instituted and the majority of the best-known editors of influential newspapers were elected to the legislature. As a natural consequence, the newspapers of these editors became their political tools and alienated public sympathy. Their popularity showed a decided tendency to wane.

The Kokumin and Yorozu While the political organs were thus losing influence, a strictly politically-independent newspaper which refused to cater for the popular taste of the people but which assumed an attitude to instruct the public was founded and caught the fancy of the intellectuals of the day. Its editing, however, was on the old lines and this newspaper never became popular. In the year 1890 Mr. Iichiro Tokutomi founded the Kokumin Shimbun, a popular newspaper. This journal enjoyed the support of the masses and soon other papers more or less imitated the style of editing inaugurated by the Kokumin. In 1892 the late Mr. Shuroku Kuroiwa founded the Yorozu Choho, which added to the Kokumin's style of editing a strong spice of sensationalism, devoting much of its space to the publication of detective and love stories. The Yorozu invaded the fields of the Miyako Shimbun, Yamato Shimbun and other newspapers then having the largest circulation. Thus, the promulgation of the Constitution served to bring about marked progress in the development of the modern newspaper in this country.

Chinese War and the Press The Sino-Japanese War (1894–5) caused severe competition in news reporting. The Osaka Asahi Shimbun, by introducing new features in covering war news, greatly increased the number of its subscribers. In Tokyo the Chuo Shimbun, closely affiliated with the military, was conspicuous for its activities in the issuance of extras and consequently gained an enlarged circulation. Other papers also sent war correspondents and featured news from the front. The Yorozu then was the most popular newspaper, having a circulation of 50,000. In point of circulation the newspapers of that time were in the follow-

Digitized by Google

ing order: The Yorozu Choho, Kokumin Shimbun, Tokyo Asahi Shimbun, Miyako Shimbun, Nihon Shimbun, Chuo Shimbun, Tokyo Nichi Nichi Shimbun, Jiji Shimpo, Mainichi Shimbun, Yubin Hochi Shimbun and Yamato Shimbun. The war was also responsible for the appearance of influential provincial newspapers, including the Fukuoka Nichi Nichi Shimbun in Kyushu, the Shin Aichi in Nagoya, the Kahoku Shimpo in Sendai and the Hokkai Times in Hokkaido.

After the Russian War

Catering to the Public Following the Sino-Japanese War the majority of the newspapers in Tokyo adopted an impartial attitude toward politics and concentrated their efforts in popularizing pages. To advance their sales they resorted to means which often savoured of vulgarism and received public criticism. The city of Osaka witnessed a duel between the Asahi and the Mainichi not only in business but in news gathering. In the meantime, the Russo-Japanese War (1904–5) occurred to start keen competition in war coverage. The Asahi both in Tokyo and Osaka, the Osaka Mainichi and the Jiji Shimpo competed severely in the matter of extras and increased their circulation. At the end of the war the peace treaty was signed at Portsmouth, but the peace terms were found unsatisfactory and stoutly opposed by all the newspapers of Tokyo and Osaka, with the exception of the Kokumin and the Chuo, both of Tokyo, the political organs of the then Government. Anti-peace mass meetings were held in Tokyo and Osaka, and in Tokyo the participants in the mass meeting, incited by inflammatory articles in one or two newspapers, turned into a mob and attacked the building of the Kokumin Shimbun. To suppress the mob the government had to proclaim martial law. The government simultaneously issued an urgent Imperial Ordinance and suspended the publication of the newspapers for certain periods which incited the public to violence. During one month shortly after the enforcement of the Imperial Ordinance the Yorozu, the Niroku, the Miyako, the Nihon, the Jimmin, the Asahi of Tokyo and Osaka, and other papers were suspended. Of these papers, the Niroku and the Osaka Asahi suffered suspension twice in a month.

Equilibrium of Influence The panic in the newspaper world thus brought about upset the equilibrium of influence. The Kokumin was robbed of much circulation; so was the Chuo. The Yorozu, with a special appeal to the youth of Japan, increased its circulation markedly. In Osaka the Mainichi took advantage of the suspension of publication which the Asahi suffered and invaded its unfortunate yet heretofore superior competitor's field, with the result that finally their influence in business and other respects became about even.

Motion Picture Utilized Several changes for the better were effected following the Russo-Japanese War, and it is noteworthy that the changes effected were all concerned with newspaper enterprises. The Kokumin, which had suffered a dwindling popularity since the paper became the object of public censure by supporting the government that signed a "humiliating peace treaty," issued provincial editions, an example which was soon followed by other newspapers. Shortly afterward the Hochi attained success by issuing an evening edition. This ambitious enterprise was also followed by several other competitors. As regards the contents of newspapers, the Yorodzu reported all sorts of sports and amusements; the Asahi bringhtened its pages with articles from the pen of famous men of letters like the late Soseki Natsumé, and the Hochi established a precedent by carrying a novel in serial form that suited home reading. On the business side, the Hochi took the initiative in establishing provincial branches. The Yamato promoted an exhibition and began a motion picture demonstration show throughout the country.

That these enterprises attained favourable results soon showed in the increased number of circulation. According to reports considered reliable, the Osaka Asahi topped the list with 350,000. The Osaka Mainichi came next with 300,000, and the other papers came in the following order: the Hochi, 200,000; the Yorodzu, the Kokumin and the Yamato each 150,000; the Tokyo Asahi, 80,000, and the others 30,000 or 40,000 each.

In the Taisho Era

Expansion of the Business One notable advance made by the press of Japan during the Taisho Era was the remarkable expansion of newspaper business. All first-class journals erected imposing structures for their offices and installed expensive high-speed presses. By the end of the era all the leading newspapers in Tokyo and Osaka had become public corporations wih their capitalizations above the ¥1,000,000 mark. The earthquake and fire of 1923 reduced

Digitized by Google

to ashes the majority of the newspapers in Tokyo, except the Hochi, Nichi Nichi and Miyako. Of the unfortunate sufferers, those financially well off got to a good start and soon recovered their former positions, but those less financially favoured failed to raise their heads again and had to be content with insignificant showings. At present the Osaka Asahi and Osaka Mainichi possess more than 1,000,000 subscribers each, and big papers in Tokyo have subscribers approaching the above figure. It is not an exaggeration to say that the achievements made by the press of Japan after the dawn of the era of Showa (1926–) are a high-water mark of Japan's modern culture.

Present-Day Newspapers

Of numerous papers, the Asahi and the Mainichi are the most widely circulated and the most popular with our intellectuals. Both of these papers have their main offices in Osaka. They also have a large office each in Tokyo, one being called the Tokyo Asahi and the other the Tokyo Nichi Nichi. Recently the Yomiuri has come to run a close second in the race for press leadership. Not only are these papers widely read in the larger cities, but they also vie with one another in outrivalling the minor local press in provincial cities and towns by issuing their own local editions which possess the features of the local press in addition to the features essentially their own.

The more influential dailies in Tokyo and Osaka pay special attention to international news, that is, to cables from abroad. They are eager to get foreign news as speedily as possible. Japan's largest news agency, the Domei Tsushin Sha, has been and is obtaining a great deal of news from abroad in concert with the world's influential news agencies. Not to be behind, the Asahi, the Mainichi, the Yomiuri and other large papers all have their own special correspondents stationed in the principal cities of the world. So complete is its network of communications that our press, coupled with the spread of radio and periodicals, has done much to augment knowledge of international affairs on the part of the nation at large.

The reason why the Asahi and the Mainichi have attained the present prosperity may be found in their critical attitude towards the successive powers that be, as well as in the speed and accuracy with which they furnish news to the readers. This has been particularly so with the Asahi, with the result that it has received strong support from the nation's intellectuals. Since the Manchurian incident, however, there has been much change in the attitude of editorial writers of our dailies. Just as the press in other countries has lately been compelled to alter its functions, so in recent years our influential dailies, the Asahi, the Mainichi, the Yomiuri, etc., have come to find it necessary to modify their tone owing to the great change that has taken place in the political situation. In the main, the tendency is now for the press to support the Government's policy. It must not be supposed that the Japanese press is controlled by law. Still, one can easily imagine that a considerable change has been made in the functions of the Japanese press, whose duty it is to guide public opinion aright, simply as a result of editorial appraisal of the limits within which freedom can be exercised safely and profitably.

Activities in 1937 Since the outbreak of the present hostilities between Japan and China, conditions, political, economic and what not, in this country have greatly changed. It is natural that the press should also be influenced by the change and be run in accordance with the spirit of the times. The birth of the Domei Tsushinsha, the organization of the Koho Kyokai in Manchoukuo, the organization of the Information Committee, the enforcement of the law controlling seditious literature, the organization of the Cabinet Information Bureau and the invocation of Article 27 of the Press Law (governing the control of information regarding military secrets) have not only circumscribed the freedom of the press in giving information, but evidently are manifestations of the Government's intentions to mobilize the press for the good of the country.

The times being such, the editorial policy of the newspapers have come, consciously or unconsciously, to cooperate with the Governmental policies and great efforts have been made to give fresh informations on the progress of warfare in China, sending many correspondents to the front where not a few of them sacrificed their lives. By the good use of cinema leading papers are satisfying people with shows of living pictures of battles.

Government's Journalistic Role The spirit of the times was carried forward a step further when with the development of the China situation the Government has successfully launched upon a journalistic career. The Shuho (Weekly), the Shashin Shuho (Photo-

Digitized by Google

graphic Weekly) and the Zaisei (Finances) are representative magazines published by the Government. The Shuho, a supplement of the Official Gazette, is edited and published by the Information Bureau of the Cabinet. It is sold at 5 sen a copy. Official weekly though it is, the Shuho is far from being ideally edited, but in circulation it is so successful that it is now estimated at 350,000. Its cheap price and authenticity evidently account for the success of the Shuho. The weekly's rationalized salesmanship has also done a great deal for building up its great circulation. The weekly is sold systematically and efficiently through the bookstores and news stands where the Official Gazette is on sale. A similar sales campaign is adopted for all other official magazines, which, therefore, are conducted on a paying basis. Shashin Shuho which is only three months old at the present writing (April, 1938) is claimed to boast of a circulation of 150,000 copies.

Number of Newspapers

The number of daily newspapers in Japan proper in December, 1937 was 1,208. In addition, there were on the same day 609 newspapers issued 4 times or more a month and 5,980 newspapers issued 3 times or less a month. All these 7,797 papers come under the category of "newspapers" and are so treated by the Government. The newspapers classified according to prefectures follow :

Prefecture	Daily Papers	Issued 4 times or more a Month	Others and Total
Tokyo	254	120	1,920
Kyoto	31	10	322
Osaka	95	62	745
Kanagawa	19	11	133
Hyogo	48	32	347
Nagasaki	10	8	75
Niigata	23	26	143
Saitama	7	3	52
Gumma	14	8	68
Chiba	14	5	71
Ibaraki	19	6	84

Note: Besides there are 5,471 papers and periodicals without guarantee money, of which 214 are daily papers.

Mainly in Tokyo and Osaka The majority of leading newspapers are published in Tokyo and Osaka. This is because Tokyo is the capital of the Empire and Osaka is the centre of social and economic life in West Japan. The combined number of daily newspapers in the two largest cities is 30 per cent of all and their combined circulation covers almost all parts of this country. Large daily papers have their own provincial editions of more than 20 kinds. The spheres of provincial editions are divided between the large papers of Tokyo and Osaka. Tokyo papers publish provincial editions for Eastern Japan, Hokkaido and Saghalien, while Osaka papers issue those for Western Japan, Shikoku, Kyushu, Korea and Formosa. These provincial editions eat into the business spheres of country papers. Recently, Tokyo and Osaka papers have been issuing Manchurian editions. Next to these cities in the number of their papers come Aichi (Nagoya), Hokkaido, Kyoto, Hyogo (Kobé), Fukuoka and Nagano prefectures, reflecting the extent of cultural development of those localities. Okinawa prefecture (Loochoos) issues only 16, the smallest number of all, and 19 are issued in Tokushima prefecture in Shikoku.

Circulation

Circulation Unpublished The circulation of daily newspapers in Japan ranges from about 4,000 to about 1,500,000. Japanese newspapers never make public their exact circulation. For this reason, it is impossible to get the exact figures of circulation of each or any. What is believed to be comparatively correct of the daily circulation of more than 1,100 newspapers is an estimate of about 19,000,000, and in 1937 the average monthly consumption of paper by all newspapers amounted to over 800,000,000 lbs. The number of households in Japan is over 17,500,000. Newspapers are far more widely read in cities than in provinces and they are read more in commercial and industrial districts than in agricultural districts. Tokyo has the largest number of daily newspapers, and the more powerful ones are a well-defined force in society. Among them are the Tokyo Asahi Shimbun, the Tokyo Nichi Nichi Shimbun, the Yomiuri Shimbun, the Hochi Shimbun, the Miyako Shimbun, the Kokumin Shimbun and the Chugai Shogyo Shimpo. The first-mentioned two papers are predominant, having an overwhelming influence in newspaper circles. As organizations for news reporting these two giant papers rank among the world's largest newspapers.

Osaka City has a relatively small number of daily papers, 86 in all, but, as regards circulation, the Osaka Asahi Shimbun, which is the head office of the Tokyo Asahi Shimbun, and the Osaka Mainichi Shimbun, which controls the Tokyo Nichi Nichi Shimbun, predominate all, and their circulation is said to be nearly the same. The two papers have practically the whole of Western Japan under their control, and their influence is felt stronger in Kyushu districts by the publication of the "Kyushu Asahi" and the "Western Mainichi" commenced in February, 1935.

Estimated Circulation Estimated circulation of leading dailies in Japan is as follows:

Tokyo	
Tokyo Asahi Shimbun	1,100,000
Tokyo Nichi Nichi Shimbun	1,000,000
Yomiuri Shimbun	1,000,000
Chugai Shogyo Shimpo	150,000
Kokumin Shimbun	150,000
Hochi Shimbun	300,000
Osaka	
Osaka Asahi Shimbun	1,300,000
Osaka Mainichi Shimbun	1,200,000
Leading Provincial Paper	
Shin-aichi, Nagoya	200,000
Fukuoka Nichi Nichi, Fukuoka	180,000
Hokkai Times, Sapporo	100,000
Kahoku Shimpo, Sendai	100,000

Subscriptions Subscription fees of Japanese daily papers in large cities range from ¥1.00 to ¥1.50. Airplanes are used for transportation between Osaka and Fukuoka, but in most cases it is done by trains and electric cars.

English-Language Papers English-language daily papers in Japan proper and colonies are as follows: The Japan Advertiser (American), The Japan Times (Japanese owned), both in Tokyo; the Osaka Mainichi English Edition (controlled by the Osaka Mainichi Shimbun); the Japan Chronicle (British), in Kobé;

Digitized by Google

the Seoul Press (Japanese), in Keijo; and the Manchuria Daily News (Japanese), Dairen.

News Agencies

The long contemplated merger of the Shimbun Rengo Tsushin Sha (later Doméi Tsushin Sha) and the Nippon Dempo Tsushin Sha has been finally realized on June 1, 1936, the new agency assuming the name of the Dōméi Tsushin Sha. The Dōméi Tsushin Sha consists of over 200 Japanese daily newspapers as members and its directorate is organized by representatives of larger dailies and the Broadcasting Corporation of Japan. It maintains close relations with the A. P., U. P., Stefani, Reuter, D. N. B., and Havas, which have their branch offices in Japan in the Dōméi Building. Branch offices are located in Washington, New York, San Francisco, Los Angeles, London, Berlin, Paris, Moscow, Bangkok, Manila, Batavia, Singapore, Shanghai, Nanking, Hong Kong, and other important cities in China. The Nippon Dempo remains as a purely advertizing service agent after the merger.

Newspaper Organizations

The Japan Newspaper Association (Nippon Shimbun Kyokai) This consists of daily newspapers, news agencies and advertising agencies under Japanese management; it was founded in 1913. His Imperial Highness Prince Naruhiko Higashikuni has been honorary president of this association since 1926. Count Kéigo Kiyoura, former Premier, is president and Mr. Hoshio Mitsunaga, president of Nippon Dempo, is director-in-chief. It has among its honorary members noted persons such as Mr. Iichiro Tokutomi, Mr. Yukio Ozaki, Mr. Séiichi Uéno, Dr. Yujiro Miyaké, Dr. Minoru Oka, Mr. Ukichi Oshima and Mr. Takéshi Azuma. The association membership includes almost all the Japanese daily newspapers. The Shunjukai is a social club of newspaper editors, magazine writers and correspondents. It was organized in 1908 and has among its members leading newspapermen and magazine writers of Tokyo. The Nijuichinichikai is composed of high editorial staff members of daily newspapers. It was established in 1926. Its members are editorial directors, managers, news editors and other men of important positions in the editorial service of influential papers. The Shimbunkisha Club (Newspapermen's Association) consists of newspapermen and news agency reporters mostly connected with the business of the Imperial Diet. The Federation of Newspapermen and News Agency Reporters was organized in 1931. It consists of 46 newspapermen and news agency reporters' clubs which are connected with various governmental institutions and economic and financial bodies. Leading newspaper and news agency reporters' clubs are as follows:

Naikaku Kisha Kai	Connected with the Cabinet
Kasumi Club	Foreign Office
Yamashita Club	Séiyukai
Sakurada Club	Minséito
Shinto Kisha Kai	Kokumindoméi
Rōdō Kisha Kai	Proletarian Parties
Kunai Kisha Kai	Imperial Household Department
Kokuchokai	Navy Ministry
Shinyu Club	Army Ministry
Naiséi Kenkyu Kai	Home Office
Hitotsubashi Club	Ministry of Education
Zaiséi Kenkyu Kai	Ministry of Finance
Kinyu Doshi Kai	Bank of Japan
Noséi Kisha Kai	Ministry of Agriculture and Forestry
Unémé Kai	Ministry of Commerce and Industry
Tokiwa Club	Ministry of Communications

Newspaper Courses in Universities The Meiji University and Jochi University, Tokyo, opened their newspaper courses in April, 1932. The Newspaper School (Shimbun Gakuin), founded by Mr. Shinjiro Yamané, of the Kokumin Shimbun, sent out its first graduates numbering 40 in December, 1932. The Tokyo Imperial University Journalism Course, established as a section of the Department of Literature was opened in April, 1932. Mr. Hidéo Ōno is in charge of the course. Lecturers include noted newspapermen and magazine proprietors having many years' journalistic experience. The Newspaper Course of the Jochi University was opened in April, 1932. Mr. Ōno is in charge of this course also.

Students' Newspapers At the end of 1932 there were 51 so-called students' newspapers in Japan. These papers are published by universities and schools once a week or once or twice a month. The Téikoku Daigaku Shimbun, issued by the Tokyo Imperial University, is one of the largest of its kind and is issued every Monday. It is an eight-page paper, which was founded in 1920. The Kyoto Imperial University also issues a newspaper of the kind. The Mita Shimbun is issued by the Kéio University and is one of the oldest and most influential of those published by private universities. It was founded in 1917.

Publications

A Historical Summary

The number of books published in Japan prior to 1881 is not accurately known. But judged from the records and catalogues of books now existing, they may be roughly taken as follows :

About 1,800 between the time of founding the country and one year before the time when the Shogunate Government was established at Kamakura.

About 5,000 since the establishment of the Shogunate Government at Kamakura until one year before the time when the Tokugawa Shogunate was established.

About 60,000 between the establishment of the Tokugawa Shogunate and the Meiji Restoration.

About 130,000 between the 1st and the 10th year of Meiji, 33,819 between the 10th and the 13th year of Meiji, and 679,368 between 1881 and 1924. Statistics for latest years follow :

1927	19,967
1928	19,880
1929	21,111
1930	22,476
1931	23,110
1932	22,104
1933	24,025
1934	26,331
1935	30,347
1936	31,994

Publications under the China Affair Since the outbreak of the China Affair, the number of various publications in Japan has tended to decrease. Books and pamphlets have fallen off by a little over six per cent; the number of newspapers and magazines has declined slightly. It is noteworthy, however, that newspapers and magazines which had constantly been increasing in number stopped their advance and that the rate of increase in the number of new magazines published under the Publication Law has dropped conspicuously. This trend must be regarded as due not so much to the China Affair directly as to the high price of paper, which began to rise in the spring of 1937, and to the recent increases in postal charges.

According to statistics compiled by the Home Office upon the basis of publications submitted for censorship, there were published during 1937 no less than 31,064 books and pamphlets (including 332 Government documents), and 30,056 newspapers and magazines (including 1,422 dailies and 18,651 monthlies). These figures are about the same as those for the prior year, showing that the first six months of the conflict in China had no appreciable effect upon the output of the publishing business. Although the total volume has remained about the same, there have been notable changes in the type of literature. Most significant has been the decrease in the number of pamphlets and the increase in books. For a

Digitized by Google

time there was actually a deluge of pamphlets, the peak coming in July, 1936, when for the 996 books published there appeared 1,520 pamphlets. But the pamphleteer's popularity has dwindled in recent months, and in October, 1938, there were only 505 such literary efforts as compared with 1,898 books, a decrease of about two-thirds.

Many factors have contributed to this decrease in pamphlets, especially the ten-sen brochures. One factor has been the appearance of the Cabinet Information Bureau's Weekly Report, which has acted as an authoritative substitute for the various brands of news-interpretation pamphlets which held the field in the past. Another important cause has been the liquidation of various problems which had supplied the themes for many a pamphleteer owing to the unification of public opinion during the emergency. But the main reason for this significant decline is the fact that serious-minded readers no longer rely upon such pamphlets as a background for the daily news.

Of the thirty thousand publications turned off the press since the China incident, the largest individual group is represented by textbooks, numbering 3,628. Next comes literature with 3,162 works, followed by 2,229 books on educational subjects, 2,146 devoted to economics, 1,955 to languages, 1,949 to industry, 1,571 to religion, 1,483 to politics, 1,342 to engineering, and 1,237 to military subjects.

Similar trends are also noticeable in magazines. Magazine articles are tending more and more to deal with post-war measures and future national policies instead of being concerned largely with explanatory accounts of current developments. Among the different kinds of magazines, those specializing in economics, religion, education, history, electrical engineering, industries, military affairs, aviation, Japanese and Chinese calligraphy and local affairs have increased since July, 1937.

The fact that such a large number of industrial, engineering, and military works has appeared is a literary phenomenon which can be explained by the productive expansion policy of the Government, a most vivid testimony to the influence of the times. As hostilities continue, this surge of nationalistic ideas is tending to pervade not only the fields of politics and economics but also the cultural fields such as history, religion, philosophy and the arts. There was much talk in 1937 as to what things are and what are not "Japanese." The establishment of a new Japanese culture is the discussion of the hour.

Along the same lines, we have been witnessing a renewed publication of studies in Japanese history, biographies of pioneer patriots and provincial histories, particularly since the outbreak of the China Affair. These attempts are calculated to contribute toward the inauguration of a new Japanese culture through fresh studies of the traditions of Japan.

The increase in publications devoted to eingineering and industry is certain to stimulate scientific progress in this country and to result in the general diffusion of scientific knowledge among Japanese, although the present trend may primarily be a phenomenon attendant on the need of augmenting production to meet the requirements of war. Here, also, may be a part of the new Japanese culture.

The figures on publications for 1937 are as follows:

Imperial Household	45
Religion	502
Philosophy	219
Culture	69
Education	380
Science	10
Young people	5
For children	20
Literature, (foreign languages)	566
Novels	509
National language	20
Dictionaries	115
Foreign languages	127
History, biographies	516
Geography, maps etc.	193
Law	413
Politics, economy and Social science	1,304
Mathematics	34
Engineering	157
Medicine and sanitation	240
Commerce	101
Industry	381
Communication and Transportation	44

ing, when they enrich the pages of Japanese periodicals, and are always warmly received by Japan's intellectuals.

Yet another feature of these reviews is the large space devoted to short stories and dramas by coming writers. Each issue contains as a rule three or four such pieces of work, and in the case of a special number anything from five to seven. Short-story writing has been and still is occupying an important place in the literary field in this country. One of the cogent reasons for the healthy growth of this branch of literature in this country may be sought in the great favour shown by magazine editors to young writers able but unknown to fame. It has been the custom ever since the Meiji era for almost all literary efforts by writers, who have since found niches in the temple of fame, to be introduced to the public first through the pages of magazines of a serious type.

As these serious magazines are intended for readers of the highest level of intellect, they naturally have a limited circulation of from 30,000 to 70,000 each. Magazines which have a larger circle of readers are those catering to the tastes of the masses, young and old, and those edited primarily for the fair sex.

Most of our popular magazines intended for amusement are published by the Dai Nippon Yubenkai Kodan Sha, the president of which is Mr. Séiji Noma, known both at home and abroad as a magazine king. This publisher owns nine magazines, all enjoyed with avidity by the millions. Of these the more popular are the King, the Kodan Club, and the Fuji, the first-named being literally the king of Japan's popular magazines. These journals are said to have a circulation of from 300,000 to 400,000. Then there are two or three other magazines, such as the Hinodé and the Hanashi, which, though they are not published by Mr. Noma, boast nearly as many readers. These popular magazines have from 500 to 600 pages each. As might be expected, editors of such magazines are out to put in stories calculated to move the reader to tears or tickle his or her sense of humour. Here is a vast scope for popular writers of tales replete with those deeds of derring-do which reflet the ethos of the feudal days. Sentimental love stories by popular novelists are hailed with great delight. The Edgar Wallaces and Wodehouses of Japan find in these journals a great demand for their thrilling and side-splitting stories.

Keeping pace with these journals in point of popularity are women's magazines. The more popular of these are the Fujin Koron, the Fujin Club, and the Shufu-no-Tomo. They contain, among other things, articles on social problems previously touched upon in newspapers, such as the love affairs concerning film stars, cases of double suicide, scandals of noted ladies and many other sensational topics. Space is not allotted to sensationalism alone. A great deal of space is also devoted to articles on conventional things, such as hints on cookery, sewing and the care of babies—rehashed and repeated year in and year out—as well as romances by popular writers.

Another remarkable thing about all these popular journals is that whenever special numbers are issued, generally three times a year, two or three extra volumes, running up to 200 pages each, are thrown in as a token of gratitude to the reader. This idea of showing generosity was originally hit on by Mr. Noma. The extra volumes thus given into the bargain generally contain articles on the ABC of manual art, or else articles meant purely for amusement. All this goes to show, if nothing else, that publishers of such journals are great consumers of paper.

Of the monthly magazines described above, those of a serious nature generally see the issues of the following month out on or about the 19th of each month, popular magazines much earlier, that is, at the beginning of each month. As soon as they are out a half-page advertisement, showing the contents with subjects and names of writers of feature articles printed in large type, is inserted in turn for two or three days on end in the principal newspapers. There can be no doubt that this sort of advertisement serves as a powerful magnet.

As already stated, there are at present more than 8,500 varieties of monthly journals in Japan. Of these about 800 are on sale in Tokyo. Below are given figures representing some of the principal magazines :

Magazines of a serious nature	250
Magazines for amusements	58
Women's magazines	25
Young men's magazines	95
Juvenile magazines	30

There are practically no weekly periodicals of any importance in Japan. The Asahi, one of the most im-

Digitized by Google

portant daily newspapers in this country, once started publishing a weekly of a serious nature, giving news of the previous week lumped together and comments made on the principal international problems, mainly political and economic. The result of this enterprise was not so satisfactory as expected, and the weekly in question degenerated in less than a year into a periodical catering for the amusement of the public. Much the same fate was shared by the weekly undertaken by the Osaka Mainichi, another influential daily. It may be that the very fact that here in Japan the unit of the economic life of the people is the month, and not the week, stands between weeklies and their success.

LIST OF PRINCIPAL PERIODICALS

Politics and literature:
- Chuo Koron (Central Review)
- Kaizo (Reconstruction)
- Nippon Hyoron (Japanese Review)
- Bungéi Shunju (Literary Review)

CHAPTER XXXV

LITERATURE, ARTS AND MUSIC

Literature

History

Yamato Period The history of Japanese literature may be divided, in accordance with the political development of the country, into 6 periods : the Yamato, Héian, Kamakura, Muromachi, Yédo and Tokyo periods. The Yamato period comprises the Kodai (archaic period) and the Nara age that followed. The term, Yamato, is derived from the district of Yamato, Nara prefecture, wherein was the seat of the Imperial capital throughout that age. This nascent age of Japanese literature ended in 781 A. D., with the removal of the Imperial capital to Kyoto, then called Héian, by the Emperor Kammu. It may seem improper to include so long a period under one section, but this early stage of Japanese literary growth can thus conveniently be considered as one concrete age, and be studied as such.

(1) Literary Works. The literary works which reveal the mind of the Yamato period and which are still extant, are : the Kojiki, Nihonshoki, Fudoki, Norito, Senmyo, Mannyoshu, Kaifuso, and Nihonraiki. The principal writers are : Ohno-Yasumaro, Tonérishinno, Yamabé-no-Akahito, Kakinomotono-Hitomaro, Yamanoéno-Okura, Otomono-Yakamochi, Ohmino-Mifuné, besides certain sages of the prehistoric age. The last mentioned, Ohmino-Mifuné, was proficient in Chinese classics and poetry.

(2) Development and Classification. Narrative prose and lyric verse assumed concrete form in this period. From a literary point of view the writings of the period can be divided into two sections : works in descriptive style, of which the Kojiki is the main representative ; and poetry that followed, with the Mannyoshu[1] anthology as the typical poetic composition.

Individual self-consciousness realized meagre general development ; instead, a collective sense controlled society. But ample evidence of a pure national spirit is seen. In the latter part of this period alien ideas were introduced from China and India, but could not find their way deeply into the minds of the people. It is not to be wondered at, therefore, that the literary achievements of this awakening period are instinct with the noble national spirit of loyalty and ancestor-worship, permeated with the national traits of optimism, frankness, and genuine simplicity.

Héian Period The Héian period starts from the year in which the Emperor Kammu removed the Imperial palace to Kyoto, then called Héian, and ends in 1186 when the Shogunate government was established by Yoritomo Minamoto at Kamakura. This second literary period, covering nearly 400 years, following the period of dawn, saw Japanese prose and poetry reach full bloom.

Generally speaking, the literature of the period emerged from a style of clear-cut simplicity to one of elegance and delicacy, all literary productions assuming a mood of refined sentiment. In presentment likewise there appeared the graceful kana syllabary, in keeping with current ideas. This harmonization of content and form in the literature of the Héian period set an example to succeeding generations. The Héian period is thus the golden age of Japanese literary achievement. The

1 Mannyoshu (or Manyoshu). The anthology is considered to be one of the greatest poetical attainments of the nation not only in this period, but all through the history of Japanese literature. Its compiler is unknown. The period in which the poets of the book lived covers 450 years from 313 to 764 A. D., and the range of the social standard of the poets extends to all classes from the Emperor down to the farmer or the hermit. The book contains 4,496 poems, which consist of 262 long poems, 4,172 waka and 62 others. Their themes are taken from human relations, love, lamentation, the four seasons, and natural scenery. They are written in the Yamato dialect with Chinese characters. The eminent anthologists in it are Kakinomotono-Hitomaro of the epic long poems; Yamanouéno-okura of the long lyrics who took his themes from social and economic problems of his day; Yamabéno-akahito, the only nature poet among the group; Ohtomonoyakamochi who is believed by many critics to be the compiler of the book and Nukatano-ohogimi and Sakanoé-iratsumé, who distinctly tower above many poetesses who left beautiful love songs with the anthology to their posterity.

Digitized by Google

period may further be subdivided into the following four sections :

Early Héian period (781–884)
Middle Héian period (885–980)
Mature Héian period (981–1064)
Last Héian period (1065–1182)

(1) Early Héian Period. During this period, imported Chinese culture exercised no small influence on the literary circles of the country, resulting in the popularity of Chinese classics and poetry. Among the poetical works are the Ryounshu, Bunkashureishu, Kéikokushu, while among the authors were the Emperor Saga, Kukai, Onono-Takamura, Miyakono-Yoshika, Ōéno-Otondo, Sugawarano-Koréyoshi, Tachibanano-Hirosuké, Sugawarano-Michizané, Fujiwarano-Sukéyo and Miyoshi-Kiyoyuki. With the overwhelming influence wielded by these imitators in the domain of the newly imported Chinese literature, the Japanese waka (31-syllabled poem) was threatened at one time with relegation to obscurity. But the situation was saved through realization of a proposal from Sugawarano-Michizané to discontinue the customary visits of Government envoys to China. In consequence, Chinese literature gradually lost its former influence, and the eminent position once occupied by this alien form of belles-lettres was taken by Japanese poetry. The forerunner of the revived waka verse was the Rokkasen, a collaboration of six representative poets, namely, Ariwarano-Narihira, Ononо-Komachi, Bunyano-Yasuhidé, Kisenhoshi and Otomono-Kuronushi. A further literary achievement of the period is the appearance of works in the Japanese kana syllabary, such as the Takétori-monogatari and the Isé-monogatari.

(2) Middle Héian Period. This is the age of national consciousness when the waka poetry triumphed over Chinese forms, pushing itself forward like a tidal wave. In poetry, works like the Kokin-wakashu and Gosen-wakashu are prominent, while in fiction such works as the Utsubo and Ochikubo and Tosanikki, in Japanese kana syllabary, are representative products.

(3) Mature Héian Period. This is the period in which the literary development of the Héian era attained the highest perfection, creating a golden age of prose. In the field of waka we have such poets as Izumi-shikibu, Akazomé-Émon, Fujiwarano-Kinto, Fujiwara-Sanékata and Noin-hoshi, while in the realm of prose there appeared women novelists, like Murasaki-shikibu and Séisho-nagon, the former being the authoress of the Genji-monogatari,[1] while the latter composed the Makurano-soshi, opening up a literary régime of women, as if flowers of innumerable variety and colours blossomed all at one time.

(4) Last Héian Period. A general survey of the period gives the impression of its being politically transitional from Imperial rule to Shogunate administration. Along with the decline of the Fujiwara family in power, literature also hastened towards decline. And in consequence, in the early part of the period the literary cult turned from novels to historical works, producing the Éiga-monogatari and Okagami. In the realm of poetry also a new tendency was apparent, which gave birth to such noted poets as Toshinari Fujiwara and Saigyo-hoshi ; and at the same time a scientific criticism of poetry was initiated and prevailed under students like Mototoshi Fujiwara, Toshiyori Minamoto, and Kiyosuké Fujiwara.

(5) General Development. The most characteristic feature of the period lies in the movement from impromptu and lyrical poetry to stories and narration which require plots and objectification of things. The instinctive or primitive sentiment of the Mannyoshu precedes the more intellectual Kokinshu ; and the Shikashu that followed is pervaded by more meditative and philosophical reflections. With reference to prose, the myths and legends appearing in the Mannyoshu and Kiki (short for Kojiki and Nihonshoki) underwent mutation and took the form of narrative tales in the Takétori-monogatari and the Isémonogatari. This realistic tendency

1 Genji-monogatari. The author Murasaki-shikibu (975-1031) was born a daughter of Tamétoki Fujiwara, a family of the illustrious Fujiwara clan, and served at Court for some years as lady-in-waiting to the Empress Akiko. She is known as Lady Murasaki, but her personal name is not known. The book is a large one (nearly 1,900 pages in Arthur Waley's English translation), written in pure old Japanese, extremely refined and pregnant, with Japanese character, or kana, sentences, and literary critics agree in the opinion that it belongs to the greatest masterpieces of the novels of the world.

Genji-monogatari means the Tale of Genji, mainly a love story between the hero Genji and several heroines. It is also a most vivid picture of a civilization, nine hundred years ago, probably as refined, though in the central city only, and certainly as colourful, as any the world has ever known. The most striking thing about the book is the impression it creates upon us of its modernity and universality of feeling. It reflects the Oriental characteristics in every line and still shows human nature very much the same as the Occidental.

Digitized by Google

not but react on the taste and sentiment of the people, as is evidenced by the two different literary currents that prevailed throughout the period. whereas the so-called aristocratic literature, which dominated those days, stood on a foundation of Bushido and Confucianism, the popular literature strove to create the epicurian's world. Each of these tendencies went on cultivating its own field of influence in its own respective class, yet what most aptly represents the characteristic features of Yedo literature is the stronger public appeal of popular literary works. These intellectual diversions of the common people, unlike the traditional, conservative and retrogressive taste of classical literature, are optimistic, and charged with the spirit of uplift and mirth. But the negative policy of the Tokugawa government proved an impeding factor in the healthful growth of popular literature, resulting in a gradual loss of individuality. In this way authorship gradually kept aloof from essential requirements of progressive art; the most glaring example of this deplorable tendency is clearly noticeable in Bakin's works. (As to the development of literature in Meiji and Taisho eras see the Japan Year Book, 1938-39, p. 839.)

Literature in 1938-39

With the China Incident which broke out in July, 1937, assuming the characteristics of long-term resistance against Japan, under the rash policy of Chiang Kai-shek administration, the Japanese Government was compelled to embark on a policy of long-range campaign. To meet the requirements of a long-range campaign, the Japanese Government enforced far-reaching and increasingly strict control measures, affecting even thought and literature. Under the circumstances, it became an urgent question to thinkers and literary men to determine how they might best conform to the national policy. As days went by, the intellectuals in general began to appreciate the gravity of the situation more and more profoundly. During the latter part of 1938 and the early part of 1939 both thinkers and literary men decided to direct their energies to positively contribute toward the execution of national policy instead of merely conforming to the governmental control. While supporting the national policy from the standpoint of the general situation, the thinkers and literary men alike offered their criticisms regarding the details of the policy.

As an example mention might be made of the theory of "Cooperative Body of East Asia", a term which was coined to express the new order based on the economic and political cooperation among Japan, Manchoukuo and China. This term became popular among thinkers and literary men who gave ideological background and universality to the expression. On the ground that the new order, both political and economic, can be brought about only by the creation of a new culture, discussion centred round the nature of content of the new culture.

Generally speaking, the discussions made in the thought world centred on the view that the ideology which unifies Japan would be the best fitted to unify the Orient. From this viewpoint, what was needed was a shift in application from "Japan" to the "Orient". Simultaneously an extensive research was made into Japanese culture and Japanese idealism.

With regard to literary works, it must be observed that epoch-making works were published one after another. Ashihei Hino, a soldier who participated in actual warfare, rose suddenly into fame by his remarkable work "Barley and Soldiers" which is a record of events in the battle fields. Various literary works, some in the form of records and others as stories, followed in succession and were published in magazines or newspapers in Japan. On the other hand, there was a remarkable rise of peasant literature calling attention to the actual conditions prevailing in the agricultural villages and urging a shift to a more rational system or describing the conditions of Japanese agricultural villages in Manchoukuo. These literary works mostly took the form of long stories, particularly this was the case with regard to the outstanding works.

The tendency of literary works taking the form of long stories had been evident before, but it had been anticipated that the progress of the China Incident would cause the control over the use of paper to be strengthened to such an extent that the newspapers and magazines would be unable to provide enough space for such long stories. Actually, however, the control over the use of paper has not produced such effect upon the publishing world and the reading public has shown a preference to serious literature, which is contributing to the growing tendency toward publication of longer works.

The veteran literary men who had

Digitized by Google

followed. Herein we notice the beginnings of modern thought, the product of classicism evolving into modernism, and aristocracy into plebeianism. The Muromachi period thus occupies an important position in our literary history, functioning as a bridge that connects the preceding periods with the more illustrious Yédo literature. Another thing worthy of note in this connection is the creation at this time of the Kanazawa Bunko, the Ashikaga-gakko and the Gozen-bungaku, the first two being seats of learning and the last a branch of literature.

Yédo Period The Yédo period begins in 1603 when the Tokugawa Shogunate took up the task of civil government in Yédo, and ends, after 265 years, in 1868, when the Meiji Restoration was accomplished. This forms the most important section in the history of Japanese literature. The Yédo literature succeeded the decadent Muromachi literature and handed on its wealth of achievement to the Meiji period. The remarkable fecundity of this era is to be attributed to various factors, but to none more fundamental than the good government of Iyéyasu Tokugawa, the first Shogun of that line. Realizing the importance of the diffusion of learning for good government, he engaged Confucian scholars, published books, started schools and collected rare literary works. The example thus set by the first Shogun was emulated by the succeeding Shoguns, each striving to open up the way for easier access to knowledge and culture both in town and country, until in the Genroku Era under the rule of the fourth Shogun, Tsunayoshi, national culture reached its highest stage of development. The Yédo period may be divided into the following four sections : centered around Osaka and Kyoto,

1. Period of enlightenment (1603–1680)
2. Period of development (1681–1741) Yédo as the centre,
3. The period of eastward advance of literature (1741–1791)
4. Period of maturity (1791–1868)

(1) Period of Enlightenment. True to its name, this period, following the establishment of the Tokugawa Shogunate in Yédo, saw the collection and publication of ancient books, and annotations thereof, as well as translations of Chinese literature. It is but natural that during this period nothing worthy of note was produced save as foundation work in preparation for what was to come. From another viewpoint this is the age when our traditionally mystic view of art, and our undue belief in tradition, greatly wanes in influence.

(2) Period of Development. A bird's-eye view of the period gives the impression of a rapid development in popular literature, with Osaka and Kyoto as the centre and the Genroku Era as its climax. The origin of this literary movement is traceable to the Mitogaku, which later led to a renaissance of the classics ; we see a revival of haikai verse under Basho, the poet ; and then the appearance of Chikamatsu's joruri. Each made unfettered development within its own sphere of influence. Towards the close of the period, however, these branches of literature lost popularity, until eventually they could scarcely enjoy public recollection.

(3) Eastward Advance of Literature. This is the period when the so-called Kamigata literature of Kyoto and Osaka, began its movement eastward to establish a new literary movement in the city of Yédo, the seat of the Shogun's government. By this time the popular literature founded by Chikamatsu and Saikaku had declined. Buson became the representative haikai poet of the time. Besides haikai, there came into vogue in Yédo various kinds of short poetry, namely, senryu, witty epigrammatic verse ; kyoka, comic verse ; and kyobun, nonsense notes. Also in this period the so-called literature for men of the world cropped up, following the publication of the kibyoshi and sharébon.

(4) Period of Maturity. It was in this period that the construction of the main body of Yédo literature was completed. As a result of the encouragement of learning by the Shogun's highest official, Sadanobu Matsudaira, both art and learning made a remarkable advance, producing a number of artists, and authorities on Japanese and Chinese classics. Parallel with this phenomenal development of classics, popular literature resumed its firm grip on the public. Inasmuch, however, as during the latter half of the period the country was completely upset by troubles both from within and without, most of the literary progress was confined to the early part of the period. Nevertheless, this is known as the period when Yédo literature was crowned with full maturity.

What most characterize Yédo literature are its fecundity in kinds, volume of production and sphere of influence. Not only was it prolific but, all branches of art and learning, from the aristocratic classics down to kyoka, senryu, haikai, joruri (gidayu) and popular novels, showed systematic advancement. The social structure in those days could

Digitized by Google

not but react on the taste and sentiment of the people, as is evidenced by the two different literary currents that prevailed throughout the period. whereas the so-called aristocratic literature, which dominated those days, stood on a foundation of Bushido and Confucianism, the popular literature strove to create the epicurian's world. Each of these tendencies went on cultivating its own field of influence in its own respective class, yet what most aptly represents the characteristic features of Yédo literature is the stronger public appeal of popular literary works. These intellectual diversions of the common people, unlike the traditional, conservative and retrogressive taste of classical literature, are optimistic, and charged with the spirit of uplift and mirth. But the negative policy of the Tokugawa government proved an impeding factor in the healthful growth of popular literature, resulting in a gradual loss of individuality. In this way authorship gradually kept aloof from essential requirements of progressive art; the most glaring example of this deplorable tendency is clearly noticeable in Bakin's works. (As to the development of literature in Meiji and Taisho eras see the Japan Year Book, 1938-39, p. 839.)

Literature in 1938–39

With the China Incident which broke out in July, 1937, assuming the characteristics of long-term resistance against Japan, under the rash policy of Chiang Kai-shek administration, the Japanese Government was compelled to embark on a policy of long-range campaign. To meet the requirements of a long-range campaign, the Japanese Government enforced far-reaching and increasingly strict control measures, affecting even thought and literature. Under the circumstances, it became an urgent question to thinkers and literary men to determine how they might best conform to the national policy. As days went by, the intellectuals in general began to appreciate the gravity of the situation more and more profoundly. During the latter part of 1938 and the early part of 1939 both thinkers and literary men decided to direct their energies to positively contribute toward the execution of national policy instead of merely conforming to the governmental control. While supporting the national policy from the standpoint of the general situation, the thinkers and literary men alike offered their criticisms regarding the details of the policy.

As an example mention might be made of the theory of "Cooperative Body of East Asia", a term which was coined to express the new order based on the economic and political cooperation among Japan, Manchoukuo and China. This term became popular among thinkers and literary men who gave ideological background and universality to the expression. On the ground that the new order, both political and economic, can be brought about only by the creation of a new culture, discussion centred round the nature of content of the new culture.

Generally speaking, the discussions made in the thought world centred on the view that the ideology which unifies Japan would be the best fitted to unify the Orient. From this viewpoint, what was needed was a shift in application from "Japan" to the "Orient". Simultaneously an extensive research was made into Japanese culture and Japanese idealism.

With regard to literary works, it must be observed that epoch-making works were published one after another. Ashihei Hino, a soldier who participated in actual warfare, rose suddenly into fame by his remarkable work "Barley and Soldiers" which is a record of events in the battle fields. Various literary works, some in the form of records and others as stories, followed in succession and were published in magazines or newspapers in Japan. On the other hand, there was a remarkable rise of peasant literature calling attention to the actual conditions prevailing in the agricultural villages and urging a shift to a more rational system or describing the conditions of Japanese agricultural villages in Manchoukuo. These literary works mostly took the form of long stories, particularly this was the case with regard to the outstanding works.

The tendency of literary works taking the form of long stories had been evident before, but it had been anticipated that the progress of the China Incident would cause the control over the use of paper to be strengthened to such an extent that the newspapers and magazines would be unable to provide enough space for such long stories. Actually, however, the control over the use of paper has not produced such effect upon the publishing world and the reading public has shown a preference to serious literature, which is contributing to the growing tendency toward publication of longer works.

The veteran literary men who had

Digitized by Google

feeling of security under the new order. The story centres round the experiences of the village girl.

Both of the above-mentioned works are excellent literary productions but what enhances their value is that they brought into being what is known as "battle-front literature."

September 11 — The rendering into contemporary Japanese of the Genjimonogatari (Tale of Genji), which is reputed to be the cream of the classical literature of Japan, was accomplished by Junichiro Tanizaki, senior member of the literary world in the country, who came out of his rural cottage to Tokyo, carrying with him the historic manuscripts. (The new version of the classical work was later published in January, 1939, by the Chu-o Koron Sha.) The specific merit of the new version lies in the fact that the literary elegance and beauty of the original work were ably reproduced into the contemporary Japanese. Lady Murasaki, that gifted author of the Genjimonogatari had the peculiar gift of expressing so much sentiment in such few words that it always presented the greatest difficulties to the translator. It toook five years for the noted writer to complete the translation.

On the same day, the personnel of the literary party to be dispatched to the battle-front to observe the conditions of the impending fall of Hankow into the hands of Japanese forces was determined. The party was divided into two groups. One of the groups was to join the advancing troops and was composed of Masao Kume, Matsutaro Kawaguchi, Kunio Kishida, Teppei Kataoka, Shiro Ozaki, Kosaku Takii, Uyio Tomizawa, Takao Nakatani, Fumio Niwa, Kyuya Fukuda, Akira Asano, Sonosuke Sato and Fumiko Hayashi. The other group was to join the naval units sailing up the Yangtze River and was composed of Kan Kikuchi, Eiji Yoshikawa, Nobuko Yoshiya, Haruo Sato, Komatsu Kitamura, Heisuke Sugiyama, Masajiro Kojima and Hiroshi Hamamoto. (The party departed for the front within a few days and was followed by another consisting of composers and poets including Yaso Saijo, Takao Saiki, Yuji Kozeki, Nobuo Iida and Shiro Fukai.

September 26 — A German exchange student studying at the literary department of the Tokyo Imperial University, completed a German version of the "Inochi-no-Shoya" (Evening of Life) by Tamio Hojo. The German student, a graduate of the law department of the Munich University, had been in Japan for only 10 months when he was able to converse freely in Japanese language. He had read many literary works including some by Kafu Nagai and Yuzo Yamamoto when he resolved to prepare a German version of the "Inochi-no-Shoya" which is composed of notes by a leper because it moved him most profoundly. The translation was completed in three months and after being corrected by Hiroo Suga of the German-Japanese Cultural Society was decided to be published in the "Nippon," a magazine published in Berlin by the German-Japanese Cultural Society.

September 29—With the assistance of the Italian Government, the first number of the "Itariya" (Italy), a magazine aiming at the exchange of the cultures of Japan and Italy, was published. The publication of the magazine is one of the undertakings of the Itariya-sha, an organization which was formed in Tokyo with the object of exchanging the cultures of Japan and Italy when the Italian goodwill mission visited Japan in the spring of 1938. Premier Mussolini of Italy sent in his autographed photograph in commemoration of the publication of the magazine. The contents of the magazine comprised articles on culture, education, art and other subjects pertaining to the two countries. The cover of the magazine contained a photogravure showing a part of the fresco of Michael Angelo in the Vatican Palace.

October 18—Fumiko Hayashi who, as already stated, had joined the troops advancing on Hankow, was the first Japanese woman to enter the city of Hankow which had fallen into the hands of Japanese forces. For more than a month she had to travel on foot with the advancing soldiers before she reached the principal city in Central China. The news of her valiant adventure aroused great admiration among the people at home in Japan.

October 26 — An "Evening of War Poems" was held in honour of the sick and wounded soldiers under the auspices of the Tokyo Poets' Club.

October 31—Fumiko Hayashi returned to Tokyo from the Hankow battle-front. She recounted the difficulty of accompanying the fighting forces and expressed gratitude to the officers and men and also told of her rejoicings over the entry of the fighting forces into Hankow which she described as a very impressive event. Together with a few other persons who had also accompanied the fighting forces, she attended a lecture meeting and impressed her au-

Digitized by Google

dience by recounting her various observations, among which was the narrative of an officer continuing to give command while dying of a serious wound on a transport in which she journeyed.

November 2—With the assistance of the publicity department of the Ministry of the Navy, the second party of literary men was formed to proceed to the battlefront. The party included Shin Hasegawa, Seiji Haji, Burao Nakamura, Saburo Koga and Kunizo Minato, all writers of popular novels; Jiro Sekiguchi and Eijiro Hirose, both playwrights; Aisei Nomura, writer of juvenile novels; Kiyoshi Koishi, photograph artist, and Kijihiko Amano, writer of nursery stories. They decided to depart in four or five days.

About that time, the remaining members of the first party of literary men returned from the battle-front.

November 7—A meeting was held to promote peasant literature, attended by Count Rainei Arima, Minister of Agriculture and Forestry. Among others present at the meeting were Kensaku Shimaki and Den Wada. The consultations centred round the methods for the promotion of peasant literature.

November 25—As a result of the meeting held on November 7, a society for the promotion of peasant litrature was brought into existence. Among those attending the inaugural meeting of the society were Muraji Uchiki, Choku Tokunaga, Chiaki Shimomura, Sachiko Kusumoto, Itaru Nii, Yoshiji Maruyama and Kei Moriyama. For the promotion of its objective the society undertakes to publish books and has instituted a prize for the best work dealing with peasant life and in addition holds lecture meetings from time to time.

December 8—The Kitamura Tokoku prize which was created in commemoration of Tokoku Kitamura, the literary genius of the Meiji period who died young, was decided to be awarded to Yojuro Yasuda for his work entitled "Taikan-Shijin no Goichininsha" (peer of the crowned poets). The prize was thus being awarded for the second time.

Middle Part of December—It was announced that preparations were under way for the publication of a German version of the Mannyoshu (or Manyoshu), an anthology which is generally considered as the greatest of the classical Japanese literary works. The English version of the masterpiece had already been published some time ago. The German version was being prepared with the cooperation of Japanese and German scholars of the Mannyoshu, including Dr. Nobutsuna Sasaki, a poet; Dr. Kinji Kimura, professor of the Tokyo Imperial University, and Dr. Zachert, teacher at the Matsumoto High School. They resolved to select some 4,500 poems from the voluminous original work for translation which is scheduled to be completed in two years.

Dr. Sasaki was appointed to take charge of interpretation of the original while Dr. Zachert was appointed to render it into German, while Dr. Kimura was entrusted with the work of correcting the translation.

It was revealed that Chang Wen-hua, Chinese teacher at the Kagoshima Business School, was preparing a Chinese version Ashihei Hino's "Mugi-to-Heitai" (Barley and Soldiers) and the "Tsuchi-to-Heitai" (Soil and Soldiers). Chang Wen-hua had once served as professor of the Honan University and is a brilliant young Chinese scholar. He decided to complete the translation by the spring of 1940.

The leading critics were holding a series of meetings to discuss the ways and means of rendering their cooperation in dealing with the current situation. Among the promoters of the scheme were Kiyoshi Miki, Takanobu Murofushi, Retsu Kiyosawa, Kojiro Sugimori, Kamekichi Takahashi, Seijun Yamazaki, Masanori Ito and Itaru Nii. They decided to arouse public interest through their writings.

Latter Part of December—The Bungakuza, Shin Tsukiji Gekidan, Shinkyo Gekidan, the three theatrical organizations which have for its aim the perfection of the new school of acting in the country on the basis of the more orthodox tradition, advanced to the Yurakuza play-house which had hitherto been monopolized by the professional kabuki play companies and commercial new school play companies. The advance of the organizations which are semi-amateur enterprises was very successful, playing to a full house day after day, which shows the great future of the organizations as well as the popular support for the new school of acting.

January, 1939—Ashihei Hino who had published his popular works entitled "Mugi-to-Heitai" (Barley and Soldiers) and "Tsuchi-to-Heitai" (Soil and Soldiers) wrote another work entitled "Hana-to-Heitai" (Flowers and Soldiers) which began to appear serially in the Tokyo Asahi Shimbun and the Osaka Asahi Shimbun while another work by the same author entitled "Umi-to-Heitai" (Sea and Soldiers)

Digitized by Google

appeared in the Tokyo Nichi Nichi Shimbun and the Osaka Mainichi Shimbun. The successive publication of such long stories roused admiration for the creative genius of the author serving at the front.

January 13—A Continental Literary Society was organized with the cooperation of the Ministry of Overseas Affairs for the purpose of promoting the knowledge of the conditions in Manchoukuo and North China. The inaugural meeting was attended by many writers including Ki Araki, Sei Ito, Kiyoto Fukuda and Jun Takami and representatives of the Overseas Office. The consultation held among those concerned resulted in an agreement whereby the Overseas Ministry will extend facilities to literary men visiting Manchoukuo and North China and a prize was instituted by the Overseas Minister to be awarded for the best work dealing with colonization. It was also decided to present such literary works in the form of dramas and movies.

January 18—Bungei Koa Kai, an association of literary men for the promotion of the prosperity of Asia, was inaugurated. The membership included 40 persons, among them being Kan Kikuchi, Jiro Osaragi, Eiji Yoshikawa, Masao Kume, Shin Hasegawa, Shiro Ozaki and Haruo Sato. The association undertakes to make researches with a view to the creation of a new East Asian culture, by sending literary men to the continent for inspection purposes or for accompanying the fighting forces, and to make proposals or render cooperation to the Government in connection with governmental schemes concerning continental culture. It also undertakes to introduce the actual conditions prevailing in East Asia to foreign countries by the publication of literary works or by other means.

February 10—The two recipients of the literary prize given by the Shinchosha were determined. One of them was Einosuke Ito who was awarded the prize for his work entitled "Ugui-su" (Nightingale). A composition classed as pure literature, it describes the simple life in the agricultural community through a day's events at a country police substation and has much pathos and humour. Another recipient was Joji Tsubota who was selected for his work entitled "Kodomo-no-Shiki" (Children's Calendar). This piece of popular literature is a light and bright story having for its theme the life of children. It deals with the strong life force of children which overcomes the rough dealings of the world.

In this connection, it must be noticed that according to the old distinction between pure literature and popular literature, the "Kodomo-no-Shiki" would have to be considered as a piece of pure literature. It was selected for the award of the literary prize as a piece of popular literature on the basis of the opinion that literary works which are easy of comprehension and which are meant for the general mass of people should be regarded as popular literature.

February 12—The recipients of the Akutagawa prize and the Naoki prize for the year 1939 were determined. The Akutagawa prize was awarded to Tsuneko Nakazato for her work entitled "Noriai Basha" (Omnibus). She was the first woman to win the prize. A popular writer, she was 31 when she received the prize. Tadao Ohike was chosen for the Naoki prize for his works entitled "Akita-kuchi no Kyodai" (Brothers of Akita-guchi) and "Kabuto-kubi" (The Helmet).

The recipient of the prize for a poetical work given by the magazine Bungei Hanron was determined. The selection of the prize winner was made by such first-rate poets as Sakutaro Hagiwara, Daigaku Horiguchi, Haruo Sato and Soji Momota. It was decided to award the prize to Hideto Nakano for his work entitled "Seikatai (The Choir).

February 22—As the result of a series of consultations held since the latter part of 1938, an Association of Critics was inaugurated with Soho Tokutomi and Setsurei Miyake as its honorary members. The membership included a total of 150 critics on cultural, social, political, economic and literary affairs. The association undertakes to rouse public opinion in regard to the current situation, by holding lecture meetings and research meetings and publishing pamphlets.

The Takushoku Bungaku Konwakai (Colonization Literature Consultation Society), for the organization of which preparations had been made for several months past, was inaugurated. More than 20 authors including Choku Tokunaga, Kojiro Serizawa, Jun Sakakiyama, Kenji Ohye, Yukio Haruyama, Taiji Tamura, Kunio Kishida, Sei Ito, Jun Takami and Kakuchu Cho (of Korea) attended the inaugural meeting which was held in the presence of Director Yasui of the Colonization Bureau of the Ministry of Overseas Affairs.

February 23—The Kikuchi Kan prize instituted by the Association for the

February 23—The Kikuchi Kan prize instituted by the Association for the

Digitized by Google

Promotion of Japanese Literature was decided to be awarded to Shusei Tokuda. The prize consists of a monetary gift and a memento. The Kikuchi Kan prize is awarded to authors of above 46 years of age for an outstanding contribution in literary field within the period of a year preceding the award. The selection of the prize winner is made by authors under 46 years of age.

A new literary prize was created by the Cultural Association of Japan for the purpose of promoting literary works on Japanese culture. The association requested the authorities of the Ministry of War, the Ministry of the Navy, the Ministry of Home Affairs, the Ministry of Overseas Affairs and the Ministry of Agriculture and Forestry as well as the leading literary men to recommend names for the award of the prize. The selection committee consists of nine persons including Zenro Nagayo, Hyakuzo Kurota and Saneatsu Mushakoji.

Principal Literary Works Published During Past One Year

Tamio Hojo's "Doke-shibai" (farce), Published in April—This work describes the miserable life of a marxist who has changed his ideas. The story relates his conversation with his junior friend (who was declared a leper when he was hardly 20 and is now an inmate of a leper-asylum). The two drink while chatting and as they become drunk, each sighs over the other's inability to understand his sufferings. The discussion deals with the old and yet always new question: "What is life?" It is a powerful work depicting the instinctive force of life as well as the feeling of powerlessness before nature.

(The author was declared a leper while still very young and, during his life as an inmate of a leper-house, wrote many works including one entitled "Inochi-no-Shoya" (On the Eve of New Life). After the completion of the "Doke-shibai," he died, his disease becoming worse.

Seizaburo Yamada's "Jigo Zange" (Whispered Confession), Published in June—The story describes how the leader of a class war, during his term in prison, changes his mind and becomes an advocate of racial struggle. The frank confession commends itself to the reader.

Einosuke Ito's "Uguisu" (Japanese Nightingale), Published in June—It describes the events which occurred at a police substation in a country district. By observing people coming or taken to the police substation, the author criticizes the pitiable life and the low standard of culture in an out-of-the-way village in Japan. It is interspersed with humourous interludes.

Rintaro Takeda's "Kusa-no-Ashita" (Morning Grass), Published in June—It describes how a young girl working at night in order to make a living leaves for a walk early in the morning, symbolizing her rebirth from corruption. This work aroused great expectations for the author's future works.

Mantaro Kubota's "Hana-biye" (Chilly Flowers), Published in June—This work describes the scenes in the streets of Tokyo, which are a mixture of the time-honoured traditions of the past and the new rhythm and clamour of modern times. With his love for the old traditions the author dreams of the past and sighs for the things that are no more.

Fumiko Hayashi's "Hototogisu" (Cuckoo), Published in June—This work describes the desperate life of a woman whose face is disfigured by a blue mark, thus raising a serious feminine problem.

Takeo Oda's "Hyohaku no Ro Jin" (Wandering Lu Hsun), Published in July—This work is a short story describing the lonely life of Lu Hsun a chinese scholar, during his tenure as professor of the Amoy University. It well illustrates the tragedy of the far-sighted Chinese scholar who felt a stranger in his own land.

Toshiko Sato's "Karifornia Monogatari" (A Californian Tale), Published in July—The story begins with various events which occur in regard to the love and marriage of an American girl of Japanese extraction. The story hints that it may be Japanese rather than foreigners who do not appreciate the position of the so-called second generation.

Kenji Ohye's "Imin-igo" (After Immigration), Published in July—It describes the life of those who have gone to Sao Paulo in Brazil to work in coffee plantations, and tells of how they are hit by a slump in the coffee market and abandon the cultivated areas they used to live in , in order to migrate to the interior. The impellent force of this work lies in the fact that it again calls attention to the voice of the Japanese residents abroad at a time when the entire nation turns its attention to the China affair.

Uyio Tomisawa's "Fufu" (Man and Wife), Published in July—This is a story about the self-sacrificing spirit of

Digitized by Google

be roughly classified into human figures, birds and animals, architectural structures, household articles and arms.

Asuka Period As has been stated in the preceding section, for sometime after the foundation of the Empire by the Emperor Jimmu, there was nothing worthy of mention in the realm of art. The Asuka period covers the reign of the Empress Suiko (592–629), when the Imperial palace was in the province of Yamato, Nara prefecture. Already, as early as the time of the Emperor Yuryaku, in the middle of the 5th century, a painter named Isura came over from Chosen, with which country Japan then had frequent intercourse, and through which Chinese civilization had been introduced. Later, during the reign of the Emperor Sushun, towards the end of the 6th century, another painter called Hakka came with carpenters to build temples. But it was not until Shibatatto came over from China, in the reign of the Emperor Keitai (507–531), that Buddhism was introduced into Japan, despite the fact that communication had long before continued with Chosen, then called Kudara.

Shibatatto must have been an expert in the art of sculpture, for he was the grandfather of Kuratsu-kurinotori who cast the large image of Buddha now in the Horyuji temple, in the Empress Suiko's time. Nevertheless, it is evident that the country which contributed most toward founding Japan's fine art technique was Kudara.

The development of art in the Suiko régime was really wonderful. Prince Shotoku, a man of wide learning and an enthusiastic devotee of Buddha, spurred on the ever increasing devotion to art. The leading structures of the period were the Horyuji and Tennoji temples; but those parts of them that have best withstood the wear and tear of time are the two-storied kondo, gate, the five-storied pagoda of the Horyuji temple and the three-storied pagodas of the Horyuji and Horinji temples. No doubt the creative design of the Prince must have been woven into them, but it is nevertheless true that they were modelled after Kudara architecture. It is only from these structures that one can form any idea of what Chinese architecture in those days might have been. The Tamamushi-no-zushi, (a miniature temple) in the Horyuji temple, is valuable not only as a model of ancient architecture but as an example of the structural art and craft of the Suiko régime. The honeysuckle design on the metal fittings of the miniature temple bears close resemblance to similar art motives of Greece. The sculptures of the Suiko period are not all from one source, some coming from China or Chosen, while others are home creations, either from the hands of Chinese sculptors, or the combined efforts of Japanese and naturalized aliens.

The fine art of the Suiko period has thus great depth and width, and at the same time affords invaluable reference for study.

Hakuho Period In the history of Japanese fine art, following the Suiko Era comes the Hakuho period which starts in the reign of the Emperor Jomei, terminating in that of the Emperor Mommu, 629–697. In the 15th year of the reign of the Empress Suiko the custom of sending a government envoy to China, then called Sui, was established, followed by increased intercourse between the two countries. Later, in the 2nd year of the Emperor Jomei's administration, the first envoy was despatched to the T'ang Court in China. By the establishment of this custom art products of China came direct to Japan instead of through the Korean Peninsula, as they had done up to that time. Moreover, the Taika Reformation, by which the political system of China came to be closely followed from the time of the Emperor Kotoku, contributed much toward developing Hakuho art.

(1) Painting. One of the most outstanding facts in the art of this period is that paintings were imported from the Continent, and Buddhist pictures were painted by priests from China and India. The mural paintings of the kondo of the Horyuji temple testify to this; Its fresco work is further advanced in technique than that of India, and is prized as the leading example of mural painting in any extant wooden building. This and other examples of imported pictorial art technique during the period eloquently speak of the inflow from Indian sources into Oriental countries.

(2) Bronze. The most representative work of the period consists in the big bronze images of Buddha and the two disciples at the Yakushiji temple at Nara. Upon their pedestals are engraved a hoshokumon design in lieu of honeysuckle which by that time had ceased to command preference. The hoshokumon design is the art of inlaying or setting jewels in necklaces, armlets, pedestals, and halos around the heads of images. In connection with the Yakushiji temple's three images, it is interesting to notice that, side by side with the hoshokumon, there is an engraving of arabesque design in grapes. This grape pattern also has its origin in the

December—This is the work of an author who accompanied the fighting forces to Hankow. The story is skilfully told, with notes in the form of entries in a diary inserted here and there.

Yoshio Toyoshima's "Zaigaku Riyu" (Why in School) and "Ri Ei Tai" (name of a person), both Published in December—The peculiarities of the Koreans and the circumstances under which Korean students live in Tokyo are described in these works. The author displays his skill in picturing the Koreans who often lead a lonely life and yet have a bright and happy outlook.

Kanoko Okamoto's "Marunouchi Sowa" (A Scene in Marunouchi), Published in December—This is a picture of the peculiar mannerisms of the various classes of people in Tokyo. The story centres around Marunouchi, centre of the metropolis, and delineates the mode of life of the people moving about in that area.

Den Wada's "Seikatsu-no-Sakazuki" (The Cup of Life), Published in book form in December—This work describes the changes in agricultural villages in the form of a dialogue between father and son. It describes the process of the old naturally yielding to the new or the transition from ignorance and blind faith to wisdom and rationalism.

Kaju Hayama's "Umi to Yama to" (Sea and Mountain), Published in January, 1939—The story begins with the arrival at a port of a certain young man wishing to go to sea and then describes his seafaring life. It is interesting enough as a story. The dialogue between the characters is expressive of a simple life. It is regarded a masterpiece of literature.

Tatsuzo Ishikawa's "Bukan Sakusen" (Operations in the Wuhan Area), Published in January—The author represented the Chuo Koron (Central Review) in the literary delegation which accompanied the fighting forces to Hankow and this work is a result of his observations at the battle-front.

Fine Arts

History

Pre-Asuka Period This period, corresponding to what is called the dark age of art, has nothing specially to describe, although it is perhaps the longest period, extending, as it does, from the age of myths down to about the 7th century, A.D.

According to archaeology the ancient Japanese worked in stone, artifacts such as stone images being used in ancestor worship. These are rough hewn sculptures, representing persons clad in armour, wearing a sword, or other arms, all having been used in burial as guardians of the tomb. It was customary, too, in ancient times to have a similar primitive engraving, in the form of a ladder or a wheel, made on the coffin; the plain, artless impression thus conveyed is expressive of the simple mode of living in that remote age.

The dwellings were also in very simple style, constructed of barked but unhewn timber. Even in this simplest type of building there were two styles, known as the Izumo and the Isé; which implies that the ancient culture of Japan was dual, derived either from Izumo or Isé. The former style of structure is represented by the Izumo Shrine, Izumo province, present Shimané prefecture; and the latter by the great shrine of Isé, although these now give no more than a vague idea of what must have been the prehistoric architecture of the country.

In addition to the above, there are earthen figures called haniwa which arrest the attention not only of archaeologists but also of artists. According to historical records, the Emperor Suinin, who abdicated in 2 B.C., abhorred the cruel old custom of burying people alive around the grave of a high personage, certain individuals being selected from among those persons who were under patronage of the deceased in life. At the instance of a retainer, Nomino-Sukuné, he caused earthen figures to be interred in place of living persons, when the Empress Hihasuhimé died; and this was the origin of haniwa. It is believable, however, that the haniwa existed before Suinin's time. The haniwa is, from an artistic point of view, by no means of high value. It is, nevertheless, the only art product of Japan before the importation of Buddhism. Moreover, its value rests on the fact that it is a work produced solely by the Japanese before they had been influenced by Chinese art. Besides, it is invaluable in that it gives some idea of the life of the people of its day. The variety of haniwa may

Digitized by Google

be roughly classified into human figures, birds and animals, architectural structures, household articles and arms.

Asuka Period As has been stated in the preceding section, for sometime after the foundation of the Empire by the Emperor Jimmu, there was nothing worthy of mention in the realm of art. The Asuka period covers the reign of the Empress Suiko (592–629), when the Imperial palace was in the province of Yamato, Nara prefecture. Already, as early as the time of the Emperor Yuryaku, in the middle of the 5th century, a painter named Isura came over from Chosen, with which country Japan then had frequent intercourse, and through which Chinese civilization had been introduced. Later, during the reign of the Emperor Sushun, towards the end of the 6th century, another painter called Hakka came with carpenters to build temples. But it was not until Shibatatto came over from China, in the reign of the Emperor Keitai (507–531), that Buddhism was introduced into Japan, despite the fact that communication had long before continued with Chosen, then called Kudara.

Shibatatto must have been an expert in the art of sculpture, for he was the grandfather of Kuratsu-kurinotori who cast the large image of Buddha now in the Horyuji temple, in the Empress Suiko's time. Nevertheless, it is evident that the country which contributed most toward founding Japan's fine art technique was Kudara.

The development of art in the Suiko régime was really wonderful. Prince Shotoku, a man of wide learning and an enthusiastic devotee of Buddha, spurred on the ever increasing devotion to art. The leading structures of the period were the Horyuji and Tennoji temples; but those parts of them that have best withstood the wear and tear of time are the two-storied kondo, gate, the five-storied pagoda of the Horyuji temple and the three-storied pagodas of the Horyuji and Horinji temples. No doubt the creative design of the Prince must have been woven into them, but it is nevertheless true that they were modelled after Kudara architecture. It is only from these structures that one can form any idea of what Chinese architecture in those days might have been. The Tamamushi-no-zushi, (a miniature temple) in the Horyuji temple, is valuable not only as a model of ancient architecture but as an example of the structural art and craft of the Suiko régime. The honeysuckle design on the metal fittings of the miniature temple bears close resemblance to similar art motives of Greece. The sculptures of the Suiko period are not all from one source, some coming from China or Chosen, while others are home creations, either from the hands of Chinese sculptors, or the combined efforts of Japanese and naturalized aliens.

The fine art of the Suiko period has thus great depth and width, and at the same time affords invaluable reference for study.

Hakuho Period In the history of Japanese fine art, following the Suiko Era comes the Hakuho period which starts in the reign of the Emperor Jomei, terminating in that of the Emperor Mommu, 629–697. In the 15th year of the reign of the Empress Suiko the custom of sending a government envoy to China, then called Sui, was established, followed by increased intercourse between the two countries. Later, in the 2nd year of the Emperor Jomei's administration, the first envoy was despatched to the T'ang Court in China. By the establishment of this custom art products of China came direct to Japan instead of through the Korean Peninsula, as they had done up to that time. Moreover, the Taika Reformation, by which the political system of China came to be closely followed from the time of the Emperor Kotoku, contributed much toward developing Hakuho art.

(1) Painting. One of the most outstanding facts in the art of this period is that paintings were imported from the Continent, and Buddhist pictures were painted by priests from China and India. The mural paintings of the kondo of the Horyuji temple testify to this; Its fresco work is further advanced in technique than that of India, and is prized as the leading example of mural painting in any extant wooden building. This and other examples of imported pictorial art technique during the period eloquently speak of the inflow from Indian sources into Oriental countries.

(2) Bronze. The most representative work of the period consists in the big bronze images of Buddha and the two disciples at the Yakushiji temple at Nara. Upon their pedestals are engraved a hoshokumon design in lieu of honeysuckle which by that time had ceased to command preference. The hoshokumon design is the art of inlaying or setting jewels in necklaces, armlets, pedestals, and halos around the heads of images. In connection with the Yakushiji temple's three images, it is interesting to notice that, side by side with the hoshokumon, there is an engraving of arabesque design in grapes. This grape pattern also has its origin in the

Digitized by Google

of despatching envoys to China, thereby cutting off facility of communications with the continent. During the consequent isolation Japanese art was afforded a chance to cultivate its native genius and its own field of influence. The continental art that had been freely absorbed and adopted up to that time commenced to produce national characteristics as is demonstrated by yamatoyé work in the sphere of painting.

(1) Painting. Koséno-Kanaoka was probably the most skilled landscape painter of the period. His reputation was such that the horse he painted on a paper sliding-door was credited with getting out of the screen at night to feed on bush clover in the yard. Koseno-Hirotaka, a well-known painter, was one of his descendants. As skilled painters of that age we may mention also Motomitsu Fujiwara, Mitsunaga Fujiwara, Takayoshi Fujiwara and his son Takachika, besides Toba-sojo and Kakuyu, all of whom specialized in painting yamatoyé or native style, which had developed from a school in the T'ang period of China, called Karayé. Japanese paper-doors and folding screens were what they selected to paint on.

Besides yamatoyé many other schools of Japanese style paintings were started, as the kamiyé, utayé, ashideyé, and okoyé. The last mentioned was a school of comic genius whose premier artist was Toba-sojo, a noted priest of the day. Three albums of comic pictures from his brush are treasured at the Kozanji temple. Another important arrival was the yémakimono (paper-scroll) which later developed until reaching its golden age in the Kamakura period. The aforementioned three artists were the most popular masters of the age. Some of their work still survives.

Consequent upon the ever inculcated Buddhist precepts, Buddhist paintings flourished, so much so that specialists in that art were always in evidence. In this religious sphere of painting also national characterization was effected to no meagre extent. The most outstanding of the Japanized Buddhist schools was named the Eshinfu, started by Eshinsodzu, a priest, first affiliated with the Tendai sect of Buddhism, but who later preached the doctrines of the Jodo sect. Probably this school was second to none at that time in Japanization of technique. Taméto, commonly called Great Takuma, who did the fresco work of the Ho-o-do at Uji, Kyoto, belonged to the Takuma family, producing accomplished painters of the time. The most representative Buddhist paintings are treasured at the Hokkéji, Yamashiro Chohoji, Yamato Horinji, Koyasan, the Toji temples and the Imperial Art Museum of Tokyo.

(2) Sculpture. Remarkable advancement in the realm of Buddhist sculpture was revealed in consequence of effective doctrinal propaganda by the Tendai and Shingon sects. Wood-engraving stood unrivalled, but that art, unlike the same mode of the previous age, was mainly in what is called parquetry work. Sculptors collaborated, and in most cases images were constructed in separate parts, each carved by a different artist, under an accomplished specialist. It is interesting to note that even in the carving of hands, feet, head and body there was a division of labour into smaller parts, and each section was put in charge of one sculptor. When completed, the several parts were put together, painted with lacquer and gilded.

Guilds of sculptors, like the shichijo-bussho, Shichijo-omiya-bussho, Rokujo-marikoji-bussho and Sanjo-bussho, established studios one after another. Especially noteworthy in this field was the Shichijo-bussho started by the famous artist Jocho who was practically supreme in the realm of sculpture in the Fujiwara period. The peculiarity of the Jocho school of his creation lies in its soft, mild features with smooth, elegant textile folds or plaits, which characterize the most glorious period of Fujiwara art. The images of Amitabha enshrined at the Ho-o-do, Hokaiji, Saikyoji and Chusonji temples are all representative works of the Fujiwara period.

(3) Architecture. Along with the development of Japanese style painting, a new Japanese architecture, as seen in what is called the Shinden-zukuri (main building of a peer's residence), prevailed. This style gradually encroached on the domain of sacred structures, as is well exemplified in the Ho-o-do and Konjikido, above cited.

Within three hundred years after the country's adoption of a seclusion policy, an indigenous style characteristic of the Yamato race made the fullest possible development in all branches of art.

Kamakura Period Between the Emperor Gotoba and Emperor Godaigo the Kamakura Shogunate assumed the reins of government. The Kamakura period (1192–1337) of political history is at the same time that of Japanese art. During those 140 years traditional Japanese sentiments and thought developed vigorously against the aristocratic culture which had gained influence in the

Digitized by Google

previous period. Such a turn of cultural development could not but react on art; the anti-traditional spirit of the age began to tell on artistic creation. Not only from within but also from without the country a radical change was introduced, because in those days the Yuan period succeeded the Sung in China; and its highly favoured cultural attainments came flooding into Japan. The two movements, of foreign and domestic origin, combined to lay a foundation for modern fine art which started and developed in and after the Muromachi period.

(1) Painting. Continued civil wars, military administration, and war literature, all contributed to the voluminous production of yemakimono (picture-scrolls) based on themes from battle scenes. Another kind of yémakimono worthy of special mention was painted for the purpose of propagating the doctrines of newly risen sects of Buddhism, such as the Zen and Jodo. This pictorial demonstration of religious doctrines proved quite effective; for, by depicting the life and work of founders, a more direct appeal was made to prospective converts. For the same reason the yémakimono came to serve also as a means to propagate knowledge of the origin and development of shrines. Quite a number of picture-scrolls of the period still remain in perfect condition, those reckoned among the greater works being the History of the Kitano Tenjin Shrine, Murasaki-shikibu-nikki, Sanjurokkasen, Mokoshurai-ékotoba, Honen-shonin-gyojo-édzu. The last mentioned is a yémakimono depicting the personal history of Honen-shonin, the noted priest who founded the Jodo sect of Buddhism. Among scores of yémakimono painters, Nobuzané Fujiwara, Kéion Sumiyoshi, En-i, Takakané Takashina and Yoshimitsu Tosa were the most popular. A further noteworthy event of the period was the rise of portrait painting. Generally speaking, until this period there was no other method for reproducing figures except by sculpture. The term for portrait was niséyé. But toward the end of this period a new mode appeared. The technique of portrait painting made rapid advance from the time of Takanobu Fujiwara, Taira-no-Shigémori, Minamoto-no-Yoritomo whose works are treasured at the Shingoji temple, all rare masterpieces.

With reference to Buddhistic painting, the aforementioned Takuma school gradually improved in technique; and with the appearance of Shoga, a descendant of the Takumas, the Takuma school of Buddhist painting was founded, drawing a clear line between the old and the new delineations.

(2) Sculpture. The Kamakura period was also a fecund age in the direction of sculpture. Compared with the work of the preceding period it appeals with more virility. The Shichijo-bussho, the most important sculptors' association or guild, which had been making steady progress, produced a group of consummate artists in Koéi, Unkéi, Jokaku, Kaikéi, Tankéi, Jokéi, Koben and Kosho, all contemporaries. Among them the most skilled were Unkéi, Tankéi and Kaikéi, who are recognized as the best sculptors since the time of Jocho. Whereas Unkéi and Tankéi excelled in producing the expression of passion, as in statues of nio (Deva kings), Kaikéi specialized in gentle, elegant figures, like those from the chisel of Jocho.

(3) Industrial Art. Lacquer-ware technique, too, made a remarkable advance. The art of engraving also progressed, especially with the appearance of the Kamakura-bori (Kamakura style of engraving). Technique in metal work, also saw much development, inheriting the characteristic virtues of the Fujiwara period. Up to that time the native ceramic art was in so primitive a stage that only unglazed ware could be manufactured. After Kato Shirozaémon-Kagéhisa returned from Sung, marked progress was made in this field, and fine chinaware became a home product.

(4) Architecture. The mansions of nobles had been built in the Shinden-zukuri style, but during the Kamakura period the Buké-zukuri style of architecture started and soon dominated. This is a simple, plain style with an unusual number of sliding-doors to let in light. Though this style of structure has gone out long ago, one can get an idea of it through various yémakimono in which this style of architecture is represented. After the advent of the Zen sect of Buddhism under Éisai-zenshi from China, then called Sung, and the establishment of the Kenninji temple at Kyoto, Zen style of architecture came to attract attention. A good example of this style, still intact, is the Enkakuji temple at Kamakura.

Muromachi Period Succeeding the Kamakura age came the Muromachi period (1337–1573), which, after the two centuries and a half of civil strife, ended with the downfall of the Ashikaga Shogunate. In China the civil disturbances of the late Yuan dynasty had been brought under control by the rise

Digitized by Google

of the Mings, resulting in the advent of the golden age of Ming culture, which exercised some influence on Japan.

(1) Painting. As was customary whenever Chinese culture attained its zenith, communication between the two countries, which had been on the wane, revived again, resulting in the gradual decline of yémakimono, portrait and Buddhist painting, handed down from the preceding Kamakura period, which were unable to cope with the powerful influence of Sung-Yuan style of painting in China. Early in this period there were not a few yémakimono worthy of note such as the Gosannen-gunki by Koréhisa Fujiwara and the Yuzu-nembutsu-engi, joint work of Hiroyuki Tosa, Yukihidé Kasuga, Mitsukuni Fujiwara, Ryuko Awataguchi, Jakusai Rokkaku and Éishun Hogan. The latter still remains in the form of a coloured wood-engraving, perhaps the most widely known as our oldest example of this art.

Typical portrait work of the period is that of the Emperor Godaigo in the Daitokuji temple, Kyoto, and of Yoshimochi Ashikaga, at the Shingoji temple. Far more characteristic of the age, however, are the portraits of Zen priests or so-called "Chinso." The most typical chinso is, perhaps, the portrait of Séiichi-kokushi, painted by Mincho, preserved in the Tofukuji temple. Strictly speaking, chinso has more similarity to the Sung-Yuan style than to the Tosa school of portraits.

Buddhist painting of the Muromachi period may roughly be adjudged stationary. Copying of old works seemed to have been the only task attracting artists, among whom a priest named Myotaku-zenshi was known for skill in painting Acala pieces; the principal works of this priest-painter are treasures of the Imperial Art Museum. The most distinguished pictorial artist throughout the period, however, was Mincho. Among his works handed down to the present are the portrait of Séiichi-kokushi, above-mentioned, Gohyakurakan (five hundred disciples of Buddha) in the Tofukuji temple, and Daiséhanzu, known as the largest painting in the country. In his brush work are ample traces of the style of the Sung-Yuan period in China; and he was, moreover, the leading painter of the age by whose art the Continental technique, introduced with the Zen sect in the Kamakura period, was digested, assimilated and consummated.

Special mention should be made of the advent of the Sung-Ming style in yamatoyé work, enhancing the traditional style of that art. This new movement was no doubt made possible by the Ashikaga policy of encouraging trade with China, then called Ming. In consequence, numerous Chinese works of art continued to be imported, greatly stimulating the domestic art world. Among various merits and demerits then inherited from the Continent, kakémono (hanging pictures) and a more advanced technique in painting flowers and birds were perhaps the most outstanding. It is also a fact worthy of special mention that the Sung-Yuan style of sumiyé painting (black and white) became popular throughout Japan, under artists like Jasoku Soga, Sotan Oguri, Shinno Nakano, Sésshu and Masanobu Kano. These five sumiyé painters were talented pupils of Shubun who enjoyed the confidence of the Shogun and occupied an important position under the Shogunate government as a painter.

(2) Sculpture. Images of Buddha continued to be supplied by the Shichijobussho of which mention has already been made. But these products gradually lost their artistic value. The aforementioned Shubun was also a good sculptor. It is said of his skill that the great wooden statue, 40 feet high, of Amitabha, enshrined in the Unkyoji temple, was originally the work of a Nara sculptor, but was retouched by Shubun's chisel and improved.

(3) Industrial Art. In this epoch the development shown in industrial art was mainly due to the whimsical enthusiasm of the Shogun. Chanoyu (tea ceremony), a ceremonial etiquette genuinely Japanese, gave rapid rise to various branches of industrial art especially in fine porcelain, the climax of which was reached during the latter part of the period. This progress was not only in works of manual art like tea-cups, trays and so on, but in kakémono and tokonoma (alcove) furnishings of the tea-room, and the building itself, all of which are required for the full ceremony of tea-serving. Most of the tea-cups used for chanoyu in those days were of Chinese make, or imports from the South Seas.

(4) Architecture. The Zen style of architecture greatly improved. This, combined with the cult of chanoyu lent impetus to the construction of simple but tasteful habitations and temples, with gardens and arbours harmonious to the main building, well represented by the Kinkakuji and Ginkakuji temples in Kyoto.

Momoyama Period The 25 years from 1574 to 1598 is termed the Momoyama

Digitized by Google

period. During this comparatively short interval civil disturbances stirred up the whole country under the governments of Nobunaga Oda and Hidéyoshi Toyotomi, acting as military dictators.

(1) Painting. Eitoku Kano was perhaps the greatest painter of the period. Nearly all the mural pictures in the castles of Azuchi and Osaka and the mansion at Shuraku are attributed to the brush of this famous artist. The peculiarity of the painting of the period lies in its grand scale and gorgeous, bright colouring. This is especially true of Eitoku Kano's work. Another noted landscape and ukiyoyé painter was Sanraku Kano; in the Sesshu school of sumiyé were Kogan Unkoku and Tohaku Haségawa; the Tosa school had Mitsuyoshi who succeeded to the Tosa school which had by that time been reduced to a school only in name.

(2) Sculpture. The most striking feature of the Momoyama sculpture is its clever adaptation to decoration of architecture. Besides Hidari-Jingoro, whose fame as an accomplished sculptor and engraver still enjoys nation-wide popularity, there were skilled artists like Yuzaémon Miyanishi and Matayémon Okabé. As in the Muromachi period, the art carving "No" masks came into vogue.

(3) Industrial Art. Metal work experienced remarkable improvement. The sword-guard artists evolved novel designs. Also in the technique of bronze casting no insignificant progress was made by casters like Yashichiro Nagoya, Dojin Nishimura, Yojiro Tsujido, Yayémon Nagoya and Échizen-no-Shojosansho. The current of the age could not but influence the art of raised lacquer, handed down from previous periods; now works on large scale, fit for the decorative purposes architecture, began to dominate the situation. The Kannon-do of Chikubu-shima inland, Biwa lake, and the Kodaiji temple of Kyoto best represent the technique of this period.

Ceramics also were greatly enhanced in technique. Impelled by the nation-wide use of chinaware, due to the popularization of chanoyu, imported articles grew insufficient. As a natural consequence, home industry in this direction was greatly stimulated, resulting in Nagasuké Chojiro invention of the rakuyaki style and Rokubéi Mikazuki's bizenyaki style of ceramic ware. In the realm of textile art, what is to be noted is that in the Tensho Era (1573) a new technique in weaving was introduced from Ming, China, and reached Nishijin, Kyoto, where it appeared in the form of Yamato-nishiki, ito-nishiki, karaori-nishiki, kinran (gold brocade), donsu (satin damask), rinzu, and so on.

In conclusion it may be said of the art of the Momoyama period that, while developing such gorgeous and imposing structures as the Jurakudai and Momoyama Castle, it popularized the exclusive, austere and polite art of chanoyu. Thus two diametrically opposed arts developed all through the Momoyama period.

Yédo Period The Yédo period (1603–1867) started with the Tokugawa Shogunate in Tokyo, then called Yédo, and terminated with the downfall of that government just before the Meiji Restoration. During the 260 years of the Tokugawa Shogunate Yédo flourished, cultivating its own culture as against that of Kyoto, giving the country two centres of culture, one in the east and one in the west.

In the early Yédo period communication with countries beyond the sea opened and foreign trade was thereby greatly stimulated. Whereas hitherto Japan had had little or no dealing with Europeans, save Spaniards and Portuguese, Japan now began to be visited by Hollanders and Britons who came to her shores for commercial purposes. Relations with neighbouring countries also increased in intimacy, due to improved communication facilities. Nevertheless, the people were not satisfied with official passivity but extended their trade with Siam, Cochin, Tonking, Luzon. Furthermore, Iyéyasu Tokugawa, the first Shogun of that line, even attempted to trade with Spain and Mexico, sending envoys for that purpose. By this improved intercourse with foreign countries traditional Japanese art was greatly influenced. In the Kan-éi Era (1644), Émosaku Yamada first produced pictures in Western style painting. Fortunately or unfortunately, however, the third Shogun, Iyémitsu, with a view to stamping out Roman Catholicism pursued and imposed an isolation policy by prohibiting the entrance of all foreigners except Hollanders and Chinese. Under this high-handed policy the infiltration of foreign influence was almost completely checked, and domestic genius again came into its own, developing another golden age of fine art.

(1) Painting. The Kanos, who had flourished since the Muromachi period, produced skilled artists like Yasunobu, Naonobu, Tsunénobu and Morinobu, all of whom had the honour of serving the Shogunate as official painters. But this special favour proved a cause of decline in the Kano school later. Among the

Digitized by Google

of the Mings, resulting in the advent of the golden age of Ming culture, which exercised some influence on Japan.

(1) Painting. As was customary whenever Chinese culture attained its zenith, communication between the two countries, which had been on the wane, revived again, resulting in the gradual decline of yémakimono, portrait and Buddhist painting, handed down from the preceding Kamakura period, which were unable to cope with the powerful influence of Sung-Yuan style of painting in China. Early in this period there were not a few yémakimono worthy of note such as the Gosannen-gunki by Koréhisa Fujiwara and the Yuzu-nembutsu-engi, joint work of Hiroyuki Tosa, Yukihidé Kasuga, Mitsukuni Fujiwara, Ryuko Awataguchi, Jakusai Rokkaku and Éishun Hogan. The latter still remains in the form of a coloured wood-engraving, perhaps the most widely known as our oldest example of this art.

Typical portrait work of the period is that of the Emperor Godaigo in the Daitokuji temple, Kyoto, and of Yoshimochi Ashikaga, at the Shingoji temple. Far more characteristic of the age, however, are the portraits of Zen priests or so-called "Chinso." The most typical chinso is, perhaps, the portrait of Séiichi-kokushi, painted by Mincho, preserved in the Tofukuji temple. Strictly speaking, chinso has more similarity to the Sung-Yuan style than to the Tosa school of portraits.

Buddhist painting of the Muromachi period may roughly be adjudged stationary. Copying of old works seemed to have been the only task attracting artists, among whom a priest named Myotaku-zenshi was known for skill in painting Acala pieces; the principal works of this priest-painter are treasures of the Imperial Art Museum. The most distinguished pictorial artist throughout the period, however, was Mincho. Among his works handed down to the present are the portrait of Séiichi-kokushi, above-mentioned, Gohyakurakan (five hundred disciples of Buddha) in the Tofukuji temple, and Dainéhanzu, known as the largest painting in the country. In his brush work are ample traces of the style of the Sung-Yuan period in China; and he was, moreover, the leading painter of the age by whose art the Continental technique, introduced with the Zen sect in the Kamakura period, was digested, assimilated and consummated.

Special mention should be made of the advent of the Sung-Ming style in yamatoyé work, enhancing the traditional style of that art. This new movement was no doubt made possible by the Ashikaga policy of encouraging trade with China, then called Ming. In consequence, numerous Chinese works of art continued to be imported, greatly stimulating the domestic art world. Among various merits and demerits then inherited from the Continent, kakémono (hanging pictures) and a more advanced technique in painting flowers and birds were perhaps the most outstanding. It is also a fact worthy of special mention that the Sung-Yuan style of sumiyé painting (black and white) became popular throughout Japan, under artists like Jasoku Soga, Sotan Oguri, Shinno Nakano, Sésshu and Masanobu Kano. These five sumiyé painters were talented pupils of Shubun who enjoyed the confidence of the Shogun and occupied an important position under the Shogunate government as a painter.

(2) Sculpture. Images of Buddha continued to be supplied by the Shichijobussho of which mention has already been made. But these products gradually lost their artistic value. The aforementioned Shubun was also a good sculptor. It is said of his skill that the great wooden statue, 40 feet high, of Amitabha, enshrined in the Unkyoji temple, was originally the work of a Nara sculptor, but was retouched by Shubun's chisel and improved.

(3) Industrial Art. In this epoch the development shown in industrial art was mainly due to the whimsical enthusiasm of the Shogun. Chanoyu (tea ceremony), a ceremonial etiquette genuinely Japanese, gave rapid rise to various branches of industrial art especially in fine porcelain, the climax of which was reached during the latter part of the period. This progress was not only in works of manual art like tea-cups, trays and so on, but in kakémono and tokonoma (alcove) furnishings of the tea-room, and the building itself, all of which are required for the full ceremony of tea-serving. Most of the tea-cups used for chanoyu in those days were of Chinese make, or imports from the South Seas.

(4) Architecture. The Zen style of architecture greatly improved. This, combined with the cult of chanoyu lent impetus to the construction of simple but tasteful habitations and temples, with gardens and arbours harmonious to the main building, well represented by the Kinkakuji and Ginkakuji temples in Kyoto.

Momoyama Period The 25 years from 1574 to 1598 is termed the Momoyama

Digitized by Google

period. During this comparatively short interval civil disturbances stirred up the whole country under the governments of Nobunaga Oda and Hidéyoshi Toyotomi, acting as military dictators.

(1) Painting. Eitoku Kano was perhaps the greatest painter of the period. Nearly all the mural pictures in the castles of Azuchi and Osaka and the mansion at Shuraku are attributed to the brush of this famous artist. The peculiarity of the painting of the period lies in its grand scale and gorgeous, bright colouring. This is especially true of Eitoku Kano's work. Another noted landscape and ukiyoyé painter was Sanraku Kano; in the Sesshu school of sumiyé were Kogan Unkoku and Tohaku Haségawa; the Tosa school had Mitsuyoshi who succeeded to the Tosa school which had by that time been reduced to a school only in name.

(2) Sculpture. The most striking feature of the Momoyama sculpture is its clever adaptation to decoration of architecture. Besides Hidari-Jingoro, whose fame as an accomplished sculptor and engraver still enjoys nation-wide popularity, there were skilled artists like Yuzaémon Miyanishi and Matayémon Okabé. As in the Muromachi period, the art carving "No" masks came into vogue.

(3) Industrial Art. Metal work experienced remarkable improvement. The sword-guard artists evolved novel designs. Also in the technique of bronze casting no insignificant progress was made by casters like Yashichiro Nagoya, Dojin Nishimura, Yojiro Tsujido, Yayémon Nagoya and Échizen-no-Shojosansho. The current of the age could not but influence the art of raised lacquer, handed down from previous periods; now works on large scale, fit for the decorative purposes architecture, began to dominate the situation. The Kannon-do of Chikubu-shima inland, Biwa lake, and the Kodaiji temple of Kyoto best represent the technique of this period.

Ceramics also were greatly enhanced in technique. Impelled by the nation-wide use of chinaware, due to the popularization of chanoyu, imported articles grew insufficient. As a natural consequence, home industry in this direction was greatly stimulated, resulting in Nagasuké Chojiro invention of the rakuyaki style and Rokubéi Mikazuki's bizenyaki style of ceramic ware. In the realm of textile art, what is to be noted is that in the Tensho Era (1573) a new technique in weaving was introduced from Ming, China, and reached Nishijin, Kyoto, where it appeared in the form of Yamato-nishiki, ito-nishiki, karaori-nishiki, kinran (gold brocade), donsu (satin damask), rinzu, and so on.

In conclusion it may be said of the art of the Momoyama period that, while developing such gorgeous and imposing structures as the Jurakudai and Momoyama Castle, it popularized the exclusive, austere and polite art of chanoyu. Thus two diametrically opposed arts developed all through the Momoyama period.

Yédo Period The Yédo period (1603–1867) started with the Tokugawa Shogunate in Tokyo, then called Yédo, and terminated with the downfall of that government just before the Meiji Restoration. During the 260 years of the Tokugawa Shogunate Yédo flourished, cultivating its own culture as against that of Kyoto, giving the country two centres of culture, one in the east and one in the west.

In the early Yédo period communication with countries beyond the sea opened and foreign trade was thereby greatly stimulated. Whereas hitherto Japan had had little or no dealing with Europeans, save Spaniards and Portuguese, Japan now began to be visited by Hollanders and Britons who came to her shores for commercial purposes. Relations with neighbouring countries also increased in intimacy, due to improved communication facilities. Nevertheless, the people were not satisfied with official passivity but extended their trade with Siam, Cochin, Tonking, Luzon. Furthermore, Iyéyasu Tokugawa, the first Shogun of that line, even attempted to trade with Spain and Mexico, sending envoys for that purpose. By this improved intercourse with foreign countries traditional Japanese art was greatly influenced. In the Kan-éi Era (1644), Émosaku Yamada first produced pictures in Western style painting. Fortunately or unfortunately, however, the third Shogun, Iyémitsu, with a view to stamping out Roman Catholicism pursued and imposed an isolation policy by prohibiting the entrance of all foreigners except Hollanders and Chinese. Under this high-handed policy the infiltration of foreign influence was almost completely checked, and domestic genius again came into its own, developing another golden age of fine art.

(1) Painting. The Kanos, who had flourished since the Muromachi period, produced skilled artists like Yasunobu, Naonobu, Tsunénobu and Morinobu, all of whom had the honour of serving the Shogunate as official painters. But this special favour proved a cause of decline in the Kano school later. Among the

Digitized by Google

these leaders displayed great activity in nurturing the Japanese style of painting as we see it today.

(3) Western Painting. Towards the end of the Yédo Era the foundation of the Occidental style in painting had already been laid by Kokan Shiba and Denzen Aodo; and now came Togai Kawakami, Yuichi Takahashi, Horyu Goséda, Hosui Yamamoto, Shinkuro Kunisawa, Chu Asai, Shotaro Oyama, Kiyowo Kawamura and Naojiro Harada, for whom the former foundation work became the basis for a new start. In the early Meiji days, English and Italian painters came to give lessons at the fine art department of the Tokyo Imperial University. Later, in the 21st year of Meiji, the Meiji Bijutsukai was founded for the purpose of enhancing the Western style of painting. It was, however, not until Kiyotéru Kuroda returned from France and opened a department for Western style painting in the Tokyo Academy of Fine Arts, that the Occidental mode really became established. Important artists in the new style in those days were Saburosuké Okada, Éisaku Wada, Takéji Fujishima, Kotaro Nagahara, Mankichi Kobayashi, Fusétsu Nakamura, Kunishiro Mitsutani, Sanzo Wada and Kunzo Minami. The models set by these great painters still prevail to-day, but will in future be more subjected to the influence of the Japanese style before reaching consummation, just as the Japanese style will assimilate Western motives and technique as it keeps on its forward march.

(4) Industrial Art. The ceramic industry made rapid advancement after the arrival of Wagner from Germany with a new technique; and with the help of Kozan Miyagawa, Yohéi Kiyokazé, Dohachi Takahashi, Rokubéi Shimizu and Sobéi Kinkozan. In recent years Hazan Itaya, Rokubéi Shimizu and Ichiga Numata have won distinction in this sphere of art. During the Meiji Era, fine cloisonne was manufactured and exported in abundance. Metal work also developed to a remarkable extent, producing a number of skilled artists. In the domain of lacquer and dying industries no less improvement brought Japanese industrial art to the verge of its golden age.

The tendency of Western countries to vie with one another in holding Japanese art exhibitions amply endorses the international value of Japanese art.

(5) Sculpture. Upon opening the Tokyo Academy of Fine Arts, Kyuichi Takéuchi and Koun Takamura gave lessons in traditional Japanese wood sculpture. Western style sculpture was also taught, by an Italian instructor in the academy, side by side with lessons from Shukéi Naganuma who had returned from Italy, followed by Fumio Asakura, Taimu Tatéhata, Séibo Kitamura. From Koun Takamura and Kyuichi Takéuchi we come down to Choun Yamasaki, Unkai Yonéhara, Denchu Hirakushi, Shin Naito. In the Meiji Era the rise of ivory carving was also conspicuous, producing engravers like Gyokuzan Asahi and Komyo Ishikawa.

What helped the phenomenal ascendency of all branches of art were the Bunten (Education Office's art exhibition) which later came to be called Téiten (Téikoku Bijutsuin art exhibition), and the Inten (Nihon Bijutsuin art exhibition). Besides, there were and are exhibitions held by many other smaller groups of painters. From the viewpoint of art, it is not too much to say that Japan is to the Orient what France is to Europe.

Conditions of World of Fine Arts During 1938–39

The condition of fine arts during 1938 reflected most sensitively the effect which the amplification of the China Incident produced upon the society and thought of the people. The effect of the wartime conditions upon fine arts began to be conspicuous during the first half of 1938, the most outstanding feature of which may be described as a positive tendency among the artists toward what may be called "L'art dont l'idée est inspirée par la guerre," or "L'art dont les motifs sont directement inspirés par la gurre."

Toward the latter part of 1937, and after, numerous artists were permitted to visit North China and Shanghai to observe the conditions of the military operations there. The result of their observations of the battle-front was the production of various sketches which were soon sent home and featured both newspapers and magazines in Japan Proper. Later, the artists who returned home from the front displayed their works at art exhibitions though on a small scale.

At the beginning, however, most of the artists who visited China were of lesser fame and their activities were not systematic. By and by, leading artists volunteered to visit the battle-front in increasing numbers, and the authorities of the defence services not only welcomed their visit but even undertook to select representative artists and assigned each of them to a specific piece of work. Thus, with the pro-

Digitized by Google

gress of military operations the authorities of the fighting services commenced to show a positive interest in the artistic recording of the war scenes. The result was that the standard of the work improved and works of great artistic value depicting life at the front were produced, and aroused much interest among artists' circles.

That the fighting services showed keen interest in the production of war pictures was well evidenced when the Hata unit of the Imperial forces operating in Central China invited the representatives of the various artists' groups to visit the Shanghai-Nanking area in April, 1938, when the operations for the capture of Nanking were successfully completed. Those invited included Messrs Kenichi Nakamura, Ryohei Koiso, Kanemon Asai, Junkichi Mukai, Jumpei Eto, Kakutaro Kashiwabara, Kazu Wakita and Masayoshi Minami, all of whom produced paintings of great value depicting the principal battles fought in the Shanghai-Nanking area. This fact attracted a great deal of public attention, not only because it manifested the interest of the authorities of the Navy and the Army for the recording of war scenes by the brush of the artists but also because the project was sponsored in an orderly and systematic way and the selection of the artists was wide and representative.

In March, 1938, the eighth exhibition under the auspices of the Independent Art Association which represents the progressive group of artists of the Western School in this country was held as the first event of the season. Among the exhibits those which aroused special interest among the public were the two paintings of Nobuyuki Shimizu, one entitled "Vestiges of War in the Kiangnan Area" and the other entitled "Camouflage," which were done in modern style based on cubism and represented the first pieces of work of a purely artistic design to be exhibited at a salon of war pictures.

All this served to increase the general interest in war pictures in this country and an increasing number of pictures were painted with war themes and secured a place in various art exhibitions.

In September, 1938, the Nikakai, a representative "opposition" salon of European pictures in this country, held its 25th exhibition at the Tokyo Prefectural Art Gallery. At the exhibition, a special room was devoted to the display of paintings with war themes relating to the China Incident or scenes of social life connected with it. It may be said that the work entitled "A Chasing Fight in Hsuchow" by Shin Kurihara, the work entitled "Farewell to the Island" by Tsuguji Fujita, and the work entitled "War Nurses in the Field" by Konosuke Tamura were among the representative exhibits at the salon.

Following the exhibition of the Nikakai, the Art Exhibition of the Education Department was held from October 15th to November 20th. Among the representative exhibits at the government exhibition were the work entitled the "Defence of the Fen River" by Usaburo Ihara and the work entitled the "Surviving Special Service Corps" by Kanemon Asai.

While works of art relating to war themes continued to be produced, the question arose among artists as to whether the modern mechanized warfare could become an objective of purely artistic work when viewed from the standpoint of technique. This question was discussed in earnest among Japanese-style artists whose works had been exclusively of a classical nature. Although they were not prepared to yield their artistic standards, their strong patriotism enabled them gradually to overcome their traditional prejudice against modern objectives by the adoption of the principle, "L'art dont l'idée est inspirée par guerre" in the broad sense of the expression.

The new tendency implied no change in artistic standards other than that of an approach to a kind of theme art or tendency art, and the artists manifested their own traditional spirit in the selection of motifs. It is also interesting to note here that while the war scenes were treated by artists of Western school from a chiefly realistic standpoint, artists of the Japanese school laid stress upon the enhancement of the racial consciousness and the promotion of the spiritual aspect of war. As the best illustrations of this latter kind may be mentioned the works of Taikan Yokoyama and Gyokudo Kawai which were shown in the Japanese section of the Art Exhibition of the Education Department in the latter part of 1938.

The above two outstanding artists of the Japanese school indicated by their work the course to be followed by the members of their school. The work of Taikan Yokoyama depicting in Indian ink the solemn precincts of the Ise Grand Shrines which are sacred to the Sun Goddess expressed in powerful outline the symbol of national polity and the spirit of the race. The above two outstanding artists of the Japanese school indicated by their work the course to be followed by the members of their school. The work of Taikan Yokoyama depicting in Indian ink the solemn precincts of the Ise Grand Shrines which are sacred to the Sun Goddess expressed in powerful outline the symbol of national polity and the spirit of the race. Expressive of another

Digitized by Google

aspect of national life is Gyokudo Kawai's work entitled "Shade of a Tree," depicting an old farmer with a calf by his side resting in the shade of a tree in an upland pasture. This picture silently bespoke confidence which the Japanese people put in their country and the gratitude which they felt while defending the home front in the brightened atmosphere of continued victory. The former pictured the stern, immutable bulwark of national spirit in the shape of the grand shrines while the other showed the true national sentiment of the Japanese people as lovers of peace, and their equanimity in a restless world.

The afore-mentioned two works not only showed the prevailing spirit of the times but also indicated the two phases of the national life, the idealistic and the realistic aspects of the nation. Among the exhibits belonging to the category of Taikan Yokoyama's works at the same exhibition were Yukihiko Yasuda's "Sun Tze," a picture based on the Chinese story of Sun Tze, a great tactician, who killed the favourite consort of the king for her disturbance of the military command and Nampu Katayama's "After the Rain" which showed its moral in the current situation by depicting the snow-white flowers of bottle-gourds sending out sweet fragrance in the dust after a shower. The principal exhibits of the category of Gyokudo Kawai's works included Keigetsu Kikuchi's "Exchange of Courtesies in the Camp" which shows two warriors rejoicing over their meeting in the field in the old samurai manner, Shinsui Ito's "Cow and Boy" which depicts the active life of the rising generation defending the home-front and Suiun Komuro's "Military Dog" which brings to mind the valuable service rendered by dogs on the battle-front.

In the "Cow and Boy" Shinsui Ito displayed a vigorous realism departing from his usual sentimental touch and preference for sensuous, feminine subjects. For this reason his latest work won him a new reputation.

Thus, in the field of Japanese-style paintings, the current situation inspired the artists toward a new approach to their subject and indicated their deep interest in the prevailing conditions. Thus were brought into play the traditional symbolism and idealism of the Japanese art.

European-style paintings by Japanese artists concretely reflected the current situation in the selection of motifs. The contrast to the symbolical Japanese-style pictures is illustrative of the social role played by European-style works by Japanese artists, showing the raison d'être of this school which has progressed on the basis of realism and impressionistic naturalism.

Another feature associated with the current situation as seen in the selection of motifs is the general interest displayed by artists in China and its people. Japanese artists had throughout history shown an enthusiastic admiration for China's civilization and art just as the European artists had done for the fine arts of Italy. So deep was the admiration for Chinese standards of beauty that Japanese artists always sought the motifs for their important works in China. This custom changed radically, however, when the anti-Japanese policy of the National Government of China made it impossible and even dangerous for Japanese artists to travel in the country.

Under the above circumstances, the number of Japanese artists travelling in China decreased with the result that Japanese artists began to lose touch with Chinese art and life. The China Incident, however, unexpectedly gratified the desire of many of the artists to come in personal contact with Chinese art and life and enabled them to renew their interest in regard to them. This could not fail to affect their selection of motifs for their works.

The 24th exhibition under the auspices of the Japan Academy of Art, one of the most influential organizations of artists, was held from September 3rd to October 4th when Seison Maeda, a leading artist connected with the said exhibition, displayed his latest elaborate work entitled "Picture of the Stone Image of Buddha in Tatung" which he produced during his visit in China. The work was favourably received. A work of identical motif by the leading artist of Seiryusha School, Ryushi Kawabata was exhibited at the 10th exhibition of the Seiryusha, an organization of artists which stands for modern influences in art and opposed to the Japan Academy of Art. Considerable interest was aroused by the contrast between the two, the former being based on romanticism while the latter was based on realism. Incidentally, it may be mentioned that the stone image of Buddha in Tatung also formed the motif for a few other works displayed at the academy's exhibition.

The same tendency also characterized the works of artists of the Western-school whose works were displayed at

Digitized by Google

the exhibition held under the auspices of the Nikakai and the Art Exhibition of the Education Department, and at other exhibitions. Many of the works displayed at the Education Department's exhibition were produced with Chinese motifs. Among the outstanding exhibits at this exhibition were Hiromitsu Nakasawa's "Wantzelou in Peking," and Riichiro Kawashima's "Chiulungpi in Peking." The most notable among the exhibits at the Issuikai exhibition were Hakutei Ishii's "Tranquillity in Mongolia" and Ikuma Arishima's "Spring in the Kiangnan Area."

It may be inferred from the foregoing paragraphs that the Japanese artists of the Western school have maintained a realistic standard while those of the Japanese school have shown preference to classicism. This is, of course, a very generalized statement, for there are so many factions in each school, showing different tendencies and following different standards. It is noteworthy that in most cases the progressive elements are represented by the young artists. In this connection, special mention must be made of the fact that the progressive elements of the Western school have been laying stress on romanticism as against the rather drab realism while those of the Japanese school have been emphasizing realism as against the old idealism or romanticism.

The most active among the organizations of the progressive elements of the Japanese school and the Western school are the Seiryusha and the Independent Fine Arts Association respectively. Other organizations of the kind include the "New School Artists' Association" (Shin-seisakuha Kyokai) which was organized by the younger artists who withdrew from the Art Exhibition of the Education Department, the stronghold of academism, in 1936, to uphold anti-academism.

For a time, the movement of the progressive elements seemed to become unduly reactionary, deviating from its primary object and often showing a leaning toward fanaticism. They were time and again absorbed in ideological arguments in disregard to accepted standards and social sentiment, thus seeming to stand opposed to actualities. The extraordinary situation brought about by the outbreak and progress of the China Incident, however, provided a chance for the progressive elements to reconsider their attitude with the result that the reactionary tendency gradually came to be restrained and an approach to social sentiment instead of a deviation from actualities was manifested, while their interest in technique increased.

As already stated, Nobuyuki Shimizu, a leader of the progressive group, displayed his works including the "Vestiges of War in the Kiangnan Area" at the 8th exhibition of the Independent Fine Arts Association, which testified to the fact that patriotism also prevailed in the vanguard of artists. Thus, the patriotic sentiment expressed itself most vigorously in the choice and treatment of subjects. Although this sentiment had always been present among the artists, the China Incident gave an opportunity for its full display.

An approach to realistic portrayal of sentiment was clearly manifested in the series of pictures entitled "Three Pieces on Clouds" which was displayed at the 8th exhibition of the Independent Fine Arts Association by Ichiro Fukuzawa, representative leader of the super-realism movement in this country.

The Independent Fine Arts Association is an organization which is primarily interested in the advancement of Western standards of art based on modernism. The organization, however, has been featured by liberalism permitting full development of originality of the individual members with the result that some members have already experimented in the blending of Japanese and Western technique. Zenzaburo Kodama and Kinosuké Ebihara have done much in this regard. The former seems to have been aiming at a modern type of ukiyoé (genre-pictures) of Hokusai and Hiroshigé while the latter appears to have been endeavouring to present Japanese sentiment in the refined technique of modern French art.

The various works of Tsuguji Fujita were displayed at the exhibition of the Nikakai and Ryuzaburo Umehara's "Femme nue aux éventails" and Takeji Fujishima's "The Tillage" were displayed at the Art Exhibition of the Education Department. Particularly, the work of Fujishima attracted attention for its Oriental-style presentation of the spirit of the times and the impressionistic attitude of the painter.

Next, we shall deal with the conditions of sculpture during the year. Generally speaking, the current situation arising from the China Incident was also reflected in sculpture as in painting. The number of works by sculptors representing soldiers, sailors, and other military subjects showed a re-

Digitized by Google

Japanese aesthetic sense. The interior is composed of 25 galleries, in addition to a number of storing rooms, repair rooms, research rooms, etc. The total floor space amounts to 6,522 tsubo. Its equipment as a museum built with the most modern technique is perfect both for affording the best possible observation of the objects of art on display and for preserving them, there being adequate illuminating facilities, and equipment for keeping the temperature at a proper degree, appropriate ventilating facilities, etc.

The new building of the Imperial Museum comprises the best and largest galleries of objects of the fine art of ancient times in this country. The inauguration of the new galleries, emerging as they did under wartime conditions attracted a great deal of public attention.

Another event which requires special mention here concerns the repair works undertaken on the famous Horyuji. As is well known, the Horyuji is a temple comprising some of the oldest wooden structures now existing in the world and has some of the best objects of ancient fine art in Japan including paintings and sculptures.

The repair works have been undertaken on parts of the buildings of the temple on an elaborate scale and the situation brought about by the outbreak of the China Incident has not hindered the continuance of the work which began in 1936. In this connection, it must be noted that the execution of the repair work has not only contributed to the preservation of the time-honoured temple but has also incidentally furnished various materials for clearing many a tangled or doubtful historical problem.

Those parts of the temple on which repair works were completed during 1938 included the gallery (kairo) (dating back to the Muromachi period) of the eastern temple (tōin) and the southern and the front gates.

As the repair work progresses, the question as to how the famous mural painting representing Bodhisattva on the inside wall of the golden hall of the western temple should be handled will have to be solved. Careful investigations are now being made by experts from engineering, artistic and scientific points of view.

After the outbreak of the China Incident, exchanges of objects of fine art to be exhibited abroad or shipment out of the country of works of fine art for the purpose of promoting international goodwill and friendship were discontinued for a time. In 1938, however, the German Government expressed a desire to have various ancient Japanese art products put on display at the proposed exhibition of works of ancient Japanese fine art to be held in the following spring by the State Art Museum in Berlin. Accordingly in December of the same year, numerous works of fine art (mostly those belonging to the period between the thirteenth and eighteenth century) including paintings, sculptures and industrial products were shipped to Germany.

In this connection, it must be observed that many of the outstanding works of ancient fine art of Japan have since time immemorial been preserved by individual families and seldom taken out of the homes of their owners. For this reason, it has always been a difficult task to secure valuable works of art for exhibition abroad. Thus, the shipment of so many valuable art products to Germany in 1938 must be regarded as a highly significant achievement.

The above mentioned events are all illustrative of the cultural efforts and activities which the Japanese people have been displaying under the wartime system.

During 1939 With the beginning of 1939, the various wartime conditions influencing fine art circles, as witnessed in the previous year, became more conspicuous. With the progress of the China Incident, it became evident that the fine art circles developed a specific tendency.

The decisive victory of the Japanese forces in China and the far-reaching military operations which gradually expanded during the past one year or more threw a new light upon the significance of the China Incident. The new military and political conditions inevitably directed the course of national thought and turned all sorts of cultural activities toward a constructive ideology. In other words, the defensive attitude of the Japanese Government against the hostile activities of the Chinese Kuomintang Government, which marked the beginning of the China Incident, was changed to a positive and constructive attitude of establishing a new order in East Asia as a result of the developments which had occurred during the period of nearly two years followng the outbreak of the incident.

The national policy for the establishment of a new order in East Asia thus

Digitized by Google

official organ, however, is no longer the same. The problem is a new one to be solved in the light of the importance of the social role which the official organ must play under the wartime system in connection with the China Incident. It may be said that the problem as it stands today is far more important than any in the past.

The reforms of the Art Exhibition of the Education Department failed to prevent the appearance of a division among artists into more than two groups. The Government authorities, however, have been endeavouring to unite these groups together and their earnest efforts in this connection were apparent in the 2nd exhibition held during 1938. This exhibition marked, it must be noticed here, a change in the significance of the endeavours because the strengthening of the Art Exhibition of the Education Department as a government-managed enterprise under the wartime system was the aim which served to alleviate the opposition between the "government" and the "opposition" artists, both groups realizing the need for minimizing internal friction in order to facilitate the accomplishment of the objective of the war.

In connection with the second reformed Art Exhibition of the Education Department, mention must also be made of the fact that the exhibits were characterized by the limitation of size which was effected in line with the policy for economization of the consumption of commodities. This limitation affected to a large extent the "government" artists, particularly the younger, ambitious artists, who used to advocate the production of largesize exhibits. The noisy exhibits such as had often been seen previously thus disappeared in the 1938 exhibition but a dull monotony was felt because there was no sufficient variety possible within the limited size of exhibits.

To sum up, the artists circles were more active during 1938 than ever before. It is true that the number of exhibits at the various public exhibitions showed a decrease by from 10 to 20 per cent since the outbreak of the China Incident but the decrease is to be attributed to the fact that many artists who used to send out exhibits were summoned to the colours. Although the number of exhibits decreased, the number of visitors to the exhibition halls increased by from 20 to 50 per cent and the number of exhibits sold out during 1938 was also larger than that for the preceding years.

The increase in the number of persons visiting exhibitions in spite of the decrease in the number of exhibits indicates that the popular interest in fine arts has increased and that the mission of artists has increased in importance in its relation to the social life of the people under the wartime system. The success attending upon exhibitions was not limited to large-scale exhibitions alone but also featured small-scale private exhibitions.

The improvement in quality of private exhibitions has become quite remarkable of late as a result of the increased popular interest in fine arts and the increased consciousness of the artists concerned of the value of such exhibitions as an important means of displaying their works before the public. Among the principal private exhibitions which were held during 1938 were the 1st exhibition of the Shugenkai formed by Saburo Miyamoto, Konosuké Tamura and Shin Kurihara, exhibitions of the works of Ryuzaburo Umehara, Zenzaburo Kodama, Takeji Fujishima, held seperately, the third exhibition of the works of Kenzo Okada, the 6th exhibition of the works of Kinosuke Ebihara, the exhibition of the Japanese-style pictures by Ryushi Kawabata and the 4th exhibition of pictures in Indian ink by Koichiro Kondo.

Next, we shall examine a few facts concerning classical fine art.

The month of November, 1938, witnessed the completion of the interior furnishings of the new building of the Imperial Museum in Ueno Park. The construction works on the building had been completed toward the end of 1937 after six years of strenuous efforts. Upon completion of the interior fittings, the new museum building was opened with a grand exhibition specially arranged to mark the occasion.

The Imperial Museum has for its aim the exhibition of classical art productions. It is divided into eight departments including the archaeological department, textile department, lacquer department, ceramics department, metal works department, sculpture department, book department and picture department. Representative objects of Oriental arts from ancient times to the Edo period are contained therein.

The new museum building is a ferro-concrete structure, 360 shaku wide by 240 shaku long and 100 shaku high. It is built in the modern Oriental style of architecture and in conformity with

Digitized by Google

Japanese aesthetic sense. The interior is composed of 25 galleries, in addition to a number of storing rooms, repair rooms, research rooms, etc. The total floor space amounts to 6,522 tsubo. Its equipment as a museum built with the most modern technique is perfect both for affording the best possible observation of the objects of art on display and for preserving them, there being adequate illuminating facilities, and equipment for keeping the temperature at a proper degree, appropriate ventilating facilities, etc.

The new building of the Imperial Museum comprises the best and largest galleries of objects of the fine art of ancient times in this country. The inauguration of the new galleries, emerging as they did under wartime conditions attracted a great deal of public attention.

Another event which requires special mention here concerns the repair works undertaken on the famous Horyuji. As is well known, the Horyuji is a temple comprising some of the oldest wooden structures now existing in the world and has some of the best objects of ancient fine art in Japan including paintings and sculptures.

The repair works have been undertaken on parts of the buildings of the temple on an elaborate scale and the situation brought about by the outbreak of the China Incident has not hindered the continuance of the work which began in 1936. In this connection, it must be noted that the execution of the repair work has not only contributed to the preservation of the time-honoured temple but has also incidentally furnished various materials for clearing many a tangled or doubtful historical problem.

Those parts of the temple on which repair works were completed during 1938 included the gallery (kairo) (dating back to the Muromachi period) of the eastern temple (tōin) and the southern and the front gates.

As the repair work progresses, the question as to how the famous mural painting representing Bodhisattva on the inside wall of the golden hall of the western temple should be handled will have to be solved. Careful investigations are now being made by experts from engineering, artistic and scientific points of view.

After the outbreak of the China Incident, exchanges of objects of fine art to be exhibited abroad or shipment out of the country of works of fine art for the purpose of promoting international goodwill and friendship were discontinued for a time. In 1938, however, the German Government expressed a desire to have various ancient Japanese art products put on display at the proposed exhibition of works of ancient Japanese fine art to be held in the following spring by the State Art Museum in Berlin. Accordingly in December of the same year, numerous works of fine art (mostly those belonging to the period between the thirteenth and eighteenth century) including paintings, sculptures and industrial products were shipped to Germany.

In this connection, it must be observed that many of the outstanding works of ancient fine art of Japan have since time immemorial been preserved by individual families and seldom taken out of the homes of their owners. For this reason, it has always been a difficult task to secure valuable works of art for exhibition abroad. Thus, the shipment of so many valuable art products to Germany in 1938 must be regarded as a highly significant achievement.

The above mentioned events are all illustrative of the cultural efforts and activities which the Japanese people have been displaying under the wartime system.

During 1939 With the beginning of 1939, the various wartime conditions influencing fine art circles, as witnessed in the previous year, became more conspicuous. With the progress of the China Incident, it became evident that the fine art circles developed a specific tendency.

Music

The First Period

Primitive Music The development of Japanese music may be divided into four periods. The first period originates in prehistoric times and ends about the reign of the Empress Suiko (592–629 A.D.). This is the music of the ancient Japanese (Yamato), and is here named, for convenience, primitive music. To regard the music of this stage as primitive may seem inappropriate, because towards the close of the 6th century Yamato civilization had advanced quite beyond primitive culture. The word primitive is applied here because, although music should show some development of artistic form, no such form was known in the music of this period.

The Second Period

Introduction of Foreign Music The second period started about the end of the Suiko régime in the 7th century, and continued till about the end of the Heian period, at the close of the 12th century. The characteristic feature of this period lies in the building up of Japanese music upon a foundation of Chinese, Korean and Indian music, which possessed a markedly advanced form and was then being freely introduced into Japan.

(1) The First Half. In the first half of this period imported music was imitated. Music was first introduced from Korea (Chosen), then from India and lastly from China. Of the three, only that from China continued to come freely thereafter. The Chosen music then imported was widely different from the music introduced from China and India, especially in the degree of its evolution. But even such undeveloped music as that of Chosen (then called Sankan), was far more advanced than Japanese music. It is, therefore, but natural that there was a great gulf of difference between the standard of the Japanese music of the early period and that later imported from China and India. Moreover the early models were monopolized by the nobles; the masses could not share the privilege of enjoying the advanced art but had to be content with the same old primitive music. For two to three hundred years this state of things continued, until the reigns of Emperors Saga and Nimmyo when genuine Japanese Court music, called gagaku, came into vogue. But even this gagaku was of foreign origin too.

(2) The Second Half. During the second half of the second period, foreign and domestic music became harmonized, producing a new Japanese style in vocal music. Founded on the imported music staff, the vocal music of this period cannot be compared with the purely national music that prevailed in a later period. The varieties then developed were kagura, saibara, roéi and imayo, all of which can be included in the following two groups:

(a) One group was modelled after foreign music but set to the key of Japanese music of the primitive age; and hence the reconstruction thus effected in ancient Japanese music was only in form. The most conspicuous examples are the kagura, Azuma-asobi, Kumé-uta and Yamato-uta. No doubt the kagura existed in the prehistoric age, as may be inferred from Japanese history, but not until past the middle of the Héian period did it appear in the regular form of music. The kagura is a sacred dance with music, practised on the stage of a shrine at village festivals. The kagura now observed, however, is fundamentally different from that staged in those days; it saw marked development in the Héian period. In the early days of the sacred Kagura dance it adopted so primitive a form of vulgar indecency that it could not be performed today.

During this latter part of the second period all the other three branches of music, namely, Azuma-asobi, Kumé-uta and Yamato-uta, were also practised at shrine festivals. Originally they had no relation with shrines, the first two having developed from folk-songs, and the third from a war-song sung during the triumphant expedition into Yamato under the Emperor Jimmu. The adoption of those folk-songs in the rites of sacred festivals was made possible by the advanced music of foreign origin employed at Buddhist temples; better music also became indispensable at Shinto shrines in order to rival the advanced Buddhist music. Unlike Buddhist temples, the Shinto shrines hesitated to make use of the imported variety; and so they had no alternative in those days but to improve their music on the ancient models

Digitized by Google

in order to meet the requirements of the times, establishing the guiding principle for monumental art and newly creating a fresco department and a monumental sculpture department. Particularly noteworthy is the fact that the said university led in the creation of a guiding organ for the researches in the production of mural paintings in this country.

Lastly, mention must be made of the conditions of the architectural and photographic circles in the country. With reference to the architectural circles, it must be noted that ever since the outbreak of the China Incident, the consumption of building materials has been subjected to a wartime control but, nevertheless, considerably large structures have been constructed one after another. Especially, great activity has been evident in connection with building plans in connection with the erection of various memorial structures for the China Incident, construction of modern cities in the areas under Japanese occupation, and memorial enterprises for the celebration of the 2600th anniversary of the founding of the Japanese Empire in 1940.

During recent years, there has been in evidence an increasingly intensified opposition between two groups in the architectural circles, one group advocating rationalistic modern style from the progressive point of view and the other favouring a return to the traditional style from the standpoint of classicism. The tendency of the former group is reflected in the Dai-ichi Sogo Building, the Communications Hospital and the Central Radio City while the new building of the Imperial Museum and the Manchoukuo Club represent the tendency of the latter group, all these buildings having been completed during or after 1938.

A review of the conditions of the photographic circles shows that prior to the outbreak of the China Incident, the efforts to secure a place for photography as a modern art had been limited to a few amateurs. The occurrence of the China Incident, however, incidentally brought about a situation favourable for the intensification and spread of such efforts and a considerable progress in technique has been achieved in this field.

Of late, wall pictures and informative pictures have begun to acquire a position of considerable importance, representing a new field for photographers' activities. In respect to the photographic mural pictures, mention must be made of the manufacture of such pictures for the decoration of the Japanese pavilion in the World Exposition held in New York and in the San Francisco Exposition during the spring of 1939.

As regards informative pictures, it must be noticed that as a result of the importance attached to their utilization by journals and other publications, informative pictures have been gradually freeing themselves from subordination to news stories and descriptive articles and acquiring the status of an independent art.

Art Museums

A list of the more important art museums follows :

1. Tokyo Imperial Household Museum: Uéno Park, Tokyo; open daily from 9 a.m. to 4 p.m.
   Departments: Art and History.
   Officials. President: Éisaburo Sugi; Manager: Nagamitsu Asano
2. Imperial Household Museum at Nara: In Nara Park; open daily from 9 a.m. to 4 p.m.: closed from Dec. 25 to Jan. 5.
   Departments: History and Art. Director: Ki Yamaguchi
3. Kyoto Onshi Museum: In Shichijo, Kyoto; open daily from 9 a.m. to 4 p.m.; closed from Dec. 25 to Jan. 5. Departments: Art and History.
4. Chokokan: In Uji Yamada, Mié.
5. Réihokan: At Koya-san, Wakayama.
6. Treasure house, Kanshin-ji: In Kanshin-ji-mura, Minami-Kawachi-gun, Osaka.
7. Treasure house, Koryuji: At Uzumasa-mura, Kadono-gun, Kyoto.
8. Réihokan, Ninnaji: At Omoro, Kadono-gun, Kyoto.
9. Museum of the Faculty of Letters, Imperial University, in Kyoto.
10. Kankokan: in Hiroshima.
11. Treasure house of the Itsukushima shrine: At Miyajima, Hiroshima.
12. Kokuhokan: at Kamakura.
13. Sanda Museum: at Sanda, Arima-gun, Hyogo.
14. Governmental Museum: at Seoul, Chosen.
15. Kéishu Museum: in Kéishu-gun, Kéisho-hokudo, Chosen.
16. Prince Li's Museum: in Seoul, Chosen.
17. Kanto-cho Museum: at Port Arthur, Kwantung Leased Territory.

music now in vogue had its origin in this period.

The Muromachi Era The Muromachi Era, sandwiched in between the Kamakura and Tokugawa eras, corresponds to a middle third period in the history of music. Between the Kamakura and Muromachi Shogunates a striking difference is noticeable in that, while a military administration was possible under the former, it was denied to the latter. Beginning with the Muromachi Era the Ashikagas removed the Shogunate from Kamakura to Kyoto. Since Kyoto was the seat of the Imperial household, the officials who were military men could not do without etiquette in their association with Court officials of the Imperial household. They had to be familiar with the art of flower arrangement, the tea ceremony and the yokyoku music of the lyrical drama, or Noh dance. Thus from the necessity of studying these arts of social etiquette, military men had to approve and promote them. The introducers of the sarugaku dance were priests who returned from China, and used this sort of drama for moral or religious purposes, like the miracle and morality plays in England. The Noh dance was probably derived from primitive forms of sarugaku and other musical dances.

Early Yédo Era The last period begins and ends in the early Yédo Era. All through this period popular music prevailed; the samisen, a popular musical instrument introduced into the country at the end of the Ashikaga Era, rose to great influence. Naturally, therefore, such popular music as the joruri, nagauta, kouta and hauta developed rapidly; they were especially popular among merchants and artisans.

The samisen was not only a representative musical instrument throughout the Yédo Era but also occupies a most important position in Japanese music today. This three-stringed Japanese guitar has now come to enjoy worldwide recognition as an advanced musical instrument. Nearly 400 years ago, toward the end of the Muromachi period, it arrived in the country through the Ryukyu islands and is supposed to be of Spanish or Chinese origin. Compared with the sho and biwa, imported in the 5th or 6th century, the samisen is a thing of but yesterday. Yet it is found everywhere in Japan as an accompaniment to vocal music.

The Fourth Period

Internationalization of Japanese Music The fourth period covers the Meiji and Taisho eras (1868–1926) when domestic music rose to join the world current of music. The people awoke from their long slumber throughout the isolated Yédo Era, and exchanged anti-foreignism for free intercourse with the outside world. With this epochal open-door movement came the Meiji Restoration which eliminated the Shogunate and restored the old Imperial régime. In obedience to the august wish of the Emperor Meiji all welcomed the introduction of the supposedly more advanced European civilization. Music was no exception. European music then imported was enthusiastically imitated all through the period. Production of imitative art was not the only task assigned to that age, for side by side with the movement the reconstruction of native music occupied the serious attention of musicians. A similar tendency is noticeable in and about the Nara period in the 8th century, when advanced ideas, imported from the continent, afforded models on which the ancient music of the country was reconstructed. Yet, a great difference is evident between that and the movement now under review; because, whereas in that day home music still lingered in the primitive stage and imitation of alien models was effected only with extreme difficulty, improvement in the native music of the Meiji Era was so easy a matter that reconstruction could be carried out by mere importation of new staves. This fourth period, which corresponds to the Meiji and Taisho eras, can be studied from three points of view, with reference to the development of the art.

(1) Innovations in Traditional Music and Revival of Ancient Music. In the Yédo period the development of music in form was insignificant, because importance was placed on expression of sentiment. People who realized this defect in the traditional Japanese music, agreed on the necessity of introducing radical innovations in this direction. This new movement was responsible for the stimulus given by the extensive introduction of European music, which in form was far superior to Japanese. Up to about the 16th year of Meiji considerable effort was expended towards eliminating this defect. As a practical attempt to attain this object, a movement was created for reconstruction work on the form of sho music which had deplorably degenerated in the Yédo Era, due to the influence of samisen music then at the height of popularity. The rise of the Yamada school in Tokyo is an example. Shakuhachi music likewise could not escape

Digitized by Google

being influenced by the reconstruction current of the times.

For revival of ancient Japanese music the Gagaku Bureau was created in the Imperial Household Office in the 3rd year of Meiji. A large number of authorities on gagaku became officials of the bureau and strove to effect reorganization of the ancient music of Japanese parentage. These Court musicians set about composing new music out of gagaku, for use in elementary schools. The national anthem, Kimigayo, is a product of that bureau. Precisely speaking, Kimigayo ought to be played in gagaku, but, instead, it has come to be rendered with European instruments; for in those days they were the only musical instruments in educational institutions. Kibigaku, which is still popular in the Kansai district, is a form of gagaku somewhat vulgarized, at the time, by Hoshu Kishimoto, an Okayama musician.

(2) Diffusion of European Music. One of the outstanding features of musical development in the Meiji and Taisho eras is that Japanese musical education was placed on the foundation of European music. The introduction of European music into Japan can be traced as far back as the entrance into Japan of Christianity. This, however, had been monopolized by the introducers themselves in their respective localities of influence, until in the 2nd year of Meiji it entered the capital for the first time. In this year Japanese soldiers learned military band music from an English naval band master at Yokohama, which is perhaps the first instance of our official use of European music. Soon afterwards, in the 5th year of Meiji, both army and navy bands were inaugurated. Later, in the 12th year of Meiji, an investigation commission on school musical education was established in the Education Office. A commission, headed by Mr. Shuji Izawa, conducted inquiries as to the best method of teaching European music in Japanese schools. In the following year, the Education Department invited an expert from America, and, under his superintendence, made music a part of elementary school education. Three years after, the Tokyo Academy of Music was established. This is but a brief outline of the growth of European music in Japan during the Meiji Era. It was mainly due to Government encouragement that European music was popularized in Japan much earlier than generally expected. But, for sounder and more thorough instruction in European music we must look to the era of Taisho. Rapid progress of music in the Taisho Era was made possible principally in the following ways:

(a) Propagation by Gramophone. This invention enabled inhabitants of even the remotest corners of the island Empire to appreciate the great foreign music masters.

(b) European War and Visiting Musicians. At the outbreak of the European War many well-known musicians of the West went to America and Oriental countries in order to avoid being involved in the turmoil, and to find appreciation of their music in more peaceful environment. These world-famous musicians gave a number of concerts in Japan, and thus afforded us an opportunity to hear the best music the world can produce. So fortunate an event contributed much toward cultivating a taste for music in this country. Not long afterwards came radio, also from the West; and, like the gramophone, radio also greatly helped the public towards a more intelligent appreciation of European music. Radio, however, should be regarded as more properly belonging to the present era of Showa.

(3) Internationalization of Japanese Music. The diffusion of the knowledge of European music demonstrated to us its international qualities, systematized form and aesthetic structure. The vast difference between this international music of the West and Japanese music which is but national, served to spur on the reconstruction movement among the Japanese interested in music. The movement originally started in the middle of the Meiji Era, but at that time it had no fixed goal at which to aim. Now, however, renewed ambition moved in three definite directions:

(a) The attempt to harmonize European instruments with the rhythm of Japanese music was laudable, but this seems to have been confined only too largely to Japanese students of European music.

(b) The movement to produce European rhythm with Japanese musical instruments, such as the samisen, sho and shakuhachi, was the task of those musicians who specialized in domestic music and who were yet familiar with modern ideas.

(c) A scheme to create a grand symphony orchestra of mixed foreign and domestic instruments was studied and tried by a few accomplished musicians, but the success or failure of the attempt is a question of the future.

(3) Internationalization of Japanese Music. The diffusion of the knowledge of European music demonstrated to us its international qualities, systematized form and aesthetic structure. The vast difference between this international music of the West and Japanese music which is but national, served to spur on the reconstruction movement among the Japanese interested in music. The movement originally started in the middle of the Meiji Era, but at that time it had no fixed goal at which to aim. Now, however, renewed ambition moved in three definite directions:

(a) The attempt to harmonize European instruments with the rhythm of Japanese music was laudable, but this seems to have been confined only too largely to Japanese students of European music.

(b) The movement to produce European rhythm with Japanese musical instruments, such as the samisen, sho and shakuhachi, was the task of those musicians who specialized in domestic music and who were yet familiar with modern ideas.

(c) A scheme to create a grand symphony orchestra of mixed foreign and domestic instruments was studied and tried by a few accomplished musicians, but the success or failure of the attempt is a question of the future.

Digitized by Google

of the kind in the world. The numbers played by the band included a piece of "nagauta" music entitled "kanjincho," a piece of "koto" music entitled "Rokudan" and a piece of "tokiwazu" music entitled "Kodakara" which won greater applause than the various numbers of Western music played by the band. The military band, too, showed great progress under the direction of Kenshi Nagai. There is no doubt the meritorious services thus rendered by Nagai will be remembered by posterity. The farewell party given in honour of Nagai upon his retirement from the service as the director of the military band was an unusually splendid one. Thereafter he continued his services for the growth of the military and naval bands, composing marches and directing outdoor concerts.

The organizations of the military and naval bands at the present time may be summarized as follows:

The military band is maintained at the Toyama Army School and is therefore called the band of the Toyama Army School. At present, it has a staff of about 100 musicians and a standard division of the band is composed of 50 musicians which may be divided into two sub-divisions of 25 musicians each, this being the minimum unit. In addition, about 20 new recruits are admitted every year for training as student musicians.

The naval band is composed of a total of some 430 musicians who are separately attached to the naval stations and squadrons. Conforming to the number of naval stations and squadrons, the naval band is divided into 8 units with about 50 musicians in each unit. In addition, about 60 new recruits are taken in every year to be trained for a period of one year and five months before being attached to the various units.

Tokyo Music School In the 12th Year of Meiji (1879), the Ministry of Education created a Musical Enquiry Commission with a view to (1) producing new compositions by blending the Eastern and the Western music; (2) promoting the national music by creating facilities for its instruction; and (3) creating a music course in the various schools. Shuji Izawa, the then principal of the Tokyo Higher Normal School, was appointed chairman of the enquiry commission.

In the following year, Luther Whiteing Mason who then held an important position in the musical educational circles in the United States was employed as musical instructor. Mason, a rare musical educator, devoted himself earnestly to solidify the foundation of the musical education in this country by his systematic method of instruction, and thus made himself a great benefactor to the cause of musical advancement in the country. In the same year, 20 students were assembled and systematic training in music was instituted. Simultaneously, a large number of pianos, organs and stringed musical instruments were provided.

The endeavours of the Musical Enquiry Commission bore their first fruit in the 15th Year of Meiji (1882) in the form of a concert participated in by the students who had been trained under Mason. Mason returned to his homeland in July of the same year and one year later, Franz Eckert was employed as the director of the military band who gave lessons chiefly in orchestration, scoring and harmony.

The compilation of song books for use in primary schools was one of the primary tasks of the Musical Enquiry Commission. The work of the body progressed steadily with the result that three collections of songs were compiled and authorized as text-books for primary schools.

In October of the 20th Year of Meiji (1887), the Musical Research Institute (Ongaku Torishirabe-dokoro) was renamed the Tokyo School of Music. The first governmental school of music was thus brought into being and Shuji Izawa became its principal. For four consecutive years, Izawa devoted himself to the perfection of the equipment and improvement of the facilities of the school. He also wrote and published a book entitled Musical Education and the meritorious services which he rendered in bringing up the music school will remain on record permanently.

In November of the 21st Year of Meiji (1888), Rudolf Dietrich from Austria was appointed instructor at the Tokyo School of Music. Dietrich was a brilliant man, having graduated with honours from the conservatoire in Vienna. He was skilled in playing the piano, organ and violin. Furthermore, he was an affable man of character and as such was best fitted to assist in the bringing up of the music school which had been in existence only for a short time.

Among the graduates of the Musical Research Institute (precursor of the Tokyo School of Music) there were many who became distinguished musicians. In this connection, special men-

Digitized by Google

of the fact that this national anthem was later revised to such an extent as to leave little resemblance to the original. The student musicians learned how to play the newly-composed "Kimi-ga-yo" and a number of English airs. The "Ishin" march (march of the Meiji Restoration), which is frequently played even now, is one of the English-style compositions of those days.

In the 4th Year of Meiji (1871), the military bands of the three clans of Satsuma, Choshu and Tosa were merged into an Imperial military band upon the creation of the Ministry of Military Affairs. The Imperial military band was also placed under the direction of Fenton.

In the meanwhile, the Christian devotional music which had been introduced by the missionaries had gradually been gaining ground in the country. During the early part of the Meiji period, the various Christian sections undertook to prepare Japanese versions of hymns and various publications of the kind appeared. This also made a great contribution toward the development of Western music in this country.

Meiji-Taisho-Period

Military Band The 4th year of Meiji (1871) witnessed the amalgamation of the military bands of the Satsuma, Choshu and Tosa clans into an Imperial military band. Later, the Imperial military band was divided into two sections, namely, the military band and the naval band. The former changed from the English to the French style and a French bandmaster, D'achron, was appointed its director. D'achron continued in this post for nearly 10 years.

In the spring of the 12th Year of Meiji (1879), the naval band invited Franz Eckert to assume the post vacated by D'achron. Besides being the band director, Eckert held the post of instructor at the Musical Research Institute (Ongaku Torishirabe-dokoro) which had been recently established where he taught musical theories. Through his enthusiastic instruction, Eckert contributed so much to the musical advancement in this country that he is now regarded as the father of German music in this country. Eckert is particularly remembered by posterity because of his successful harmonization of the "Kimi-ga-yo" which is now the authorized national anthem. Eckert is also remembered for his famous compositions of the "Kimi-ga-yo march" and the "Kanashimi-no-kiwami" (funeral march) specially composed for the funeral services of the Empress Dowager Yeisho (1897). The "Kanashimi-no-kiwami" was also played at the time of the funeral services for the Emperor Meiji and the Emperor Taisho and is still preserved as a most treasured piece of music in the Imperial Household.

Under Eckert's able direction the naval band achieved rapid strides and gave concerts at various places. Indeed, it may not be too much to say that Eckert is the greatest among the naval band directors the country has ever known. When Eckert was relieved of the duty, Gustav Albe, a German musician, was employed as the music instructor.

The military band had the privilege of being trained under the direction of D'achron until the 16th Year of Meiji (1883) when he resigned. Charles Leleu who was a distinguished director of military band in France in those days was appointed his successor. Maintaining that the success of the military music lies in personality, Leleu carried out a grand-scale renovation of the personnel of the military band and effected various other alterations, thus causing the military band to take on a new aspect. After remaining in office for four years, however, Leleu had to return to France under instructions from his home government. Leaving the future affairs of the military band to Yoshitoyo Shimoto, Leleu went home, with many in this country feeling deep regret at his departure. Later, Eckert, the director of the naval band, was appointed to assume the concurrent post of director of the military band which thus added German technique of military music to its French technique and further consolidated its foundation.

During the Sino-Japanese and Russo-Japanese wars, both the military and naval bands experienced a period of remarkable activity, both on the battle-fronts and behind the guns. During the two wars, numerous military songs were composed, not a few of which are popular even to this day.

The Taisho period may be considered as the most important period for the development of military music in this country. Special mention in this connection must be made of the fact that the naval band, also including strings, visited England to attend the Royal Coronation and its excellent performance under the direction of Tokichi Setoguchi on the occasion gained great favour among the public there and was even praised as one of the first-rate bands

Digitized by Google

of the kind in the world. The numbers played by the band included a piece of "nagauta" music entitled "kanjincho," a piece of "koto" music entitled "Rokudan" and a piece of "tokiwazu" music entitled "Kodakara" which won greater applause than the various numbers of Western music played by the band. The military band, too, showed great progress under the direction of Kenshi Nagai. There is no doubt the meritorious services thus rendered by Nagai will be remembered by posterity. The farewell party given in honour of Nagai upon his retirement from the service as the director of the military band was an unusually splendid one. Thereafter he continued his services for the growth of the military and naval bands, composing marches and directing outdoor concerts.

the early part of the Taisho era, Rossi, instructor in the Western musical department of the Imperial Theatre promoted Rossi's Opera Comic which staged a number of comic operas by Offenbach, with Nobuko Hara, Kintaro Shimizu and Rikizo Taya and aroused much public interest.

In December of the 9th Year of Taisho (1920), Kosaku Yamada presented at the Imperial Theatre Debussy's "L'enfant Prodigue" and Wagner's "Tannhauser," which was a unique event of its kind in the history of opera activities in this country because it constituted the first artistic and able presentation of an elaborate and difficult theme.

Plectrum Music The introduction of plectrum instruments into this country dates from the sixteenth century but the instruments of those days differ largely from the instruments of today. The mandoline music as it is played today was introduced into this country by Kempachi Hiruma who learned to play the instrument during his stay in Berlin in connection with commercial business. When he returned home, he caused the first mandoline orchestra of the country to be formed in the Ueno Art School. Mandoline music came to be liked especially by university students and mandoline clubs were formed in the Keio and Doshisha Universities. Morishige Takei organized the Orchestra Sinfonica Takei in the 4th Year of Taisho (1915) and ever since has endeavoured to facilitate the spread and development of the artistic plectrum music.

Orchestral Music The orchestra movement also progressed with the Tokyo School of Music taking the lead. August Junker, who was an instructor at the music school, made devoted efforts in directing symphony orchestras and thus came to be known as the father of orchestral music in this country. When he arrived in Japan to assume the post of instructor at the Tokyo School of Music in the 30th Year of Meiji (1897), the conditions of the musical circles here were such that it was well-nigh impossible for him to put his ideas into operation. The fact that symphonies were first played here by the members of the faculty of the Tokyo School of Music and its students under the direction of Junker will alone suffice to make his name immortal in the musical world of the country. About the same time, the naval band created a stringed-instrument department for orchestral music, thus aiding in the development of military music. The naval band including stringed instruments was dispatched to England and the United States where their musical skill and technique won much appreciation.

With the progress of Western music in the country the musical section of the Imperial Household Department also created a place for Western music. Under the direction of Eckert, the section gave orchestral concerts frequently. It need not be said that the joint concerts given by the Tokyo School of Music, the military band and the naval band as well as the musical section of the Imperial Household Department were the most brilliant affairs in the musical world of the country during the latter part of the Meiji period.

Recent Times

Tokyo School of Music The Tokyo School of Music held a position of the highest authority in all branches of Western music in this country during the Meiji period and in the early part of the Taisho period. Its monopolistic position, however, came to be gradually encroached upon by various private musical organizations actively engaging themselves in an earnest study of Western music as a result of the remarkable development achieved by Western music from the middle of the Taisho period. The position of the Tokyo School of Music has not been affected by this fact and it has continued to operate as the only governmental music school and has sent out many able musicians who have been trained under its excellent instructors.

Some years ago, the orchestra of the Tokyo School of Music made remarkable progress under the enthusiastic direction of Professor C. Pringsheim and rendered a number of difficult compositions. Particularly, the orchestra made a great contribution to the musical circles of this country by giving the first performances of Mahler's Symphony No. 5 in 1932, Beethoven's Symphony No. 9 in 1933 and Bach's "Mathaus—Passion" in 1937. Professor Pringsheim was relieved of his duties at the Music School upon the expiration of his term in 1937 and in the autumn of the same year, Professor Hans Schwieger of Germany was employed in his place. When Professor Schwieger departed for the United States in March, 1938, arrangements were made for the employment of Professor Helmut Fermer from Germany who arrived to take up the post in April of the same year.

department of the Tokyo School of Music where he served as instructor for some time returned home in the spring of 1937 upon the expiration of his term. As his successor, Leonid Kreutzer who had been living in this country for some years past was invited to become instructor at the Music School. Maria Toll, vocal instructor, also returned home upon the expiration of her term in the spring of the same year to be succeeded in the post by Ria von Hessert from Germany.

Orchestral Music Following the lead by the Tokyo School of Music, the military and naval bands and the musical section of the Imperial Household Department in organizing orchestras, private circles in the country also launched a movement for the promotion of orchestral music after the middle of the Taisho period. At first, however, the movement failed to gain much ground on account of the lack of a systematic organization. During the latter part of the Taisho period, Kosaku Yamada for the first time introduced to the public orchestral music really worthy of the name by holding concerts jointly with the Russian orchestra from Harbin. This served as a great incentive to the promotion of a movement for symphonic orchestral music with the result that Kosaku Yamada and Viscount Hidemaro Konoé established the Japan Symphonic Music Association which created the first purely professional orchestra in the country.

The New Symphony Orchestra. Under the impetus of the activities of the Japan Symphonic Music Association, a few symphony orchestras were brought into being but they failed to achieve any great result. Later, the Japan Symphonic Music Association was split into two bodies with Viscount Konoé leading the greater part of the members of the association in organizing the New Symphony Orchestra. The association continued to function with Kosaku Yamada as its director. Ever since, the New Symphony Orchestra has been active as the leading orchestra in the country, giving 12 regular concerts every year. In 1936, Viscount Hidemaro Konoé quitted the New Symphony Orchestra for financial reasons and the body invited Joseph Rosenstock from Germany to become its conductor.

Under the direction of Rosenstock, the New Symphony Orchestra made great strides during the 1936-37 and 1937-38 seasons by performing numerous difficult compositions. Particularly, the body won the admiration of the lovers of music, young students of music and composers of this country by rendering for the first time the modern musical works of various nations during the 1937-38 season. The same members of the New Symphony Orchestra also form the Japan Broadcasting Association's Symphony Orchestra which has been broadcasting orchestral music through the JOAK. The conductors of the broadcast orchestral music include Rosenstock, Masao Shinohara, Hideo Saito, Terunobu Banzai and Kojiro Kobune.

In addition, there are various orchestras in the country including the orchestra of the musical section of the Imperial Household Department, the Central Symphony Orchestra (under the direction of Yazaemon Hayakawa), the Concert Populair (under the direction of Tadashi Hattori), etc. The various music schools also have their orchestras composed of instructors and students. Among the local orchestras, mention must be made of the Takarazuka Symphonic Musical Association and the Osaka Broadcasting Association's Symphony Orchestra which is composed chiefly of the musicians of the Takarazuka body and is under the direction of Emmanuel Metter. Unlike the New Symphony Orchestra, however, these organizations have been giving no regular concerts.

Brass-band Music The best brass-bands in the country are the military band and the naval band which give public concerts, by turns, at the Hibiya Park's Band Stand from spring to autumn every year. The brass-band music has of late spread among the civilian circles with rapidity and small-scale brass-bands have been organized by middle schools, young men's associations and boy scouts. The development of the military music has become all the more pronounced under the influence of the China Incident which broke out in 1937 and brass-bands have become the most popular musical organizations. The local bodies including cities, towns and villages have long been maintaining their own brass-bands as a means of entertaining their inhabitants by giving outdoor concerts.

Since 1936, the organizers of the Musical Week have been sponsoring an annual brass-band concour. In 1938, a wind-instrument concour was held simultaneously, and all this gave a stimulus to the spread of the brass-band music.

Chamber Music Chamber music has been in a most neglected condition in this country. As principal chamber musical organizations in the land, the

Digitized by Google

Jupiter Quartet (established in 1920) and the Suzuki Quartet (created in 1925) are to be mentioned. The two bodies have been giving a number of concerts every year.

Chorus Choruses are organized all over the country. Not only the various music schools but the various universities, colleges and secondary schools have their choruses. Choruses are also maintained by other civilian organizations and in Tokyo alone, the number of choruses reaches the neighbourhood of 50, all of which are under the direction of well-known musicians and are active in giving concerts and broadcasting recitations.

The most notable among the numerous choruses are the Orion Choir, the Tokyo Lieder Tafel Phelaine, the Vocal Four Chorus, the Mixed Chorus of the Tamagawa Gakuen, the Euphonic Chorus and the Brahms Choir. The Dai-Nippon Federated Chorus, which includes among its members some of the leading singers of the above choruses, as well as the Dai-Nippon Chorus which was formed in 1937, have been attracting considerable public attention on account of their large-scale organizations and the proficiency of their members.

Instrumental Music The piano is the most popular musical instrument in this country. In former times, every Japanese family with moderate means possessed a koto or samisen for the musical education of its daughters as the ability to play one of these instruments was considered an important feminine accomplishment. With the progress of Western music in the country, however, the piano came to be adopted in place of the koto and the samisen. Indeed, the number of Japanese maidens receiving instruction in piano has increased so rapidly that it may be regarded as an unmistakable sign of the advance of the Japanese nation in the field of musical culture in recent years.

Consequently, the number of accomplished pianists in the country is considerable. In this connection, special mention must be made of Chieko Hara who won the first place in the Conservatoire de Paris in 1932 at the age of 17 and Miwako Kai who achieved excellent results at the international musical concour in Vienna. Other notable pianists include Professor Kisei Iguchi of the Tokyo School of Music, Sonoko Inoue and Noboru Toyozo who returned from Vienna in 1938. Among the resident foreign pianists in the country are the world-famous Leonid Kreutzer, Leo Sirota, Maxim Schapiro and Paul Scholtz, who have been rendering inestimable service to the musical circles here by giving lessons and recitals.

Next to the piano, the violin is the most popular musical instrument in Japan and has also made its way into a great number of Japanese homes whose children are receiving musical training. The oldest violinist in the country is Sachiko Ando who studied under the noted Joseph Joachim and who has already retired from the first line of service. Kenshu Wanibuchi and Takeo Inoue are still active. Among the foreign violinists, Professor Alexander Moguirewsky of the Tokyo School of Music and Willy Frey have been contributing much in the field of violin music in the country. As yet no Japanese musicians have distinguished themselves as players of the violoncello. Mention might be made in this connection that Prof. Duckson, who is an instructor at the Tokyo School of Music, is contributing his share in training the young students by his ardent instruction at the school and by giving public concerts of the Piano Trio together with Leo Sirota and Moguirewsky.

Vocal Music It is in the field of vocal music that the Japanese musicians first appeared on the first-rate stage of the world. As early as in the beginning of the Taisho period, Tamaki Miura distinguished herself as a vocalist and has since enjoyed great public favour as singer in the role of "Madam Butterfly" by appearing before the footlights of first-rate theatres in the capitals of the world. Returning home a few years ago, she again created an opera troupe bearing her name and is continuing her efforts for the musical education of the rising generation and for the promotion of the opera movement in the country. Next, mention must be made of Toshiko Sekiya and Yoshie Fujiwara, both of whom also appeared in the first-rate theatres in Europe and America as opera singers of world-fame.

Principal among other vocalists who are most active at present are Ayako Ohta (soprano), Miho Nagato (soprano), Taneko Seki (soprano), Kaneko Yanagi (contralto), Tamotsu Kinoshita (tenor), Keikichi Yadabe (bass), Takeo Ito (baritone), and others. Ria von Hessert who assumed the post of instructor at the Tokyo School of Music in 1938 has since been giving instruction in vocal music together with Wucherpfennig and Netke Loewe, also of the To-

Digitized by Google

The programme included Bach's Concerto Italiano, Schumann's Carnival and Chopin's Ballades, Etudes, Scherzo, Mazurkas and Grand Polonaise. Particularly, the impression of listening to a real mazurka was given by her light touch in performing Chopin's Mazurkas.

The seventh musical concour, sponsored by the Tokyo Nichi Nichi Shimbun, was held at the Hibiya Public Hall on November 18th and 19th. The successful competitors at the preliminaries which had been held previously included eight instrumentalists, eight vocalists and six composers. The first day of the concour was devoted to the contest of the instrumentalists with the result that the first place in the section of stringed music was won by Hisako Tsuji while the second place was left uncaptured and the third place was taken by Shizu Shigematsu. The first place in the piano section was won by Sonoko Tanaka, the second place by Hinako Tsuzuki and the third place by Fumiko Orii and Masami Watanabe. The contests on the second day resulted in the first place in the composition section being captured by Toshiharu Ichikawa, the second place by Kiyohiko Kishima and the third place by Kisei Kobayashi. The winner of the second place in the vocal section was Hisako Tezuka and that of the third place was Shingo Endo while the first place was left uncaptured. The Education Minister's prize was awarded to Hisako Tsuji as the most excellent performer among the successful competitors at the finals. The fact that Miss Tsuji is bearly thirteen adds to the lustre of her performance and testifies to an eminently promising future that awaits her.

The musical concours have been recording a definite improvement every year. A notable fact about the seventh concour was that its results exceeded the restrained expectations entertained in view of the wartime conditions.

Other important events of the month follow: A piano recital by Professor Helmut Dignas of the Musashino School of Music on the 10th of November at the Nihon Seinen Kan, presenting the works of Mozart, Beethoven, Brahms and Liszt; a concert by Professor Willy Fley and Professor Kisei Iguchi, both of the Tokyo School of Music, the programme including Szymanowski's "Sonate en re min. op. 9" and Ernst's "Violin Concerto" both of which were played for the first time in this country, and Beethoven's "Kreutzer Sonate"; and Mr. Iguchi's recital of a selection of Chopin's works.

The Pro Arte Trio which had been experiencing an active period gave a concert at the Meiji Seimei Hall on the 29th November, enlivening the rather depressed chamber music circles in the country. The programme included Schubert's Trio op. 100, Lalo's Trio op. 26 and Mendelsshon's Trio op. 49. The 12th competition chorus festival, sponsored by the National Musical Association, took place on the 23rd, at which the first place was taken by the Mixed Chorus of the Tamagawa Gakuen, the second place by the Tokyo Lieder Tafel Phelein, the third place by the Euphonic Chorus and the fourth place by the Brahms Choir. The competition festival has gradually expanded in scale, the competitors at the 12th festival including 12 male choruses, 4 female choruses and 7 mixed choruses.

The New Symphony Orchestra gave two regular concerts in the same month. The 196th regular concert included Atterberg's Ballade und Passacaglia, Bach's Klavier-konzert, Bizet's Suite de Concert and Verdi's ouverture "I Vespri Siciliani". Haruko Fujita acted as the soloist at the concert. The programme of the 197th concert included Beethoven's 7th Symphony, Chopin's Piano-Concerto, Sibelius's Finlandia op. 26 No. 7 and Gotovac's Kolo Symphonique, the soloist being Chieko Hara who had just returned from a tour in Europe. Among the other musical events of the month were the first public performance by the students of Tamaki Miura's Opera Music School who staged Rossini's "Le Barbier de Serille", a concert by the Musashino Music School, a piano recital by Noboru Toyomasu, and a recital by Professor Leo Sirota who as usual displayed himself as an artist of the first order.

The month of December also recorded a large number of concerts which attracted the attention of the musical public. Particular mention must be made of the piano recital by Professor Leonid Kreutzer of the Tokyo School of Music, the first concert announcing the works of Professor Heki Hosokawa of the composition department of the Tokyo School of Music, the performance of Beethoven's 9th Symphony by the New Symphony Orchestra conducted by Rosenstock.

Professor Hosokawa made his debut at the Hibiya Public Hall on the evening of December 4th to present his symphonic works. He is a graduate of the Tokyo School of Music, and studied for five years at the Vienna conservatoire where he won the honour diploma for compositions in 1934. One of his

Digitized by Google

Kisei Iguchi was at the piano and his performance was praised as showing the highest technique displayed by a Japanese artist in regard to that special piece. Further, the New Symphony Orchestra gave a special public concert on Verdi's Requiem, the soloists including Nagato (soprano), Yanagi (contralto), Kinoshita (tenor) and Yadabe (bass).

Two regular public concerts of the New Symphony Orchestra were held in May, at which Dvorak's Violin Concerto C moll (violin by Willy Frey), Smetana's "Mordaw" and Sibelius's Symphony No. 4 A moll as well as Schumann's Piano Concerto A moll (piano by Sonoko Inoue) were rendered. On the 10th of the same month, the Vocal Four Chorus gave its 6th opera performance on Mascagni's Cavalleria Rusticana and Leoncavallo's Pagliacci. On the 17th of the month, the Pro-arte Trio presented trios by Brahms and Tchaikowsky at its third public concert. Three days later, Leonid Kreutzer of the Tokyo School of Music gave a piano recital at the Hibiya Public Hall, the programme including Beethoven's Waldstein Sonata, Schumann's Carnival, Ravel's Sonatine and Chopin's "12 Etudes." Other events in the month included a vocal recital by Netke Loewe, a vocal recital by Kayoko Izaki and a concert on Palestrina's Missa Brevis and Beethoven's Christus am Oelberge, with Tsugawa acting as the conductor. This concert together with the performance of Verdi's Requiem in April formed the two best concerts of religious music in recent times. An opera performance for the revival of Nobuko Hara as prima donna was held on the 21st of the month at the Hibiya Public Hall, the numbers given including Puccini's "Mano Lescant" and Giardano's "Fedora." The composers' society named La Societe des Compositeurs Contemporains du Japan also held its sixth annoucement concert covering the works of seven young composers.

The month of June witnessed two opera performances. One of them was given by Tamaki Miura the programme consisting of "La Boheme," "Tosca" and "Madam Butterfly" and others. The other was the first public performance by the Opera-Pavot and was held at the Yurakuza theatre, gaining considerable popularity for the rendering of Suppe's Baccacio. On the 15th and the 16th of June the New Symphony Orchestra gave its 193rd regular public concert under the direction of Rosenstock, rendering Beethoven's Symphony No 9. The soloists included Taneko Seki (soprano), Shizuko Saito (contralto), Tamotsu Kinoshita (tenor) and Keikichi Yadabe (bass), and the chorus was provided by the Tokyo Music High School and the Tamagawa Gakuen. The Tokyo School of Music gave a concert at which its two new instructors, Hermut Fermer and Ria von Hessert, performed for the first time before the Japanese public. Teruko Tsuji gave a recital of Yamada's "Madam Postmani" and others to the accompaniment of the New Symphony Orchestra conducted by Kosaku Yamada. On the 21st, Miwako Kai gave a recital of Brahms's Sonata F moll and others at the Nihon Seinen Kan.

In July, the New Symphony Orchestra gave a promenade concert at the Hibiya Public Hall under the direction of Rosenstock.

In September the New Symphony Orchestra gave its 194th public concert. The programme included Ravel's "Valses nobles et sentimentales," Godovac's "Kolo symphonique" and de Falla's "El Sombrero de Tres picos." Particularly, the work of Godovac produced a deep impression upon the audience on account of its modern colour.

In October, Professor Tamotsu Kinoshita of the Tokyo School of Music gave his second recital with a rendering of Schumann's "Dichterliebe," "Liederkrers" and "Myrten." The 195th public concert of the New Symphony Orchestra, which was held during the month, attracted special attention from the public because the programme included Saburo Moroi's Symphony No. 2 which is an outstanding example of the great progress achieved by Japanese composers. Further, Rachmaninoff's Piano Concerto No. 3 was rendered with Sonoko Inoue at the piano. On the 26th, Yoshie Fujiwara gave his first public performance after his return from abroad.

The month of November witnessed a succession of many important concerts. With the conclusion of the major operations in the China incident, the musical circles which had been passing through a dull period showed signs of renewed activity. Among the various events, the piano recital of Miss Chieko Hara and the seventh musical concour deserve special mention. Miss Hara had just returned from a tour of various European cities and at the first recital after her return from abroad showed her ability as a first rate pianist in spite of her young age, displaying in her various numbers a freshness and originality all her own.

Digitized by Google

Roman Dukson was the soloist at the concert, playing Haydn's cello concerto. Stravinsky's "Jeu de Cortes" was performed at the concert for the first time in this country. At the same concert, the audience was given the impression that the New Symphony Orchestra had improved its technique to a considerable extent under the instruction of Prof. Rosenstok.

February—As the musical season for the spring was nearing its best, noteworthy concerts were increasing in number. As the main event of the month, mention must be made of the 200th memorial public concert given by the New Symphony Orchestra. It told of a history lasting for more than 10 years for the New Symphony Orchestra which has been giving about 12 public concerts every year. Special arrangements were made for the orchestra to play on the occasion the same numbers that it had given at its first regular public concert over 10 years ago, by way of manifesting the improvement in technique which it had accomplished since then. Pro Arte Trio gave its second public concert in the month, performing works by Mozart and Dvorak. Other concerts given during the month included those by the Concert Populaire and the Contemporary Composers' League of Japan.

March—With the mission of promoting the anti-Communist friendship between Japan and Manchoukuo, the Harbin Symphony Orchestra visited Japan and gave four concerts. The orchestra was conducted also by Leonid Kreutzer, besides its regular conductor Sergei Schwaikowsky, and performed with Kreutzer, Miwako Kai, Moguirewsky, Haruko Fujita and Yoshiye Fujiwara acting as soloists. The Yoshiye Fujiwara's opera company gave its 7th public concert, performing Carmen for two evenings, March 26 and 27, with great success. The role of Carmen was performed by Akemi Yuri, rising star in the musical world, while Toshiko Nakamura played the part of Micaela.

Besides, the Pro Arte Trio gave its 3rd concert, performing works by Beethoven, Smetana and Ravel. This concert showed clearly that the trio had been conducting a serious study since its inauguration.

Digitized by Google

compositions, the Symphonische Dichtung "Nori no Yube" (Gebet von Weltall) had been broadcast from Vienna and received favorably. The programme for his first announcement concert included such great works as Kleine Suite "Marchen von Japan," Klavier-konzert C dur, Mezzosoprano solo "Zwei Lieder" and Aus Oper "Buddha" Ire Akt, Grosse Liebesarie, and Suite zu der Gedichten des Meiji des Grossen as well as Symphonieshe Dichtung "Nori no Yube" (Gebet von Weltall). The compositions were played by the New Symphony Orchestra under the baton of the composer himself, with Professor Leo Sirota acting as the piano soloist and Professor Ria von Hessert as the mezzosoprano soloist while the chorus was supplied by the members of the Tamagawa Gakuen and the Tokyo Mixed Choruses. It may be said here that Hosokawa and Saburo Moroi are the two most outstanding symphony composers in Japan.

Professor Kreutzer gave his concert at the Hibiya Public Hall on the evening of December 6th, performing Brahm's Rhapsodie E flat major, Beethoven's Sonate F minor (Appassionata), Chopin's Sonate B minor op. 58 and Liszt's Etude de concert D flat major and Hungarian Rhapsody No. 12, etc. This concert by Professor Kreutzer who is reputed to have been gaining remarkably in the mellowness of the notes produced at the piano was praised as the greatest event of the season. The New Symphony Orchestra gave two special concerts on December 26th and 27th at the Kabuki Theatre, performing the 9th Symphony by Beethoven for the second time during the year. The performance of the great symphony was conducted by Rosenstock, after the overture "Leonore" No. 3 had been played, with Taneko Seki (soprano), Fumiko Yotsuya (mezzosoprano), Tamotsu Kinoshita (tenor) and Keikichi Yadabe (bass) acting as the vocal soloists while the choir was furnished by the choruses of the Tokyo Koto Ongaku-in and the Tamagawa Gakuen. Further, the New Symphony Orchestra, at its 198th regular concert which was given on the evening of December 14th, performed for the first time in this country A. Roussel's "Suite," Schumann's Violin Concerto and Godaly's Danse Maroc, with Professor Willy Fley of the Tokyo School of Music acting as the violin soloist.

Kenshu Wanibuchi, newly returned violinist, gave a recital on the evening of December 1st, performing Beethoven's Kreutzer Sonate, Paganini's Concerto D minor, etc. On December 2nd, Miwako Kai and Maxim Chapiro gave their duet, the programme including selections from Mozart, Busoni and Rachmaninoff. The second regular public concert under the name of "An Evening of Modern and Contemporary Music" was held by the Nippon Musical Performers' League on December 5th. Yoji Ohtakuro (tenor), Chieko Hara (piano), Yoshiko Tetsu (soprano), and others participated in the concert. The Concert Populaire gave an "Evening of Modern Music" on the evening of December 6th, performing orchestral works by Borodin, Stravinsky, Sibelius, Duparc, Faure and Debussy.

Romann Dukson and Isako Kurokawa, both of the Tokyo School of Music, gave a concert which enlivened the depressed 'cello circles. The programme consisted of Rachmaninoff's Sonate, Reger's Suite, Beethoven's Sonate (Appassionata) and Schubert's "Arpegionen Sonate." Kosaku Yamada conducted the New Symphony Orchestra, the pieces played being Mozart's overture "Le Nozze di Figaro," Dvorak's New World's Symphony, Mozart's Serenade and Beethoven's overture "Leonore" No. 3, at a concert given in the same month.

The department of arts of the Nihon University organized a symphony orchestra with Heigoro Komatsu as its conductor, which gave its first concert at the Nihon Seinen Kan on December 9th. The programme consisted entirely of Beethoven's works including the overture "Egmont," Symphony No. 1 and Piano Concerto No. 3. Kikuko Fukuda acting as the piano soloist.

Madame Sophie Zaitseff, soprano who had recently come to this country, gave a concert on December 9th, singing Schubert's Lieder and songs by Russian composers and three airs with Michio Miyagi playing the koto accompaniment. Other musical events of the month included the sixth performance by the Tokyo Concert, and concerts by the Toyo Music School and the Tokyo School of Music. In this connection, it must be noted that the concert by the Tokyo School of Music, which was given under the direction of the new conductor Helmut Fermer, was enthusiastically received, the piece which was liked in particular being Mozart's Requiem.

January — On account of the New Year season, the musical circles were rather inactive. Nevertheless, Chieko Hara and Prof. Kreutzer gave their recitals while the New Symphony Orchestra gave its 199th public concert.

CHAPTER XXXVI

SPORTS

Japan in the World Olympics

Stockholm and Antwerp Japan participated in the World Olympic Games for the first time in 1912, at Stockholm, when only two athletes represented the country. They were Shizo Kanaguri, marathon runner, and Yahiko Mishima, short-distance runner, both of whom were miserably defeated. In the following Olympiad, which was held in Antwerp in 1920, 15 Japanese took part. Of these, 11 were track and field men, and the others were two swimmers and two tennis players. Neither the track and field men nor the swimmers placed. The tennis entrants won second place.

The Paris Olympiad Japan made its real debut in the Eighth Olympic Games in Paris in 1924, with 14 men participating. A third place in wrestling was the only official score, but Mikio Oda won sixth place in the hop, step and jump; the swimming team placed fourth in the 800-metre relay; Katsuo Takaishi came in fourth in both the 100-metre and 1,500-metre free style, and Kenkichi Saito took sixth place in the backstroke event.

At Amsterdam The year 1928 found 63 Japanese competing in the Ninth Olympic Games at Amsterdam. The late Miss Kinué Hitomi was the only girl in the Japanese delegation and the first Japanese woman to take part in the Olympics, made impressive performances. She won a 100-metre heat in 12.8 seconds and took second place in the 800-metre finals by negotiating the distance in 2 minutes 17.7 seconds. Mikio Oda not only scored for the first time but won Japan's first Olympic championship by taking the hop, step and jump event. In the swimming competition, an equally bright success was attained by Yoshiyuki Tsuruta, who took first place and the championship in the 200-metre breast-stroke. Kazuo Kimura placed sixth in the running high jump; Yonétaro Nakazawa placed sixth in the pole vault; Kanésaku Yamada placed fourth and Séiichiro Tsuda placed sixth, respectively, in the marathon; Katsuo Takaishi won third place in the 100-metre free style swim; Toshio Iriyé came in fourth in the 100-metre backstroke; the 800-metre relay team placed second. The swimmers won second place in competition with the United States, the championship winner. Japanese took part in the boxing, regatta and equestrian contests for the first time but lost.

At Los Angeles The results achieved at Los Angeles by 131 athletes were satisfactory. The delegation took seven championships, seven second places and four third places.

(1) Aquatic Meet Japan dominated the 1932 aquatic meet as no other nation had done in the past. Of 150 official points scored in the six races, 86 went to Japan and only 46 to all other nations together. The result is Japan 86 and America 33, with the rest outdistanced. Only one race was by a non-Japanese champion, the 400-metre free style, in which Clarence Crabbe, of the United States, and Jean Taris, of France, upset expectations and finished ahead of the Japanese trio in new record time. The only team race, the 800-metre relay, went to Japan by a wide margin in almost incredible time, 8 min. 58.4 sec.

The Japanese swimmers produced both world and Olympic records in the Los Angeles meet. The Japanese 800-metre relay team produced a new world record with a time of 8 min. 58.4 sec. Shozo Makino set a new world mark when he swam the first 1,000 metres in the 1,500-metre free style, broke the Olympic record, 58.6 sec., set by the great American swimmer, Johnnie Weismuller, by negotiating the distance in 58 sec. flat. Others who broke Olympic records were Reizo Koiké, who won the 200-metre brest stroke in 2 min. 44.9 sec., and Katsuo Kitamura, 15-year-old boy, who won the 1,500-metre free style in 19 min. 13.4 sec.

(2) Track and Field Events In the track and field events, the Japanese did not show up so brilliantly as did their team mates in the aquatic events. Thanks to Chuhéi Nambu, however, Japan was able to defend the hop, step and jump championship which Mikio Oda had won at Amsterdam in 1924. With a mark of 15.72 metres, Nambu not only won the championship but established a new world record. Another outstanding performance was turned by Baron Takéichi Nishi, of the Japanese Army,

Digitized by Google

peting in the Olympic Games for the first time, caused a sensation by winning the 200-metre breast stroke in a new Olympic record of 2 minutes and 42.5 seconds. Miss Hideko Maehata was the first Japanese woman to win in the Olympic aquatic event. She won the 200-metre breast stroke for women and set a new Olympic record of 3 minutes and 3.6 seconds.

After the Games, the International Olympic Committee met and awarded Japan the right to sponsor the 12th Olympic Games in Tokyo in 1940.

The Tokyo Olympic Games On account of the Sino-Japanese Conflict in 1937–38 Japan gave up plans for the proposed Tokyo Olympic Games in July, 1938.

Details of the Japanese performances at the Berlin Olympic Games were :

TRACK AND FIELD

5,000-metre run—Kohei Murakoso won 4th place.

10,000-metre run—Kohei Murakoso won 4th place.

Marathon—Son Kitei won for the first time for Japan with a time of 2 hours 29 minutes 19.5 seconds, and Nan Shoryu placed third.

Running high jump—Kimio Yada placed 5th with 1.97 metres.

Running broad jump—Naota Tajima won third place with 7.74 metres.

Hop, step and jump—Naoto Tajima won and defended successfully the title for the third time in row since the Amsterdam meet. Tajima's leap was 16 metres, a new world record.

Pole vault—Shuhei Nishida and Sueo Oye tied for second place with 4.25 metres respectively.

Women's Track and Field

Discus throw—Miss Ko Nakamura and Miss Hide Minejima won fourth and fifth places respectively.

Javelin throw—Miss Sadako Yamamoto placed fifth.

Swimming

100-metre free style—Masanori Yusa won second place, followed by Shigeo Arai and Shoji Taguchi in third and fourth places. Yusa's time was 57.9 seconds.

400-metre free style—Three Japanese mermen finished in first five, namely, Shumpei Udo in second place, Shozo Udo was timed in 4 minutes 45.6 seconds.

1,500-metre free style—Noboru Terada won with a time of 19 minutes 13.7 seconds. Two other place winners were Shumpei Udo who came in third and Sunao Ishiwarada who finished fourth.

800-metre relay—Japan's team won, members being Yusa, Sugiura, Taguchi and Arai. Time, 8 minutes 51.5 second.

100-metre back stroke—Shoichi Kiyokawa won third place with a time of 1 minutes 6.4 seconds. Kiichi Yoshida placed 5th and Yasuhiko Kojima 6th.

200-metre breast stroke—Tetsuo Hamuro won. Time, 2 minutes 42.5 seconds. Two others who placed were Reizo Koike, third, and Saburo Ito, fifth.

High diving—Tsuneo Shibahara placed sixth.

Spring board diving—Tsuneo Shibahara took fourth place.

Women's Swimming

400-metre free style—Miss Kazue Kojima placed sixth.

200-metre breast stroke—Miss Hideko Maehata won. Time, 3 minutes 3.6 seconds.

High diving—Miss Reiko Osawa won 4th place and Miss Fusako Kono finished 6th.

Spring board diving—Miss Masayo Osawa placed sixth.

Wrestling

Free style

Featherweight—Kozo Mizutani ranked 6th.

Lightweight—Eiichi Kazama ranked 5th.

Boxing

Bantamweight — Shumpei Hashioka ranked 5th.

Equestrian competition

Steeplechase—Japanese team, composed of Captain Baron Takeichi Nishi, Lieutenant Hiroji Inaba and Lieutenant Manabu Iwabashi, placed 6th with 75 penalties.

The Tenth Far Eastern Olympiad

The Tenth Far Eastern Championship Games were held in Manila between May 12 and 21, 1934. Much trouble was created in Japan before the Japan Amateur Athletic Federation finally decided to participate in the event. The Japanese side proposed to the headquarters of the Championship Games that Manchoukuo, represented by the Manchoukuo Amateur Athletic Federation, should be allowed to participate in the event. A protest was raised by both China and the Philippines that the matter had to be submitted to a general conference of the participating countries and the Constitution of the Games be revised for admittance of Manchoukuo. This attitude angered those supporting the Manchoukuo side and caused them

Digitized by Google

to advise the Japan Amateur Athletic Federation to withdraw from the event, unless the matter was accepted. The matter was telegraphed to the Manila headquarters, but the reply was that it had to be submitted to a general meeting for approval. In the midst of a vigorous opposition, the Japanese Federation submitted to its general meeting a plan whether it had to attend the games in Manila or renounce its right to participate, leaving the Manchoukuo Federation, and finally it was decided the Federation would attend it with a determination to discuss matters regarding the Manchoukuo participation in the next event and to withdraw from the Games, if Constitution could not be revised so as to let the Manchoukuo participation possible. In course of the games in Manila, the matter was discussed, but failed to be adopted by unanimous consent. In consequence, the Japanese Federation made up its mind to depart from the Games and to organize a new athletic federation with the object of promoting physical culture. Japan, however, participated in the Tenth Games throughout. On June 12, after the return of the Japanese sports delegation to Japan, it was resolved by the delegation that the Japanese Amateur Athletic Federation withdraw from the Far Eastern Championship Games and organize the Amateur Athletic Association of the Orient. Japan, Manchoukuo and the Philippines have decided to join the new Federation, but China will not join it. Thus the Far Eastern Championship Games have been forced to break up.

Results of the Tenth Far Eastern Championship Games follow:

Development of Western Sports

The History Young When a Japanese refers to "sports," he usually means Western athletic sports, not the traditional sports of Japan. The tremendous interest of the Japanese in Western sports and the remarkable development that they have made in them have relegated Japan's own sports to the background. One may pay tribute to the athletic prowess of the Japanese and their adaptability and capacity for assimilation, but one strong reason for the great popularity of the sports from the West may be sought in the fact that most Western sports are played collectively, instead of individually as in the case of Japanese fencing and judo, and they appear to suit the race in their modern mode of life. Western sports, moreover, offer the Japanese an opportunity to compete with other athletic nations and demonstrate their ability. This gives more incentive for their enthusiasm for foreign sports.

Despite their remarkable growth, Western sports in Japan are very young, and their history is a matter of only half a century. Sixty years ago, no Western sport worth the name existed in Japan. The fact that Japan could send only two athletes to the World Olympic Games for the first time as late as 20 years ago and suffered a miserable defeat is indicative of the slight athletic progress the conutry had attained up to that time. Except for baseball, which was played zealously even in the earlier years, it is no exaggeration to say that Japan's participation in the World Olympics provided the real incentive for the growth of Western sports in general.

The Far Eastern Olympiad It should be added in this connection that, one year after Japan's first participation in the World Olympics, the Far Eastern Olympic Games were organized, with Japan, China and the Philippines as the participants. There is little doubt that this minor Olympics had a great deal to do with athletic development in Japan. As in the case of the World Olympics, Japan had an insignificant beginning as far as points go, but in 1930 the country so completely defeated the Philippines and China that one who was acquainted with the remarkable athletic progress in Japan doubted the usefulness of further competition in the Far Eastern Olympic Games. The first meet of this junior Olympics was held at Manila in 1913, and since then successive Far Eastern Olympic Games have been held every other year. In 1930, when the last meet was held in Tokyo, it was agreed to hold the meet every four years so that it would not clash with the World Olympics. The last Far Eastern Olympic Games took place in Manila in May, 1934. In addition to the World and Far Eastern Olympic Games, there have been from time to time frequent exchanges of visits between Japanese athletic teams and those of foreign countries, which not only offered the Japanese opportunities to learn valuable lessons but proved good

Digitized by Google

for a closer international friendship.

The Re-organization of the Japan Amateur Association The Japan Amateur Athletic Association was reorganized as the highest regulating body for sports in Japan, on May 19, 1936. The Association was able to perfect its organization with the affiliation of sixteen other athletic bodies and became the most important sports governing body in Japan. The important work for the Association in 1935 was the sending of the delegation to the 11th Olympiad in Berlin and exerting its best efforts to invite the 12th Olympiad to Tokyo.

As regards the sending of the delegation the Association succeeded in obtaining the fund. A subsidy of ¥300,000 was granted by the Government and public donations amounting to ¥400,000 were obtained these two making a total fund of ¥700,000 for the despatch of the delegation. It was thus possible to send 47 athletes to the 4th Winter Sports Games and also a large and imposing delegation composed of 68 officials and 246 athletes representing 13 events to the 11th Olympiad in Berlin.

Traditional Sports Of Japan's traditional sports, those which have remained from ancient times and which still hold the interest of the people include jujitsu (judo), known as the art of self-defence; kenjutsu (kendo), or fencing; sumo, or wrestling, and swimming (native styles). All these major sports are still being practised throughout the country. Probably the most popular is wrestling. At the Kokugikan amphitheatre at Ryogoku, on the bank of the Sumida River, which flows through Tokyo, a professional wrestling tournament is held twice a year, in January and May. H. I. M. the Emperor invites almost each year not only professional wrestlers but jujitsu and fencing masters of the land to the palace for matches in His Majesty's presence. In addition to these Japanese sports, there are others, such as archery and horsemanship of ancient origin, but they have suffered more or less decadence since the overthrow of feudalism.

Under Education Minister All sports in Japan are controlled either by the Ministry of Education or the Ministry of Health and Social Affairs. All students' sports are under the jurisdiction of the Education Ministry, and such non-student affairs as Japanese professional wrestling and professional boxing are under the control of the Ministry of Health and Social Affairs. Matters such as the maintenance of peace and order in and around the wrestling amphitheatre or boxing ring are in the hands of the local police.

The leading athletic organization in Japan is the Japan Amateur Athletic Association, mentioned above, with Ryozo Hiranuma as acting president. This is the organization which controls track and field games in Japan and selects athletes for international meets. There are other similar organizations, such as the Japan Amateur Swimming Federation and the Japan Lawn Tennis Association.

Records Various statistics of records made by Japanese athletes follow:

JAPAN'S AND WORLD'S TRACK AND FIELD RECORDS

Running

Event	Japan's Record	World's Record
100-meter	10.3s. Ryutoku Yoshioka (1935)	10.2s. Jesse Owens, U.S.A. (1936)

Baseball

Baseball is the most popular and most widely played game in Japan. Sumo, the Japanese style of wrestling, had been known for many years as the national game, but baseball came from the United States and caught popular fancy. The American pastime is now recognized as the de facto national game

Digitized by Google

of this country. The Japanese are agile by nature and gifted with quick headwork and therefore are fitted to play baseball, although their weakness in batting is admitted. American professional players who have been to Japan and played with the Japanese have said that the Japanese are good pitchers and good fielders, but poor hitters and have recommended that efforts be made to improve batting.

Its Inception Like track and field sports, baseball was brought to Japan in the early years of Meiji. It is recorded that baseball was introduced by two American teachers in 1872. Not much progress was made until after 1890. The First Higher School is known as the first school which organized a strong team. Keio University and Waseda University also organized teams. Games began to be played between those schools with much zeal. In 1905, Waseda University sent its team to the United States. It played 27 games and won seven, but the team brought to Japan new tactics, such as winding and bunting, which had been unknown here until that time. Organized cheering was begun about the same time. From then on, American university teams, such as those of St. Louis, Wisconsin, Washington and Chicago Universities, came to Japan. At first, the American invaders were sure to win. As years went by, baseball in Japan developed greatly, however, and now it is admitted that Japanese university teams are on a par with American 'varsity nines. Hence the almost semi-annual exchange of university baseball teams between Japan and the United States.

Its Development The development of baseball in Japan owes much to the visits of American professional players. In 1913, Japan invited the leading players of the New York Giants and the Chicago White Sox to play with the Japanese and to coach them. In 1931, a picked American professional team came under the management of Mr. Herb Hunter. Those Big League players not only impressed the Japanese with spectacular playing but also opened their eyes to the possibilities of further improvement in technique. In 1932, Mr. Hunter brought here Frank (Lefty) O'Doul and a few other Big League players for the purpose of coaching Japanese university players.

The University League The game was laid on a firm foundation in 1925 when the present Big Six-University Baseball League of Tokyo was organized among Waseda, Keio, Meiji, Hosei, Rikkyo and Imperial Universities. Of the semi-annual league series, the most popular is the Waseda-Keio, series, the interest in which is high, as in the Cambridge-Oxford regatta, because of the historical background. Before the present league was formed, Waseda and Keio had such keen rivalry that blood shed was caused at one of the games and the series had to be abandoned for 20 years. The creation of the league revived the series, and they are now the "World Series of Japan." Each Waseda-Keio game is usually attended by a capacity crowd of 55,000 at the Meiji Jingu (Shrine) grounds, Tokyo.

In the semi-annual league seasons, each university plays a two-game series with the others. The championship winners were formerly decided on the basis of the number of series won, but now the number of games won.

The following tables show the final standing of the autumn season of 1938 and the spring season of 1939:

1938 Autumn

	Meiji	Keio	Waseda	Hosei	Rikkyo	Imp.	Won	Draw	Rate gained
Meiji	×	1	2	1.5	2	1.5	7	2	80.0
Keio	1	×	0	1.5	2	2	6	1	65.0
Waseda	0	2	×	0	2	2	6	0	60.0
Hosei	0.5	0.5	2	×	1.5	0.5	3	4	50.0
Rikkyo	0	0	0	0.5	×	2	2	1	25.0
Imperial	0.5	0	0	1.5	0	×	1	2	20.0
Lost	1	3	4	3	7	7			

Meiji won the pennant.

To decide upon the place of Waseda and Keio who gained the same rate of victory an extra game was played between them on June 5, and Waseda won the pennant.

Professional Baseball Japan now boasts of eight professional baseball teams, four in Tokyo and two each in Nagoya and Osaka. They are Tokyo Giants, Eagles, Tokyo senators and Lions in Tokyo; Nagoya and Golden Dolphins in Nagoya; Hankyu and Osaka Tigers in Osaka. The teams were formed during 1934 and early 1936, all possesing former leading baseball players from colleges and middle schools.

The Japan Professional Baseball League, a governing body for these professional teams, was founded in 1936, with leading men of each team in its official board. The league is headed by Marquis Nobutsuné Okuma, president of the Tokyo Giants. Each team is operated as sister companies of leading newspaper or railway companies, and some of them are financed by a group of business men. The Tokyo Giants is the oldest among them, founded in late 1934, and is backed by the Yomiuri Shimbun, leading Tokyo newspaper. The team made a tour of the United States twice already in 1935 and 1936, each time their trip extending for three months. Most of the professional teams are stronger than those of the Tokyo University League and their future is very promising.

The three championship series among the professional teams were held in Tokyo, Osaka and Nishinomiya in 1938, and resulted as follows:

Spring 1938

	Games	Won	Lost	Draw	%
Tigers	35	29	6	0	.829
Giants	35	24	11	0	.686
Hankyus	35	21	13	1	.618
Eagles	35	18	15	2	.545
Senators	35	13	21	1	.382
Dolphins	35	13	22	0	.371
Nagoyas	35	11	24	0	.314
Lions	35	9	26	0	.257

Tigers retained the pennant.

Autumn 1938

	Games	Won	Lost	Draw
Tigers	40	30	9	1
Giants	40	27	13	0
Hankyus	40	21	17	2
Nagoyas	40	19	18	3
Senators	40	19	20	1
Lions	40	19	20	1
Eagles	40	15	20	5
Nankai	40	11	26	3
Dolphins	40	11	29	0

Tigers retained the pennant.

Marking as one of the biggest events in the history of the Japanese baseball, 15 star baseball players of the American major leagues, made a barnstorming tour to Japan in the fall of 1934 at the invitation of the Yomiuri Shimbun. They arrived in Yokohama on November 2 and stayed for a month during which they made a clean sweep of winning 18 games against the All Japan nine in the leading cities of this country. Mr. Connie Mack, the veteran baseball coach and manager of the Philadelphia Athletics Club, was the leader of the team.

The American team, including such famous players as Babe Ruth, homerun King, Lou Gehrig, Jimmy Foxx and Charles Gehringer, were given a tremendous welcome by the Japanese baseball fans in every city they visited. Every baseball ground where they played, were filled to more than its capacity with the enthusiastic fans, who were, in return, treated with amazing and excellent play by the visitors, both in batting and fielding. Especially Babe Ruth was the centre of attraction, his play being observed keenly by the Japanese. He was also chased around heavily by a large number of autograph hunters wherever he appeared, just in the same way as in his home country.

The All Japan team which was specially formed to meet the American stars with the former star players in the Japanese college leagues, the strongest nine Japan could offer then, was beaten by a one-sided score by the visitors in almost every game they played. A total of 47 home runs was recorded by the American players during their sojourn, with Ruth leading with 13. A name of "home run team," was given by the Japanese fans for their heavy and amazing batting works by Ruth, Gehrig, Foxx, Averill and Gehringer, who all hit home run

Digitized by Google

more than four each.

The American team was composed of the following players :

Eric McNair (Philadelphia Athletics), shortstop.

Charles I. Gehringer (Detroit Tigers), second base.

Babe Ruth (New York Yankees), left field and first base.

Lou Gehrig (Yankees), first base.

James Foxx (Athletics), third base.

Earl Averill (Cleveland Indians), centre field.

E.J. Miller (Athletics), right field.

Morris Berg (Cleveland), catcher.

Frank Hayes (Athletics), catcher.

Vernon Gomez (Yankees), pitcher.

Earl Whitehill (Washington Senators), pitcher.

Clinton H. Brown (Cleveland), pitcher.

Edward Cascarella (Athletics), pitcher.

Hal Warstler (Athletics), substitute for infielder.

Frank O'Doul (New York Giants), outfielder.

Mr. John A. Quinn, the noted Southern League umpire, acted as chief umpire.

Results of the games follow :

Americans 17–1 Tokyo Club (Meiji Shrine Grounds, Tokyo, November 4)

Americans 5–1 All Japan (Meiji Shrine Grounds, Tokyo November 5)

Americans 5–2 All Japan (Yunokawa Grounds, Hakodaté, November 8)

Americans 7–0 All Japan (Yagiyama Grounds Sendai, November 9)

Americans 10–0 All Japan (Meiji Shrine Grounds, Tokyo, November 10)

Ruth team 13–2 Miller team, exhibition (Meiji Shrine Grounds, Tokyo November 11)

Americans 14–0 All Japan (Jintsu Grounds, Toyama, November 13)

Americans 15–6 All Japan (Meiji Shrine Grounds, Tokyo, November 17)

Americans 21–4 All Japan (Yokohama Park Grounds, Yokohama, November 18)

Americans 1–0 All Japan (Shizuoka City Grounds, Shizuoka, November 20)

Americans 6–5 All Japan (Narumi Grounds, Nagoya, November 22)

Americans 6–2 All Japan (Narumi Grounds Nagoya November 23)

Americans 15–3 All Japan (Koshien Grounds, Hyogo, November 24)

Miller team 5–1 Ruth team exhibition (Koshien Grounds, Hyogo, November 25)

Americans 8–1 All Japan (Itatsu Grounds, Kokura, November 26)

Americans 14–1 All Japan (Kyoto City Grounds, Kyoto, November 28)

Americans 23–5 All Japan (Omiya Grounds, Saitama, November 29)

Americans 14–5 All Japan (Utsunomiya Grounds, Tochigi, December 1)

Track and Field

The birth of track and field sports in Japan dates back to the Meiji Restoration in 1868. In the following year, a physical training course was added to the curriculum of middle schools, which consisted of gymnastics introduced by the Dutch. In the meantime, those who returned home to Japan from abroad, much impressed by athletics in foreign countries advocated the introduction of Western athletics. Several foreign teachers were invited to teach athletics as well as English. Running and jumping were taught, but progress was slow. The first Japanese track and field meet was held in Tokyo in 1884, but the first really systematic athletic meet was not held until 1886. At the latter meet, programmes were printed. It was an epoch-making event. Track and field events about 1889 and 1890 were almost the same as they are now. There were the 100, 220, 400, 880 yards, the 100 yard hurdles, cricket ball throw, the three-legged race and so on. As for records, the best was 10.8 seconds for the 100-yard dash and 18 seconds for the 100-yard hurdles. From that time on, progress was gradual until 1912, when Japan took part in the World Olympic Games for the first time. An outline of the progress of Western sports in Japan in subsequent years is given in the first section titled "Japan in the World Olympics."

At the invitation of the Japan Amateur Athletic Federation, the American track and field stars, captained by Glenn Cunningham, the world famous distance runner, visited Japan in September, 1934, for a series of contests against the leading Japanese athletes. They were the first and strongest athletic force ever came to Japan from the United States, and staged one of the biggest track and field events in this country.

The Americans with 14 members, engaged in two dual meets with the selected Japanese team in Tokyo and Osaka, and appeared in five exhibition contests, visiting Nagoya, Dairen, Seoul and Fukuoka. Their visit was successful, contributing much to Japan's athletic circle and also toward the international friendship between the two countries. The Americans won the first dual contest, held on September 8 and 9 in Tokyo, by a score of 84 points to 75, but lost the second meet to Japan by a close 77½ points to 75½ in Osaka a week later, which was an unexpected victory for the local side. Three world and 13 Japanese records were shattered in these dual contests.

Digitized by Google

Ralph Metcalfe, the ranking dusky American sprinter, covered the 200-metre course in 20.2 seconds, clipping four tenth of a second from his own world mark, both in Tokyo and later in the Dairen meet. Another world record was bettered by a Japanese, Kenkichi Oshima, former Kwansai University ace, who won the hop, step and jump event with a leap of 15.82 metres in the second dual meet in Osaka. The former world record for this event was 15.72 metres held by Chuhei Nambu of Japan, a sensation in the last Olympic Games in Los Angeles.

Members of the American team were: Glenn Cunningham (Kansas University); John Anderson (Cornell University); Robert Clark (Olympic Club); Frank Crowley (Manhattan College); Gorden Dunn (Stanford University); Donald Favor (University of Maine); Phil Good (Bordoin University); Howard Greene (Abilen Christian College); Charles Hornbostel (Indiana University); Walter Marty (Fresno State University); Ralph Metcalfe (Marquette University); Charles Parsons (University of Southern California); Wirt Thompson (Yale University); and Dudley Wilkins (Louisiana State University). Coach—Mr. John Magee, vice-president of the American Athletic Union.

Winners of the first dual meet were:

Track Events

100-metre dash, Ralph Metcalfe (United States), 10.5 seconds; 200-metre dash, Metcalfe (United States), 20.2 seconds (new world record); 400-metre run, Charles Hornbostel (United States), 49.2 seconds; 800-metre run, Hornbostel (United States), 1:54.0 minute; 1,500-metre run, Glenn Cunningham (United States), 4:8.6 minutes; 5,000-metre run, Ryu Choshun (Japan), 15:41.8 minutes; 110-metre high hurdles, Phil Good (United States), 14.6 seconds; 400-metre relay, American team (Clark, Greene, Parsons and Metcalfe), 41.3 seconds; and Swedish relay, American team (Metcalfe, Parsons, Greene and Hornbostel), 1:57.6 minutes.

Field Events

High jump, Yoshiro Asakuma (Japan), 1.95 metre; broad jump, Masao Harada (Japan), hop, step and jump, Keinkichi Oshima (Japan), 15.28 metres pole vault, Suyeo Oyé (Japan), 4 metres; Shot put, Gorden Dunn (United States), 15.-26 metres; discus throw, Dunn (United States), 47.42 metres; hammer throw, Isao Abé (Japan), 48.98 metres; and javelin throw, Saburo Nagao (Japan), 62.07 metres.

Points scored:

United States		Japan
6	800-metre run	4
4	Broad jump	6
7	Discus throw	3
7	100-metre dash	3
3	High jump	7
4	5,000-metre run	6
3	Javelin throw	7
4	400-metre relay	1
7	400-metre run	3
6	Shot put	4
4	Pole vault	6
6	High hurdles	3
4	Hammer throw	6
7	200-metre dash	3
3	Hop, step and jump	7
5	1,500-metre run	5
4	Swedish relay	1
84		75

Winners in the second dual meet were:

Track Events

100-metre dash, Ralph Metcalfe (United States), 10.3 seconds (tied the world record); 200-metre dash, Metcalfe (United States), 21.4 seconds; 400-metre run, Charles Hornbostel (United States), 49.2 seconds; 800-metre run, Glenn Cunningham (United States), 3:58.4 minutes; 5,000-metre run, Frank Crowley (United States), 16:8.6 minutes; 110-metre high hurdles, Tadashi Murakami (Japan), 14.6 seconds; and Swedish relay, Japanese team (Yoshioka, Taniguchi, Miyanagi and Imai), 1:57.5 minute.

Field Events

High jump, Yoshiro Asakuma (Japan), 2 metres; broad jump, Masao Harada (Japan), 7.59 metres; hop, step and jump, Kenkichi Oshima (Japan), 15.82 metres (new world record); pole vault, Suyeo Oyé (Japan), 4.20 metres; shot put, Gorden Dunn (United States), 15.-62 metres; discus throw, Dunn (United States), 46.43 metres; hammer throw, Donald Favor (United States), 51.16 metres; and javelin throw, Saburo Nagao (Japan), 62.98 metres.

Points scored:

United States		Japan
7	100-metre dash	3
6	200-matre dash	4
7	400-metre run	3
7	800-metre run	3
5	1,500-metre run	5
5	5,000-metre run	5

The 17th annual national open championships (Denen courts, Tokyo, September 26—October 7).

Singles : semi-finals

Yamagishi (Keio) beat Tsuruta, 6-1, 6-1, 7-5.

Takamuku beat Kimura, 7-5, 6-2, 6-2.

Finals

Yamagishi beat Takamuku, 6-4, 6-3, 5-7, 6-2.

Doubles : semi-finals

Nakano and Matsumoto beat Abé and Kawachi, 6-2, 6-2, 4-6, 6-4.

Yamagishi and Tsuruta (Keio) beat Tanaka and Takao, 6-2, 6-3, 12-10.

Finals

Yamagishi and Tsuruta (Keio) beat Nakano and Matsumoto, 2-6, 6-1, 6-2, 8-6.

The following list shows the winners in the annual National Tennis Championship tournament which takes place either in Tokyo or Osaka in November every year :

	Singles	Doubles
1923	Takaichi Harada	Tamio Abé and Ryuzo Kawazuma
1924	Tsumio Tawara	Iwao Aoki and Taizu Ukegawa
1925	Tsumio Tawara	Tamio Abé and Kyo Kawajiri
1926	Yoshio Ota	Hisataka Aizawa and Kengo Asoo
1927	Tamio Abé	Tamio Abé and Masanosuké Fukuda
1928	Hajimé Makino	Seiichi Yamagishi and Hikoshichi Shimura
1929	Takeichi Harada	Ichiya Kumagai and Takechi Harada
1930	Jiro Sato	Seiichi Yamagishi and Hikoshichi Shimura
1931	Takao Kuwabara	Seiichi Yamagishi and Yasuo Murakami
1932	Ryosuké Nunoi	Jiro Sato and Minoru Kawaji
1933	Hideo Nishimura	Hideo Nishimura and Jiro Yamagishi
1934	Jiro Yamagishi	Hideo Nishimura and Jiro Yamagishi
1935	Jiro Yamagishi	Hideo Nishimura and Jiro Yamagishi
1936	Jiro Yamagishi	Jiro Yamagishi and Reizo Murakami
1937	Cram (German)	Cram and Henkel (German)
1938	Jiro Yamagishi	Jiro Yamagishi and Yasuo Tsuruta

Swimming

Swimming is one of Japan's major sports that has been handed down from time immemorial. Surrounded on all sides by the sea, the people of the Island Empire had easy access to water. It was but natural that the people became adept in swimming, and swimming masters turned out several distinct styles of swimming, some of which more or less resembled the Western crawl of the present day. Swimming in ancient Japan was a serious subject of study, especially for the fishermen and warriors, to whom swimming was more a practical necessity than a healthful diversion.

The Western crawl was introduced into Japan about 1910. Since then the Japanese have not only copied but developed it into a more perfect stroke. The result was the remarkable showing made by the Japanese mermen at the Tenth Olympiad in Los Angeles in 1932.

As a partial explanation of the swimming ability of the Japanese, it is said that the race is particularly fitted for prowess in swimming. A modern physician once said that the Japanese show better development than other peoples

1937	Cram (German)	Cram and Henkel (German)
1938	Jiro Yamagishi	Jiro Yamagishi and Yasuo Tsuruta

Swimming

Swimming is one of Japan's major sports that has been handed down from time immemorial. Surrounded on all sides by the sea, the people of the Island Empire had easy access to water. It was but natural that the people became adept in swimming, and swimming masters turned out several distinct styles of swimming, some of which more or less resembled the Western crawl of the present day. Swimming in ancient Japan was a serious subject of study, especially for the fishermen and warriors, to whom swimming was more a practical necessity than a healthful diversion.

The Western crawl was introduced into Japan about 1910. Since then the Japanese have not only copied but developed it into a more perfect stroke. The result was the remarkable showing made by the Japanese mermen at the Tenth Olympiad in Los Angeles in 1932.

As a partial explanation of the swimming ability of the Japanese, it is said that the race is particularly fitted for prowess in swimming. A modern physician once said that the Japanese show better development than other peoples

Digitized by Google

these teams have seasonal clashes. Private clubs and training halls are found in all cities of Japan. Experts receive degrees from the Kodokan.

The list of Japan's outstanding jujitsu experts of the Kodokan includes Nagaoka and Isogai, both holders of Kudan, the highest rank Iizuka, Samura, Tabata and Mifuné, all holders of hachidan, a rank next to the highest.

Kendo (Japanese Fencing)

Together with Judo, the study of Kendo was carried on among the Samurai and several hundred forms of fencing were propagated throughout the country. At the present time, there are about 30,000 people who are taking up this sport, if we include those in the middle schools, colleges, universities, and in private life. This sport is to hold the sword with both hands and to stike the face, forearm, or torso of the adversary.

Boxing

Boxing is a Western sport which has earned phenomenal popularity in Japan during the past few years. Earlier, interest was quite negligible. The rapidity with which boxing has become popular in this country owes much to American motion pictures, which introduced it. The hero who gives the villain a black eye and finally knocks him down caught the fancy of the Japanese people, and films recording the major bouts of the past decade, including the famous Dempsy-Tunney fight, also went a long way toward creating interest in boxing here.

Boxing clubs are to be found in all leading cities of Japan. In Tokyo there are about 20 professional clubs which from time to time arrange bouts for the public. There are, of course, champions, both professional and amateur. Foreign boxers are invited to fight Japanese pugilists. Intercollegiate boxing bouts are as popular as professional bouts and draw a heavy attendance, often several thousand men and women. It is only during the past few years, however, that boxing has paid its way.

Records show that boxing was first introduced to Japan by foreign sailors in the early years of the Meiji Era (1868–1912) at Yokohama, where they landed and held a few bouts among themselves. It is also recorded that a foreign sailor had a dispute with a Japanese samurai on the street and knocked him down in the clash which followed. The first boxing club in Japan was organized in 1910 by Mr. Kenji Kano. In about 1920, American motion pictures introduced to Japan many scenes in which boxing was employed. In the meantime, Mr. Yujiro Watanabé, trained by the noted negro fighter, Turner, returned to Japan and established a club of his own to train many youths in the pugilistic game.

Japanese boxers participated in the World Olympic Games for the first time in 1928 at Amsterdam. Of the two entrants, one lost the first tussle, but Kintaro Usuda, a welterweight, won two bouts before losing in the quarter-finals. In the Tenth Olympiad, held at Los Angeles, the Japanese boxers made an insignificant showing, not one winning a single bout. In 1931, the All-Japan Professional Boxing Association was organized to control professional boxing.

The second national boxing championship tournament was held for eight days, beginning December 20, 1935, under the joint auspices of the Japan Professional Boxing Federation and the Tokyo Nichi-Nichi Shimbun. The final bouts were staged at the Kokugikan wrestling bowl, Ryogoku, on January 6, 1936, resulting in only two champions defending their title successfully.

More than 150 boxers, mostly from Tokyo, Nagoya, Kobé, Osaka and Seoul, took part. The championships were contested in five different divisions—flyweight, bantamweight, lightweight and welterweight. The participants were divided into two classes, A and B. 30 leading fighters who appeared as favourites for championship honours were seeded in A class, and all others were included in B class. The New York Commission rules were applied to the tournament.

Results of the final round, a 10-round bout each, were as follows :

Flyweight : Yoichiro Hanada (Imperial Club) defeated Isamu Ito (Imperial Club) on points.

Bantamweight : Umio Gen (Imperial Club) defeated Shoichi Otsu (Kyokuto Club) on points.

Featherweight : Sanekatsu Koike (Dai-Nippon) Knocked out Goro Takatsu (Olympic Club) in the ninth round.

Lightweight : Ichiro Mitsuyama (Imperial) won a technical Knockout over Kotaro Suzuki (Imperial), in the seventh.

Welterweight : Yoshio Natori (Tokyo) defeated Riichi Sato (Toho) on points.

Challenge bouts for three championships, flyweight, bantamweight and featherweight, over 12 rounds each, were held on September 14, 1936, and March 7, 1937, in Tokyo, and were resulted as follows :

Bantamweight—Shoichi Otsu (Kyokuto Club), 116 pounds, challenger, cap-

Wrestling (Sumo)

Japan's traditional wrestling, known in Japanese as sumo, is another ancient sport of Japan. It is recorded in ancient history that Nomi-no Sukuné and Taéma-no Kehaya wrestled before the Emperor Suinin. In feudal times each lord had under him the strongest wrestler of the province, and he made it a custom to arrange a match with the wrestler of another lord. Such being the case, the wrestler who was strong and won for his lord many laurels enjoyed warm patronage. Public estimation of wrestlers in those days was unusually high. During the Tokugawa era, which extended for nearly 300 years before the Meiji Restoration (1868), a wrestling tournament was organized, and in January and May of each year the best wrestlers of the Kwanto district (Eastern Japan) gathered for it at Ryogoku, Yédo (present Tokyo). Rankings were decided on the basis of the showing made at the tournaments, and the wrestlers exhibited great enthusiasm in their matches. This custom remains even to this day.

Until late in the Meiji Era (1868–1912), Japan had two major wrestling organizations, one in Tokyo and the other in Osaka, but later they merged into one organization. At the end of 1931, however, the Japan Wrestling Association had internal trouble. To be more precise, many wrestlers became dissatisfied with the traditional system of distribution of profits because the retired wrestlers, who acted as officials of the association, took the major part, virtually disregarding the wrestlers on the actives list. The trouble divided the wrestlers into three separate groups. In addition to the one which remains in the association, there were the Shinko and Kakushin groups. The latter two groups adopted new rules for wrestling. Of the two the Kakushin group headed by Tenryu and located in Osaka has survived outside of the traditional group in Tokyo.

The semi-annual tournaments of the Japan Wrestling Association are held at the Kokugi-kan amphitheatre at Ryogoku, Tokyo, in January and May. Each tournament lasts for 11 days. The wrestlers are all professionals, and the majority of them have unusually well-developed bodies. Victory in a typical Japanese wrestling match is a matter of a minute or two. Very often it is a matter of a few seconds. The wrestler who forces his opponent to fall or even let any part of the body above the knee touch the ground or to jump out of the ring is declared by the umpire to be the winner. It is said that there are 48 different ways of defeating an opponent. Wrestling is also practised widely in schools, as are jujitsu and fencing.

The list of principal sumo wrestlers, in May, 1939, follows:

In the order of seniority in the East camp, Futabayama (Yokozuna or Grand Champion); Maédayama (Ozeki, or Champion); Haguroyama (Sekiwake, or Champion No. 2).

In the order of seniority in the West camp, Minanogawa (Yokozuna, or Grand Champion); Kagamiiwa (Ozeki, or Champion); Nayoriiwa (Sekiwake, or Chmpion No. 3).

The winner was Futabayama.

Jujitsu (Judo)

Jujitsu, more popularly known as judo, is more a military art than a sport. In olden times, this art of self-defence was widely practised among the warriors, to whom it came next to kenjutsu, or fencing, in importance. One essential difference between wrestling and jujitsu is in the use of strength. The wrestler as a rule throws down his opponent by his own strength, but the jujitsu expert uses little of his own strength, rather taking advantage of the weight and strength of his opponent in hurling him to the floor. Action is unusually swift, and a good expert of jujitsu can easily dispose of a dozen non-jujitsumen in a fight.

This manly art of self-defence was developed to its present popularity and prosperity chiefly by the late Jigoro Kano, promoter of the Kodokan style of jujitsu and head of the Kodokan, the leading jujitsu training gymnasium in Japan. Since he established the Kodokan in 1886, he has turned out thousands of experts, and these experts in turn have popularized the art throughout the length and breadth of the land. After the Russo-Japanese War, jujitsu became popular in foreign countries, where Japanese instructors were invited to teach it. Some foreign writers became enthusiastic over the art, which they said embodied the spirit of the Japanese race, and even went the length of declaring that to it the Japanese owed in large measure their brilliant victory in the Russo-Japanese War, the first war in which an Oriental nation defeated a major Western Power.

At present jujitsu is practised in all middle schools and other higher schools in Japan for its value in physical and mental culture. Many schools have teams, and as with baseball and tennis

Rowing

This is one of the Western sports introduced to Japan early in the Meiji Era. The Tokyo Imperial University took it up first. Japan's rowing team did not fare well at the Tenth Olympic Games at Los Angeles. Lack of training and poor physical power were blamed for the defeat. The leading universities have races on the Sumida River each year.

Prior to its participation in the Berlin Olympic regatta, the Japanese Olympic crew, Tokyo Imperial University eight, caused a sensation in England when it defeated the Thames Rowing Club by a length and half in the finals of the Marlow Grand Challenge Cup race, held on the 1,540-yard course on River Thames on June 20, 1936. The Japanese crew's winning time was 4 minutes 9 seconds, a new course record. It eliminated the Cambridge Varsity crew by three-quarters of a length in the semi-finals on the same day. It was the first rowing victory by Japanese oarsmen abroad.

Later, the Tokyo Imperial University crew took part in the Henley Regatta, started on July 1, and lost to the Zurich crew in the semi-finals on July 3. The Japanese eight lose to Zurich by 6 lengths. Members of the Tokyo Imperial crew were :

Position	Names	Age	Height	Weight
Cox	Tadashi Kirishima	23	5.1 feet	96 pounds
Stroke	Tadashi Negishi	23	5.6	129
7	Katsu Kashiwabara	21	5.6	137
6	Mondo Sekigawa	22	5.9	160
5	Isamu Mita	22	5.9	140

3	Haruyoshi Nakagawa	23	5.7	143
2	Takeo Hori	22	5.6	132
Bow	Yoshiteru Suzuki	24	5.5	130
	Average height		5.6 feet	
	Average weight		134 pounds	
	Coach		Mr. Shuhei Seta	

The national eight-oared championship meet (2,000 metres) was held on the Ogu course on the River Ara, near Tokyo, on September 24, 1938, the Waseda University, the Tokyo Imperial University, the Dōshisha Commercial College, the Tokyo Commercial College and the Keio University crews taking part. The Tokyo Commercial College team in 6 minutes 10 seconds won the championship, beating the Keio University eight by a half length.

The winners in this annual championship meet follow.

1934 Keio University
1935 Waseda University
1936 Tokyo University of Commerce
1937 Tokyo Imperial University
1938 Tokyo Commercial College

Horsemanship

Japan's horsemanship won international recognition at the Tenth Olympiad at Los Angeles when Lieutenant Baron Takeichi Nishi, of the Japanese Army, won the Prix des Nations and had the flag of the Rising Sun hoisted. Horsemanship was widely practised by the warriors of the feudal period as a military art. The Japanese army attaches importance to horsemanship and takes great pains in training officers and men. Horsemanship is also gaining popularity among college students and even women. There are at present about 15 clubs in large cities, and many universities and colleges have their own riding societies. Horse racing regained popularity with the use of pari-mutual tickets under strict restrictions in 1923. The Government encourages racing by granting aids. There are more than a score of race clubs throughout the country, most of the races being held semi-annually, that is in the spring and autumn.

Golf

Once a pastime of the wealthy, golf is beginning to become popular with the opening of public courses. Clubs are to be found in practically all large cities and their environs. A group of Japanese golfers visited the United States in 1932 and participated in national and State tournaments. Although they failed to win any title, they made impressive records. The list of golf links follow :

Toda beat Inoue on the Takarazuka course on September 15.

Skiing and Skating

Introduced here only a decade or so ago, skiing has become extremely popular. Japan abounds in good grounds in the northern districts, which accounts for the rapid strides skiing has made. Numerous women are taking to it of recent years. In 1929, Hannes Schneider, prominent Austrian skiier, visited Japan and exhibited his technique at various skiing slopes at Akakura, Myoko, etc., making a great impression among Japan's ski lovers.

Skating is an older game than skiing in this country. As a sport for the general public, an exhibition was first given about 1907 on Lake Suwa, in Nagano prefecture. The All-Japan Skating Championship Meet for speed skating, figure skating and ice hockey is held there yearly. At Nikko, a rink of tremendous size was laid in the winter of 1932 to permit the public to enjoy the pastime. In 1934, Japan invited Miss Bruger, the figure skater and the Canadian Ice Hockey Team. She sent 11 skiiers, 7 speed skaters, 3 figure skaters, 15 ice hockey players, and 13 officials who all participated actively in the 11th Olympiad at Gürmisch. A list of important ski grounds follows :

CHAPTER XXXVII

AMUSEMENTS AND CALENDAR OF ANNUAL EVENTS

Amusements

The Drama

Japan has a drama all her own. The popular stage is the "kabuki", essentially a product of past ages, which, with its enchanting beauty and gorgeous colour, often captivates the fancy of foreign visitors. The kabuki drama is not old as age goes in Japan. It sprang spontaneously from the people, the tradesmen, the artisans and others who were excluded from the pleasures enjoyed by the aristocrats and samurai in olden days; but its forbears may be recognized in the stage art of Japan prior to its birth.

The Origin The religious dance that was the precursor of drama goes back through centuries to the mythological age of the gods, when the great Sun Goddess, offended by her brother, retired to a deep cavern, casting the world into darkness. After trying in vain to entice her from her retreat, the other gods finally hit upon the scheme of flashing a metal mirror into the cave and of jumping and shrieking before its mouth, whereupon the Sun Goddess came forth, the mouth of the cave was sealed, light was restored to the world and the dance was added to civilization.

For centuries the dance remained, as in other countries, a religious rite, being performed in Shinto shrines by virgins. With the incoming of Chinese culture Chinese music came into favour and was introduced into the Imperial Court. At the time of the establishment of the first Shogunate, that at Kamakura in the 13th century, the Buddhist semi-dances and semi-drama made a great appeal to the warrior class, and from them was evolved the "no" drama, in which both actor and playwright are subservient to interpretation. The No is a combination of music, posturing and dialogue, severely bound by conventions, with but little action, appealing to the ear and intellect rather than to the eye. The No found warm patronage among the warriors and feudal lords, continuing to hold its own with them until the Meiji Restoration, when it was identified with the then unpopular Shogunate and suffered a decline which has only recently been mitigated.

But the common people had no part in either the religious or the No dances, not even appearing as spectators. These were the exclusive prerogative of the upper classes.

Popular Stage Appears It was during the early part of the long Tokugawa Shogunate that the popular stage in Japan came to birth, flowered and bore fruit. An era of peace was ushered in, and the Empire began to prosper in a material way. Not only the kabuki, but the ukiyoyé, or woodblock colour print, and other genre date from this period. The people had leisure, money and the inclination for pleasure. It was but natural that forms for providing that pleasure should follow.

The germs of the popular drama may be found in society prior to this period, but they had not attained much development. About 370 years before, one of the Shinto shrine dancers, O-Kuni, performed on a public street in the capital city of Kyoto, after which she wandered from place to place for the entertainment of the people. Others followed her lead, until the government decreed that thereafter only men might give public entertainments, owing to the moral laxity which had ensued. The name kabuki was first applied to this pioneer form of dancing. Although the Chinese ideographs forming the word mean literally "singing and dancing art," Japanese scholars say that its true derivation is from an obsolete Japanese verb meaning "to be playful."

The Kabuki The early kabuki actors were social outcasts, or kawara-mono (river-bed folks), but as the aristocracy learned of the new art and its charms they secretly slipped away from their palaces and homes to enjoy it. Gradually, as in other nations, the moral and social level of the stage was raised, until today there is no more social prejudice against the actor in Japan than in America or Europe. The late Emperor Meiji's attendance of a performance by a troupe of kabuki actors at the home of the late Marquis K. Inoué improved

dom, if ever, are long runs given, no matter how popular a particular programme may prove, although the pieces which prove popular are repeated from time to time as long as they hold public interest.

The Typical Programme A typical kabuki programme has three to five offerings of different types and lasts six hours, beginning at 4 o'clock in the afternoon and ending at 10 o'clock. The majority of the spectators take dinner in restaurants in the theatre during intervals. Tickets cost from 50 sen to as much as ¥7 or ¥8 a seat. All the playhouses are of Western style, at least inside, with chairs provided. Seats may be reserved 10 days in advance.

It is wrong to assume that Japanese actors specialize in producing classics alone. From time to time they insert modern plays between those of bygone generations on the programmes. In the past they have even staged plays from Shakespeare with marked success. Some actors specialize in modern plays, such as Masao Inouyé, Takéo Kawai, Rokuro Kitamura and they appear with actresses, such as Yaéko Mizutani, as the latter are essential for the realistic type of plays, plays which are true to life and without the incongruity and exaggeration which characterize the kabuki.

A "little theatre" movement in Japan was started about 15 years ago, led by the late Kaoru Osanai, prominent dramatist and stage director. The group which performed at the Tsukiji Little Theatre, Tokyo, produced hundreds of Western plays in Japanese translation, but their performances aroused the interest of only a limited section of the intellectuals. The unexpected death of Mr. Osanai and the business depression that followed dealt a crushing blow to the movement and the company split up into small and unimportant groups.

The Revue The revue, a product of the West, is quite in vogue at present in Japan. Imported only a few years ago, it appealed to modern-minded youth, and several revue organizations sprang up. The largest troupe is that of the Shochiku Theatrical Company, with several hundred girls. Another influential organization is the Takarazuka Girls' Opera Troupe, with headquarters at Takarazuka, a hot-spring resort between Osaka and Kobé. It enjoys the distinction of being the oldest in Japan, having been organized nearly two decades ago. The performances of the latter group include operas and revues and are generally more refined than those of the Shochiku Troupe, and they find warm patronage among young girls. Costumes and scenery in the revues are both Japanese and foreign. The Shochiku group gives occasional performances in Tokyo and Osaka, and the Takarazuka organization set up a new Tokyo Takarazuka Theatre in 1933 at Hibiya, Tokyo.

The Odori Differing entirely from this type of foreign-style performances is the "odori", or Japanese dance, as given by the geisha, the native dancing girls. Kyoto, the ancient capital, boasts the best organization, which gives the "Miyako Odori" each April, better known to foreigners as the Cherry Dance of Kyoto. In Tokyo, the "Azuma Odori" (dance of eastern capital) is given at cherry-blossom time by the geisha of the Shimbashi district of the city, who also perform in the autumn, always in their own theatre, the Shimbashi Embujo, which is of Western style. Geisha dances can be enjoyed at private parties at any time of the year.

No Drama

The No drama was as aristocratic as the kabuki drama was plebeian, and even now its performance and enjoyment are practically restricted to the upper classes. There are very few theatres or private houses, if any, where strangers are allowed to view No upon payment of admission. Most No enthusiasts form clubs, and members and their friends see the productions. In feudal Japan, the No was the principal form of entertainment among the aristocrats and the warrior class. It was often given in the presence of the Emperor, and at one time it was the custom to invite the common people to performances given in commemoration of some happy event by the Tokugawa Shoguns, who used the No on all ceremonial occasions.

The Origin and Stage The origin of the No dates back to the early part of the 15th century. Two men, Kiyotsugu Kan-nami and his son, Motokiyo Séami, revolutionized the "Saru-gaku", an ancient form of dance, consisting of juggling feats and comic remarks with actions to suit, with the result that the No in its present form was developed. Not only did these two men build on what was best in their own saru-gaku, but they drew freely from the "dengaku", ancient music, which had much in common with the saru-gaku. What was graceful in them was ennobled to profundity in the No, while their comic elements developed into the "kyogen", comic performances, usually given on the same programme with No pieces.

Digitized by Google

their status immeasurably.

The introduction of the samisen, or three-stringed guitar, into Japan from the Loochoo Islands constitutes another high-water mark for the drama, for in time the musical compositions for the No were adapted to this instrument of the streets, and there followed the puppet show, which has survived to this day. These marionette theatres called to their aid some of the best talent in the country, musicians, playwrights and puppet manipulators collaborating in the work. The kabuki emerged from the street dancing and the puppet show and yet as a separate and distinct art of a high order.

The kabuki is found to embrace four general classifications : historical dramas, plays of everyday life, fantastic, imaginative improvisations, and music-posture plays or dances. It is often difficult, however, to assign any particular drama to one of these four classifications, for the play with historical characters may also be a play dealing with their very human emotions.

The Technique The drama is primarily a picture for the eye, although dialogue is carried on and an orchestra-chorus seated on the stage plays very much the same rôle as was played by the chorus in classical Greek drama, aiding the action with explanations to the audience. The life and thought, costumes and manners of all classes of feudal society are well illustrated on the kabuki stage, while skilful colour combinations in costumes, stage architecture and furniture tend to carry the spectators into a land of imagination and romance. In dramatic ability it takes rank with that of any country. In stage settings and mechanics it has much to teach the rest of the world. Its gorgeousness of costuming and pageantry finds no equal. One of the features of the Japanese theatre is the hana michi, or flowery way, which usually consists of two long narrow platforms on the same level which stretch through the audience from the stage to the rear of the auditorium. They are chosen by the actors for their best entrances and exists and are extremely effective when processions are used.

The Kabuki Actors The profession of kabuki actors is in most cases hereditary. Sons of actors succeed their fathers in the profession, and actors without sons usually adopt the sons of other actors or their best disciples and give them the stage names of their families. Kikugoro Onoyé, one of the most accomplished actors, is the sixth Kikugoro Onoyé, while the late Danjuro Ichikawa represented the ninth generation of the Ichikawa family. Kabuki actors are trained from childhood and because of the difficult conventions to which they must conform few men can become actors after the age of 20.

In kabuki proper, all rôles are taken by men. The onnagata, or woman impersonators, devote years of study to femininity, and in most cases they are more consistently feminine than women.

In comparison with screen actors, kabuki actors are very well paid. Though the matter of salaries is kept a strict secret, it is well known that a high-class kabuki actor is given more than ¥10,000 a month, but in cinema circles very few actors obtain as much as ¥1,000. Stage actors are also held in much higher esteem by the general public than screen actors. They still live and work according to the family system. A high-class actor has a troupe, all the members of which are his disciples. Only the head of the troupe receives wages directly from the theatre, and he in turn divides the money among his disciples. Other feudal customs also survive among them.

Tokyo is the dramatic centre of the country. Practically all first-class kabuki actors live here, though there are a few in Osaka. They travel all over the country from time to time. The more noted ones in Tokyo are Utayemon Nakamura, Uzayémon Ichimura, Kikugoro Onoyé, Sadanji Ichikawa, Koshiro Matsumoto, Kichiyémon Nakamura, Sojuro Sawamura, Ennosuké Ichikawa and Mitsugoro Bando. The noted Osaka actors include Enjaku Jitsukawa, Fukusuké Nakamura and Kaisha Nakamura.

On the business side, kabuki is controlled entirely by a single commercial organization, the Shochiku Theatrical Company. This company not only has all the first-class actors under contract but owns or leases all of the principal playhouses throughout the country. The largest and most famous theatre is the Kabuki Theatre, commonly known as the Kabuki-za, situated back of the Ginza, Tokyo. Other well-known theatres in the capital are the Tokyo Theatre, Meiji-za, Shin Kabuki-za and Shimbashi Embujo. The Imperial Theatre, which once earned fame as a modern playhouse, has been converted into a cinema house. Osaka has the Naka-za and Naniwa-za, where Kabuki programmes are given practically throughout the year. The theatres change programmes once a month, and very sel-

In Tokyo, the "Azuma Odori" (dance of eastern capital) is given at cherry-blossom time by the geisha of the Shimbashi district of the city, who also perform in the autumn, always in their own theatre, the Shimbashi Embujo, which is of Western style. Geisha dances can be enjoyed at private parties at any time of the year.

No Drama

The No drama was as aristocratic as the kabuki drama was plebeian, and even now its performance and enjoyment are practically restricted to the upper classes. There are very few theatres or private houses, if any, where strangers are allowed to view No upon payment of admission. Most No enthusiasts form clubs, and members and their friends see the productions. In feudal Japan, the No was the principal form of entertainment among the aristocrats and the warrior class. It was often given in the presence of the Emperor, and at one time it was the custom to invite the common people to performances given in commemoration of some happy event by the Tokugawa Shoguns, who used the No on all ceremonial occasions.

The Origin and Stage The origin of the No dates back to the early part of the 15th century. Two men, Kiyotsugu Kan-nami and his son, Motokiyo Séami, revolutionized the "Saru-gaku", an ancient form of dance, consisting of juggling feats and comic remarks with actions to suit, with the result that the No in its present form was developed. Not only did these two men build on what was best in their own saru-gaku, but they drew freely from the "dengaku", ancient music, which had much in common with the saru-gaku. What was graceful in them was ennobled to profundity in the No, while their comic elements developed into the "kyogen", comic performances, usually given on the same programme with No pieces.

Digitized by Google

Unlike any other form of drama, the No is performed on a wooden stage of regulation size, built above the ground, 18 feet square, open on three sides, with a narrow extension on one side for the singers and another at the back of the stage for the musicians and attendants. To that rear extension is attached aslant a passage called a bridge. The players appear from under the curtain, to one end of which the passage slightly slopes down. The stage, too, is very slightly tilted to the front.

The No pieces, numbering more than 250, are repeated over and over again, but the interest of the spectators apparently never wanes. The pieces are classified into five groups for convenience: (1) "wakino", which generally deal with Shinto or Buddhist deities; (2) "shuramono", which commonly deal with ghosts of warriors; (3) "kazuramono", with noble ladies acting the main parts; (4) "genzaimono", or present-day pieces, dealing with various manifestations of human nature; (5) pieces dealing with demons or goblins as subjects, or those of congratulatory nature with gay and joyous elements.

For each programme of the No, which generally lasts a good part of a day, one from each of the above five classes is given in the order mentioned, with a "kyogen" between each and generally a dance in ordinary dress in addition. The whole programme is preceded by a piece called "okina", which is held in special reverence; the person acting its chief character is the okina, an old man.

The Construction The construction of the No piece is by no means uniform, but very often it is as follows: A "waki," who plays the secondary rôle, generally a monk or a Minister of State, first appears and tells who he is. Then he walks about the stage a while, singing, to suggest that he is travelling. Coming to a standstill, he announces his arrival at a certain famous spot and takes his place by the post at the front righthand corner facing the stage. Then the "mayé jité" (shité), the principal character in the first appearance, comes in the form of a farmer, fisherman or priest, describing the scenery of the place and telling of heroes connected with it, or relating the origin of the temple or shrine as the case may require, thus furnishing the audience with a necessary background to the play. The "mayé jité" then suddenly retires from view. He was in reality a Shinto or Buddhist deity, or the ghost of a warrior, in disguise. While the "waki" is startled by this sudden disappearance, there come on the stage common farmers or wood-choppers who give in plain language, spoken more or less in the ordinary way, all detailed information concerning the place, generally reiterating what has alreary been chanted or intoned by the "mayé jité," and then retire. This allows necessary time for the principal character to change for his reappearance. While waiting, the "waki sings," indicating a lapse of time. The song ended, the "nochi jité," the principal character in the latter appearance, in proper form and attire as a Shinto or Buddhist deity or the spirit of a hero, comes to the stage and dances as though wandering at night, revealing some spiritual attributes. In words and in action he recounts his bravery, his death struggle, or his suffering in the underworld, asking for the prayer of the "waki" for the peaceful repose of his soul. The "shité" tells his story as he performs, or he merely dances without any chanting. Generally there is a chorus who intone some verses either alone or with the performers. In the No drama, the action is symbolic, stately and ennobling.

Generally several persons sitting on the side extension sing either in chorus, by themselves, or together with the performer. On the rear extension there are usually four musicians who play on the "fué" or flute, the tsuzumi, which is a small drum struck with the tips of the fingers and resting on the shoulder, the ohkawa, a slightly larger drum struck on the knee also with the tips of the fingers, and the drum beaten with two sticks.

The accessories used on the stage in connection with the play are very simple. A fan is much in evidence in the dance, the studied use of which is very effective with the manipulation of the dancer's big sleeves. The costumes used in the No are marvels of textile fabrics, refined taste being revealed in bold yet harmonious designs and colours. Above all, the mask to be worn by the principal character and the assistant is a very important part of the No performance. There have been great masters among carvers of No masks in his feudal Japan many of whose works still remain.

Six Schools Ever since the great reformation at the beginning of the 15th century, the No has had four main acknowledged schools or houses: Kwanzé, Komparu, Hosho and Kongo, all of which are still thriving. Later, another school, Kita, won official recognition, while still another, Uméwaka, also has

Digitized by Google

many followers, the variation practiced by each school being but slight. On the whole, the No performance may well be compared to a masterful Oriental picture in monochrome, both being guided by highly idealistic aims and artistic aspirations with many points in common, possessing alike great impelling qualities that thrill the devotee but sometimes weary the uninitiated.

The Doll Theatre and Joruri

Japan's doll theatre, the precursor of the kabuki drama, has suffered so much decadence that now the Bunraku-za in Osaka is the only doll troupe of its kind in the country. The plays are kabuki in miniature. Each doll, slightly smaller than life-size, is held by a manipulator on the stage and made to act. The manipulators, who appear in ceremonial robes, put life and spirit into the wooden figures, and they have world fame for their dexterity.

The "joruri (Gidayu)", a dramatic recitation, is not only inseparable from the doll show, but enhances its effect. The joruri reciter usually sits on a raised platform at the right corner of the stage and there sings and recites to the accompaniment of the samisen, the player of which sits beside him. Not seldom several reciters and samisen players perform in unison, the reciters speaking their lines for the dolls. Both manipulators and singers are trained from childhood. The joruri recital often accompanies the kabuki performance. The joruri or Gidayu is also sometimes recited independently of the doll show or the kabuki.

Yosé, or Story-Telling

Professional story-telling is a distinct Japanese art, which, defying the advent of the movies, still survives in Tokyo and elsewhere. When there were no movies, story-telling was one of the few common forms of amusement. The houses where the story-tellers perform are called yosé, and are a sort of variety hall, where singing, juggling, dancing and other entertainments are offered in addition to story-telling.

Today a score of story-tellers' halls can still be found in Tokyo. Unlike theatres for the drama and the cinema, they are usually Japanese-style frame houses, with quite modest advertisements covering their fronts. Inside, a yosé consists of one large mat-floored room, with a small mat-floored stage attached. All the guests sit on cushions spread on the matting, and the performers sit on the matting of the stage. Usually the house has a balcony with more expensive seats.

The majority of the story-tellers, who are called hanashika, specialize in comic monologue. Those who specialize in stories of heroism and adventure are called koshakushi, or romance readers, and regarded as of a different class. The hanashika use a lot of punning, irony and sarcasm, and each story has a twist at the end. Translated into English, their talk loses almost all meaning, for it is the manner of telling that is important.

Cha-no-Yu

Japanese people drink tea during and after each meal and it is customary to serve a cup of tea to callers at any time of the day. Cha-no-yu or tea-ceremony is, however, a peculiarly artistic way of serving tea as an entertainment for guests according to strictly-formulated rules of etiquette. A fine powder of choice green tea is used for it. The powdered tea is put in a bowl much larger than an ordinary tea cup and hot water is poured over it, and the mixture is beaten by means of a bamboo whisk. A party of guests are invited to enjoy this drink. They assemble in the "yoritsuki," a special waiting room for the tea party. The host appears and conducts them to the tea-room. They walk along a garden path to the tea-room, which is about 20 feet away. At a basin filled with fresh water they wash their hands before entering the tea-room. This is usually four and a half mats in area, about three metres square, and is provided with a stationary hearth or portable firebrazier for the kettle. The entrance to the tea-room is so small that the guests have to stoop to enter.

On entering the room each guest kneels in front of the tokonoma or alcove, and admires the kakémono or hanging picture or inscription on the wall of the alcove, and the tiny incense-holder on a side shelf. Then a meal is served as soon as the guests are properly seated. It is called "kaiséki" and is of the simplest dishes. The host waits on them himself not eating with the guests. After the "kaiséki" sweets are served, the first part of the ceremony is concluded.

Then at the host's suggestion the guests retire to the waiting-room or to another place where a bench is provided. A gong announces that the host is ready to serve the tea above mentioned. The formality of purification at the basin is repeated and the guests enter the room. The hanging scroll is gone and a flower arranged in a

cinema theatres in Japan was as follows:

Presentation of	Japanese films	1,257
,,	,, foreign films	50
,,	,, newsreels	32
,,	,, mixed films	213
Total		1,552

In 1937 paid audiences at the permanent picture theatres in Japan numbered more than 200,000,000 and this number is on the increase. The government institutions, schools, newspaper companies, and the like, are giving free shows for purposes of propaganda, education and entertainment. Thus, the utilization of movies has been increasing year by year; 50 thousand free shows were given in 1937. Of the permanent theatres those showing cultural and news films in February, 1938, represented something like 60 per cent of the total; and they are also constantly increasing in numbber.

Home and Imported Films According to the report of the Police Bureau, Home Ministry, the number of new films inspected by the Bureau in 1937 was 41,560 with an aggregate length of 25,684,000 metres.

HOME AND IMPORTED FILMS INSPECTED in 1937

	No. of New films	Aggregate Length (In metres)
Japanese films	37,303	21,779,000
American films	3,288	2,881,000
European films	969	1,018,000
Total	41,560	25,684,000

The largest and most influential motion picture producing and distributing companies in Japan are the Shochiku Cinematograph Company, Ltd., Shinko Eiga Company, Ltd., and Japan Motion Picture Company, Ltd., the last being better known as Nikkatsu for short. Shochiku manages or supplies with pictures about 600 theatres, or nearly half of the total in Japan, and all the rest are either managed or supplied with pictures by the other two and by foreign, especially American, companies. Japanese pictures in general are produced by distributing companies.

With regard to imported films, the number of those distributed in 1937 were approximately 800, of which long fiction films were about 300. However, in consequence of the restrictions put upon imports following the outbreak of the present Affair, the number decreased to 144 in 1938. Of these, films from America were 103, from France 10, from Germany 13, from England 12, from Italy 3, from Poland 1, from Spain 1, and from other countries 1.

The distribution of the American films is made directly by American companies through their branches in Japan. The number of American films distributed in 1938 classified according to the producers was as follows; the Paramount 10, the Metropolitan 16, the Universal 6, the R.K.O. 18, the Columbia 20, the United 8, Warner 7, and the Fox 9. The distribution of European films is made by Japanese agents, such as the Towa Commercial and the Sanei Companies. As compared with those from America, pictures from Europe are insignificant in number. Owing, however, to the Japanese German and Japanese-Italian Cultural Agreements and to the Commercial Agreement between Germany and Manchoukuo, it is quite likely that in the future a considerable number of German and Italian films will be imported to Japan.

Cinema in 1937-38 Increased importance of the cinema. With the increased importance of Japan's position in international political affairs with the conclusion of the German-Japanese Anti-Comintern pact as its turning point, the need has been felt of introducing anew to overseas countries life as it really is in Japan. This is due not only to a desire on the part of Japan to make herself better understood abroad, but is also attributable to the increasing desire among oversea peoples to acquire a sounder knowledge of present-day Japan. The first picture produced to fill this need was Dr. Arnold Fanck's "New Earth", of which an English and a German version were made and exported to America and Europe. This was followed by "Picturesque Japan", produced with the aid of Tsuguji Fujita, the noted painter, and "Glimpses of New Japan" by Shigéyoshi Suzuki. The former was a highly artistic production, but because it was unconventional both in technique and the subjects treated, the picture was criticized as conveying an inadequate impression of Japan. It was, nevertheless, passed unanimously by the examining committee and exported as a valuable artistic contribution. It may be said that the exportation of artistic Japanese films such as "Picturesque Japan" is significant of the general

ly indebted to tea-masters and devotees for its high taste.

Flower Arrangement

Japanese flower arrangement is the art of arranging flowers and leaves in different kinds of vases so as to meet the requirements of Japanese taste in decorating their sitting rooms and parlours. The raison d'être of this Japanese floral art is the satisfaction of their instinctive love of naure by a scheme of decoration best fitted for Japanese interval architecture. The beginning and development of Japanese flower arrangement, therefore naturally corresponds to the history of Japanese architecture and way of living.

The Japanese style of architecture which had completely emerged from the Chinese influence in the 14th century, and the comparatively peaceful life of the people in the 14th century under the Ashikaga régime, prepared favourable conditions for the development of flower arrangement which played an important part in enriching the tasteful life of the upper classes of people such as Court nobles, warrior lords and monks.

The Ginkakuji Temple or Silver Pavilion, which was built in the latter half of the 15th century, in the outskirts of Kyoto, is said to have been the birthplace of Japanese flower arrangement as an art, as well as that of the tea ceremony. The Ashikaga Shogun Yoshimasa who lived at the Ginkakuji had several attendants, "chabōzu" or "tea-priests" who looked after the tea ceremony and flower arrangement for him. Among these attendants of Yoshimasa the one who was best versed in the art of flower arrangement was Sōami. One of the oldest documents on the floral art "Gojō Shikimoku" is attributed to his authorship, and it is most likely that the primitive flower arrangement which had been already in vogue took a definite shape with Sōami and schools of the art began to be established. After Sōami came Ikénobō priest of a temple called Rokkakudo, also located in Kyoto, who later so distinguished himself as priest and master of flower arrangement that he became the founder of the priesthood at Rokkakudō and the school of floral art, both bearing his name. The Ikénobō school of floral art has existed for more than four hundred years and is proud of having the longest tradition and probably the largest number of students throughout the country.

During the 17th century the Emperor Gomizunowo took great interest in the floral art and courtiers, nobles and high officials gathered together at court for the study and occasional exhibitions of flower arrangement. A hall was provided in the court for the tea ceremony to which guests were invited and an exhibition of flowers arranged in vases by different hands was often held for them in a building which was temporarily built for that purpose in the palace garden. Such exhibitions of flower arrangement were held frequently during the following centuries.

There have developed many schools of flower arrangement in Japan during the past four centuries, but they may be roughly grouped into two; one is the "rikkwa" group which is more formal in style and the other is the "nagéiré" group which is more natural. The former was in the past regarded as the orthodox style whereas the latter was considered heretic or auxiliary. But to-day both styles have equal standing among the students of the art, each having characteristic merits and uses of its own.

In Japan girls are taught the floral art in schools and under private tutors as one of the accomplishments for ladies and carefully keep their certificates of the art in the "tansu" or Japanese chest-of-drawers for keeping kimono, one of the indispensable pieces of furniture which they take to their new home at their wedding. Japanese ladies find occasions for escaping from their household duties and chatting with their friends in attending flower arrangement parties, for as a rule they rarely go out for picnics or to dances. Men, young and old, occasionally take up the study of the floral art, and though they are much fewer in number than the other sex they occupy the position of leadership in almost all schools of the art. It is no longer a monopoly of the aristocracy, and visitors to Japanese homes are charmed with the sight of flowers and leaves artificially yet most naturally arranged in vases put on the "tokonoma" or alcove shelves. On festival days passers-by are entertained by exhibitions of flowers most skilfully arranged and set in rows in the front rooms of houses facing the street. Modern department stores attract customers with special flower arrangement exhibitions.

The Cinema

Cinema theatres are to be found in all parts of Japan, both in cities or hamlets, accommodating from 400 to 3,000 persons. According to the statistics taken on July 22, 1938, the number of

Digitized by Google

and descriptive accounts of athletic events.

Very little amusement is given in the daytime. The first radio entertainment of the day starts at 12:05 o'clock in the afternoon. It is usually in a lighter vein and may be Japanese or foreign music or a drama. If there is a major athletic event in the afternoon, a descriptive account usually goes on the air. After this there will be no entertainment of any kind, except on Sundays, until 8 o'clock, when the principal amusement programme begins. Frequently, however, the children's programme, given at 6:30 o'clock for 30 minutes, has fairly good entertainment. From 8 to 9:30 o'clock entertainment of all sorts is offered. Very rarely does the programme extend beyond 10 o'clock.

Programme and Listeners The Japan Radio Broadcasting Association distributed 1,233,906 sheets of enquiries to its subscribers all over Japan in 1932, out of which 358,039 answers came, and a résumé of the investigation was given out in April, 1934. In the questionnaire there was a column in which the listeners were requested to state what item or items of the programme they most liked and the answers given in percentage were as follows :

Item of Programme	Percentage of Listeners
News and reports	
General news	91.2
Time signal	77.5
Weather forecast	75.8
Radio gymnastics	48.0
Public announcements	42.3
Daily menues	31.0
Industrial news	30.8
Commodity prices	27.8
Stock-market news	23.2
Employment agency	11.0
New cocoon price	8.2
Exposition of current topics	29.4
Educational	
General and moral	28.1
Literature, arts, etc.	22.3
Physical education and hygiene	22.0
The home and women	20.7
Science	13.0
Foreign languages	9.9
Amusements	
Comic stories	57.6
Naniwa-bushi (mostly tragic stories)	57.5
Radio dramas	51.2
Movie picture dramas and stories	49.3
Samurai stories	48.0
Kabuki	43.4
Biwa (Story chanted with biwa music)	39.6
Gidayu	33.4
Foreign and Japanese music combined	33.4
Japanese harp, bamboo flute, and samisen	30.0
Nagauta (long chanting)	28.3
Modern Japanese music	24.4
Opera	24.2
Brass music	22.6
Orchestra	22.6
Vocal solos	22.0
Short songs (utazawa and kouta)	22.0
Shinnai (a kind of jōruri)	20.2
Kiyomoto	19.0
Piano, violin solos and duets	18.7
Tokiwazu (a branch of joruri)	18.6
Chorus	17.6
Jazz	17.3
Yokyoku, kyogen (the No)	14.5
Old Yedo music	8.5
Young folk's hours	
Nursery rhymes	60.1
Short songs	57.0
Dramas for the young folks	52.5
Music	51.5
Stories	49.0

(For the latest development of broadcasting see Chapter XXIV Communications, Radio.)

Horse Racing

It was after the Russo-Japanese War that the import of thoroughbred studhorses and horse racing began to be encouraged for the improvement of horses in Japan. As the result a craze for horse racing suddenly set in. At that time pari-mutuel tickets were sold at ¥5, and unlimited dividends and sweeps were allowed. The result was that many people became bankrupt and abuses were too apparent, so that in 1909 horse races at which pari-mutuel tickets were sold were prohibited. But it soon became evident again that the decline of horse racing had an adverse effect on the improvement and propagation of horses in the country. Ten years later, the Horse Race Bill passed through Parliament and became law in 1923. The law fixed the price of pari-mutuel ticket at ¥20 a sheet, payment being made on wins only, not on places. The number of pari-mutuel tickets a person may buy was limited to one

Digitized by Google

recognition of the importance of the cinema.

Recent progress in Japanese motion picture enterprises, particularly in the production of pictures is shown by the fact that of the raw films consumed in 1937, negatives totalled approximately 6,000,000 metres and positives 24,000,000 metres and that the number of major studios is 18 with more than 5,000 regular employees, including actors and actresses.

The enterprises are mostly in the hands of the Shochiku, Nippon Katsudo, Shinko Cinema and other five major motion pictures companies, capitalized totally at ¥63,471,250, and they are engaged mainly in producing so-called show-pictures, such as fiction and dramatic pictures. The recently enacted Motion Picture Law will further stimulate activities along this line.

What has made enormous strides during these two years of the China Affair, however, is the production of newsreels, which is exclusively undertaken by the Asahi, Nichinichi and Yomiuri, leading Japanese dailies, and the Domei, the most important news agency in Japan. The number of reels produced in this field during 1938 amounted to 554, of which 386 were talkies, 127 explanatory films (so-called neo-super talkies), 16 sound films (recording of music only), and 25 non-talking films.

1938 Amusement in Tokyo The year 1938 showed a golden age in the amusement field. According to the statistics recently taken by the Metropolitan Police Board of Tokyo, the total entrance to the movie houses, yosé houses and other amusement places in Tokyo numbered 86,598,627. This number showed a surprising increase of 31,079,440 or 60% as compared with 1937.

Above all the entrance to cinema houses numbered 71,304,484, a sudden increase of 66 per cent as compared with 42,913,055 in 1937. The next was the entrance to yosé houses which numbered 4,534,690, an increase of 50 per cent over the previous year.

This is due no doubt to the attraction of news pictures on the China Affair. But contrary to the general prosperity in the amusement field, the number of Kamishibai or illustrated story-tellers on the street only greatly decreased, numbering about 1,000 against 5,000 in 1937. This is because that the story-tellers of Kamishibai have changed their business to factory workers which promised them a greater income.

Radio

Introduced in 1925, the radio has become one of the two most popular means of amusement in Japan, the other being the cinema. In February, 1938 more than 3,503,000 families in Japan proper had already become radio subscribers which means that one home in every 5 has a receiving set. Programmes broadcasted by the 25 broadcasting stations scattered throughout the country are diverse, including weather reports, market reports, news and lectures. Entertainment is naturally the most popular.

Complex Programmes It is said that Japanese radio programmes are more complex than those anywhere else in the world. Japan does not have a single and uniform culture; the old and the modern exist side by side, the indigenous and the foreign. Programmes, in consequence, must be arranged to meet divergent tastes, though ingenuity is sometimes taxed to satisfy everyone daily. The principal cleavage is in music. Japanese music, both instrumental and vocal, has developed in many varieties through many centuries. Just as in foreign countries different listeners have preferences for classical songs, or violin solos, or orchestral music, or popular songs, or dance music, or chamber music, so in Japan there are preferences for particular kinds of Japanese music. On the other hand, the music introduced from Europe and America is fast becoming popular. Young people who understand it generally prefer Western music, and old people, who do not understand it, would rather hear the music they have known since childhood. The ideal programme, therefore, must combine them. If 30 minutes are given to music by the New Symphony Orchestra of Tokyo, 30 minutes must also be given to music that is purely Japanese. Statistics show that station JOAK in Tokyo broadcast a total of 227 items from April to December, 1933, classified as: orchestral music, 56; vocal solos and chorus, 50; brass music, 30; chamber music, 13; violin solos, 9; piano solos, 20; jazz music, 9; foreign and Japanese music combined, 15; 'cello music, 3; flute solos, 3; pipe organ music, 2; guitar solos, 1; trumpet solo, 1; trombone solo, 1; xylophone solo, 1; and opera, 5.

Japanese Entertainment Purely Japanese entertainment is very varied. It includes singing of all kinds, from the nagauta, kiyomoto, naniwa-bushi and tokiwazu to all sorts of folk-songs, radio drama, story-telling, romance reading

Digitized by Google

are shared in by the ladies.

Children's Sports The sports of Japanese children include kite-flying, top-spinning, battledoor and shuttlecock, making snow-men, playing with dolls, etc. The large, grotesquely coloured papier-mâché dogs given to babies owe their origin to some idea of the dog as a faithful protector, especially against onslaughts by evil spirits.

Shogi Japanese chess (shogi) was introduced from China centuries ago; and though it has diverged to some extent from its prototype, the two games still have a feature in common distinguishing them from all other varieties. It is this. The rank on which the pawns are usually posted is occupied by only two pieces, called hisha and kaku by the Japanese. Also, on either side of the king are two pieces, called kin in Japanese. These perform the duty imposed on th ferz or visir of the Persian Shatranj, which was the equivalent of the modern queen. Therefore, no queen or piece of similar attributes appears eiher in Japanese or Chinese chess. There are eighty-one squares on the Japanese board, and the game is played with twenty pieces on each side, distinguished, not by shape or colour, but by the ideographs upon them. Though the movements of the pieces resemble in most respects those followed in the European game, there are certain ramifications unknown to the latter. The most important of these are the employment of the pieces captured from the adversary to strengthen one's own game, and the comparative facility with which the minor pieces can attain to higher ranks.

Chess is understood by all classes in Japan. The very coolies at the corners of the streets improvise out of almost anything around them materials with which to play, and thus while away the tedium of waiting for employment. But it is comparatively little patronized by the educated classes, who hold its rival "go" in much higher esteem. O is the king, keima the knight, hisha the rook, and kaku the bishop—or pieces having movements like them. Fu is the pawn. The movements of the yari also resemble those of the rook, but are confined to the single rank on which it stands. Gin (silver) and kin (gold) are not found in Western chess. Gin moves one square diagonally only. The kin, besides having similar movements, has also the power of moving one square on each side of itself, but it cannot return diagonally. The fu advances one square forward, and captures as it moves. When any piece moves into the adversary's third row, it may become a kin. This is indicated by turning the piece over. Every piece so promoted loses its original character, except the hisha and kaku to which the movements of the kin are added. As already indicated, a captured piece may be employed at any time for either attack or defence. To checkmate with the fu is a thing vetoed—or at least considered "bad form"—in this non-democratic game, neither is stalemate permissible in Japanese chess. You wait until the adversary makes a move which admits of a free action on your part. The object of the game is to check-mate the king.

Go Go, often with little appropriateness termed "checkers" by European writers, is the most popular of the indoor pastimes of the Japanese,—a very different affair from the simple game known to Europeans as Goban or Go-bang, properly the name of the board on which the go is played. Clubs and professors of the art are found in all the larger cities, where, too, blind players may occasionally be met with. Go may with justice be considered more difficult than chess, its wider field affording more numerous ramifications. The game was introduced into Japan from China by Kibino-Mabi, commonly known as Kibi Daijin, who lived in the reign of the Emperor Shomu (A.D. 724–756). In the middle of the seventeenth century, a noted player, called Hon-imbo, was summoned from Kyoto to entertain the Chinese ambassador then at the court of the Shogun, from which time forward special go players were always retained by the Shoguns.

Go is played on a square wooden board. Nineteen straight lines lengthwise and the same number of lines cross ways, crossing each other at right angles, make three hundred and sixty-one mé, or crosses, at the point of intersection. These may be occupied by a hundred and eighty white and a hundred and eighty-one black ishi or stones. The object of the game is to obtain possession of the largest number of mé. This is done by securing such positions as can be most easily defended from the adversary's onslaughts. There are nine spots on the board, called séimoku, supposed to represent the chief celestial bodies, while the white and black stones represent day and night, and the number of crosses the three hundred and sixty degrees of latitude, exclusive of the central one, which is called taikyoku, that is, the primordial principle of the universe. There are nine degrees or classes of

Digitized by Google

proficiency in the game, beginning with number one degree as the lowest, and ending with number nine as the highest point of excellence attainable. In playing, if the combatants are equally matched, they take the white stones alternately; if unequal, the weaker always takes the black, and odds are also given by allowing him to occupy several or all of the nine spots or vantage points on the board,—that is, to place stones upon them at the outset. A description of how the game proceeds would be of little utility here, it being so complicated as to make the personal instruction of a teacher indispensable. The easy Japanese game, called gomoku-narabé, which was introduced into foreign countries, is played on the go board and with the goishi. The object of this game is to be the first in getting five stones in a row in any direction.

Hanagaruta (Japanese Playing Card) The Japanese flower-cards developed from the classical "flower contests" which were originated far back in the 9th or 10th century A.D. by the elegance-loving ladies and gentlemen of the Kyoto Imperial court. At first the game was played by each contestant choosing a spray of some flower and writing a thirty-one syllable poem on a piece of coloured paper in praise of this flower and tying it to the twig. Then the flowers were collected and judged from the artistic, literary and various other points of view of the flower, poem and general colour effect.

These sprays of flowers came later to be represented in pictures, and probably under the influence of the Western card games introduced to Japan by the Portuguese of the 16th century, our flower-cards came into being. They present sprays of various flowers in the simplest but the prettiest design and colouring so characteristic of the art of the Tokugawa period, but at the same time they preserve all the poetic sentiments and associations of the courtly game of the flower contests.

A pack of the flower-cards consists of 48, and every four of them make a set presenting a flower. That is, there are 12 sets of fours presenting 12 different flowers or plants, as follows: young pine, plum blossoms, cherry blossoms, wistaria,iris, tree peony, lespedeza, grass hill, chrysanthemum, maple leaves, willow, and paulownia, one for each month of the year in the order given.

Among the 48 cards, there are 5 'glory cards,', each counting 20 points, and 9 10-point cards. These high-valued ones are at once distinguished by the various objects of classical associations presented together with the flowers. Each set,except the Grass Hill and the Paulownia, has a card with a poem strip on it, either of a red colour with letters written on, or of a red or blue colour in blank. These cards always count 5 points. The rest, 24 in number, are simple chips and each counts one point. To sum up, there are 48 cards in a pack and in all these cards count 264 points.

There are several ways of playing games with Hanagaruta: solitaire, hachi-hachi or "Game of Eighty-eight," "Six hundred," Sudaoshi, Mushi, and Kabu. But, the most popular and the most interesting of these is hachi-hachi. As in the case with bridge, the game may be played according to quite simple or elaborate rules.

Theoretically, a party of from two to six can play the game, it is most enjoyable when between three and half a dozen players are at the table.

The winner in the last round shuffles and deals the card. He deals 7 cards to each member and places 6 cards in the 'pool' face up. The remaining cards are placed in the centre of the pool in a pile, face downward. Each player then inspects his hand and declares if he will play or drop out. The hands of those who have dropped out are mixed in the cards in the pile. The player who dealt the cards has the first option to declare and the others in turn. In case three players declare to go, the remaining players are obliged to drop out, for not more than 3 can play each round. In case all but two drop out, the two play against each other, and should all but one drop out, the last remaining is the winner and so he shuffles and deals the cards for the next round.

The leader first plays one of the cards in hand the flower of which matches with that of one of the six cards in the pool, taking care to score the highest count possible. He then takes the topmost card in the pile and turns it over. In case the card so taken does not match with any in the pool he leaves it in the pool, but if the card matches with one in the pool, he scores that pair too. All cards thus matched are kept separate by the player who made the tricks. His next player is the one sitting on his right. Thus, in Japanese card playing, we go "against the sun" always.

Each player plays seven times and then all the cards will have been matched and taken. Then the scores are counted. There being 264 points in all, as explained before, one who scores 88 is at par. Hence the name, the "Game

the kako starts in with his volleys of noise; and forthwith the cormorants set to at their work in the heartiest and jolliest way, diving and ducking with wonderful swiftness as the astonished fish come flocking towards the blaze of light. The master must handle his twelve strings so deftly that, let the birds dash hither and thither as they will, there shall be no impediment or fouling. He must have his eyes everywhere and his hands following his eyes. Specially must he watch for the moment when any of his flock is gorged,—a fact generally made known by the bird itself, which then swims about in a foolish, helpless way, with its head and swollen neck erect. Thereupon, the master, shortening in on that bird, lifts it aboard, forces its bill open with his left hand, which still holds the rest of the line, squeezes out the fish with his right, and starts the creature off on a fresh foray,—all this with such admirable dexterity and quickness that the eleven birds still bustling about have scarce time to get things into a tangle, and in another moment the whole team is again perfectly in hand.

Calendar of Annual Events

Few countries, if any, possess more ceremonies and more festivities than Japan. Some of these ceremonies at first sight may look absurd to the foreign eye, but familiarity with them and especially their origin will reveal most of them to be delightful. Rural people are more conservative than city folk in adhering to observance of ancient customs. Indeed, modern life has robbed the busy citizens of that quiet and poetical mood in which people of bygone days observed ancient customs, such, for instance, as moon viewing. But none the less it is true that despite the modern garb Japan wears today, the life of the present-day Japan is still associated with many picturesque customs and poetical sentiments of Old Japan, which afford a glimpse into the days of feudalism, and the people continue to observe many of the customs handed down from time immemorial.

Below is given in chronological order a list of annual events in Japan, including ceremonies, festivals and other national customary observances.

January

January 1st New Year's Day—New Year's Day means as much to the Japanese as Christmas means to Western peoples, or probably more. It marks the beginning of new life in an atmosphere of quiet and gaiety, leisure and pleasure. It is a time to forget the cares of the past year and enjoy feasts and indulge in all sorts of amusement in celebration of the coming good and lucky year. The homes are decorated, both inside and outside; the people are clad in their best clothes, and they all look very happy.

The Imperial Household observes a religious ceremony called Shihohai (worshipping in four directions) at the Imperial Sanctuary according to Shinto rites. The Emperor usually officiates in person, offering prayers to the gods for the peace and prosperity of the Empire. New Year's Day is one of the four most important National Holidays of Japan, the others being the Imperial Birthday celebration, the celebration commemorating the anniversary of the accession of the Emperor Jimmu, the first Emperor of Japan, in 660 B. C., and the celebration of the Emperor Meiji's Birthday on November 3.

The time-honoured custom of worshipping the sun-rise at shrine compounds situated in the "lucky direction" of the year is widely observed from the traditional belief that so doing will bring luck. Many, of course, observe this custom without sharing the belief. The compound of the Meiji Shrine in Tokyo, for instance, is always filled with worshippers at dawn on New Year's Day. Ceremonies celebrating the New Year are also observed at all Shinto shrines throughout the country. On this day and the following two days people call on their relatives and friends and exchange New Year greetings.

2nd Beginning of Work—This day is known as 'shigoto hajimé,' or beginning of work and is marked with cremonies for the beginning of all sorts of activities which are to be executed properly and well in the right spirit, in the hope that everything will go on in the same happy way for the rest of the year. Young school children study calligraphy for the first time in the year. Carpenters begin the day by using their professional tools. Geisha tune up their samisen and practise a piece or two of music. The first delivery of goods is undertaken by all wholesale stores in a spirit of celebration. The last named is called hatsu-ni, or first merchandise. Cars on which goods are to be delivered

Digitized by Google

on this day are fully decorated, and the carriers and delivery men, usually drunk, enter into the spirit of the thing, although this custom is observed in recent years with less ostentation than formerly.

On the night of the second day, people were supposed, in ancient times, to dream the first lucky dream of the year. To inspire such a dream, pictures representing the Seven Gods of Fortune were sold in the streets, to be placed under the pillow so that the sleeper might dream a desired dream.

3rd Genshi-sai, a national holiday, celebrating the auspicious origin of the Imperial Throne at the beginning of the year, is observed on the third day before the Imperial Sanctuary in the Imperial Palace. The ceremony is attended by the Emperor, members of the Imperial family, Princes and Princesses of the Blood, high officials of the Government and members of the peerage. In the morning the front of the Nijubashi, the bridge at the main entrance to the Imperial Palace, presents a glittering scene as the dignitaries of the nation arrive at the palace in their State uniforms to participate in the court function. The New Year holidays come to an end on this day.

4th Beginning of Politics—All normal functions of the State are resumed on this day and government and private offices re-open. The Ministers of State make various important reports to the Emperor, and the Minister of the Imperial Household also gives an account of the ceremonies performed at the Grand Shrine of Isé and the other government-protected shrines on the occasion of the New Year.

5th The Shinnen Enkai, or New Year Party, is held at the Homéi Hall of the Imperial Palace, where the Emperor and Empress give a banquet to the Princes and Princesses of the Blood, Ministers of State, foreign diplomatic representatives and a large number of other dignitaries. The people in general also hold New Year parties and many persons are seen till a late hour on their way home from celebrations in a hilarious mood.

One of the most interesting features of Tokyo life on this day is the festival of the Suitengu shrine at Ningyo-cho. Here, right in the heart of the modern capital, a glimpse of old Japan reveals itself.

6th Tokyo fire-brigades assemble in an open space in front of the Nijubashi for the New Year parade and give acrobatic performances on fireladders to show their agility. There was a time in the old days when fires were so frequent in Yedo (Tokyo) as to be called "the flowers of Yedo." The life of the fireman was envied by many as inspiring. The performance of acrobatics was initiated in those days to reassure the public by demonstrating the efficiency of firemen when confronted with danger.

Cold Season begins—The so-called 'kan,' or cold season, begins its conventional period of four weeks. The cold season is divided into two stages, the period of 'shokan,' or lesser cold, and the period of 'daikan,' or greater cold. During the period many male apprentices and artisans devoted to their work go out thinly clad in the evening to worship at their favourite temples, having the traditional belief that divine power invoked by their enthusiasm will make them proficient in their callings. They go to the well in the temple compounds and pour cold water over their bodies to purify themselves before worshipping at the temples. The rite is practised for the whole period every evening without a break, irrespective of weather conditions. Such enthusiasts, dressed in white clothes and usually with tinkling bells hanging over their loins, can be seen in the streets during the cold season, running from temple to temple.

Decorations removed—All New Year decorations should be removed from the house fronts before nightfall, as the main New Year celebrations come to an end.

7th The Seven Herbs—On this day, known as 'nanakusa' (seven herbs), people eat rice gruel mixed with seven kinds of herb. This custom originated in the days of the threatened Mongolian invasions under Kublai Khan. The herbs were deemed to give strength to the Japanese soldiers, and they are now supposed to give strength to all consumers against the nation's enemies.

8th Military Review—The Emperor reviews the troops of the Imperial Bodyguard at the Yoyogi parade ground. The public can witness the review.

10th The Kompira Shrine holds its festival on this day. The shrine is located at Toranomon in Shiba, Tokyo. A feature of the festival is a fair at which many talismans are sold.

11th The Kodokwan, the celebrated judo training institution in Koishikawa, observes the ceremony of beginning judo practice for the year. The greatest experts in the art of self-defence participate in the ceremony, at which the finest matches of the year are seen.

12th Sumo (Japanese wrestling)—The semi-annual tournaments of the

Some of these ceremonies at first sight may look absurd to the foreign eye, but familiarity with them and especially their origin will reveal most of them to be delightful. Rural people are more conservative than city folk in adhering to observance of ancient customs. Indeed, modern life has robbed the busy citizens of that quiet and poetical mood in which people of bygone days observed ancient customs, such, for instance, as moon viewing. But none the less it is true that despite the modern garb Japan wears today, the life of the present-day Japan is still associated with many picturesque customs and poetical sentiments of Old Japan, which afford a glimpse into the days of feudalism, and the people continue to observe many of the customs handed down from time immemorial.

Below is given in chronological order a list of annual events in Japan, including ceremonies, festivals and other national customary observances.

January

January 1st New Year's Day—New Year's Day means as much to the Japanese as Christmas means to Western peoples, or probably more. It marks the beginning of new life in an atmosphere of quiet and gaiety, leisure and pleasure. It is a time to forget the cares of the past year and enjoy feasts and indulge in all sorts of amusement in celebration of the coming good and lucky year. The homes are decorated, both inside and outside; the people are clad in their best clothes, and they all look very happy.

The Imperial Household observes a religious ceremony called Shihohai (worshipping in four directions) at the Imperial Sanctuary according to Shinto rites. The Emperor usually officiates in person, offering prayers to the gods for the peace and prosperity of the Empire. New Year's Day is one of the four most important National Holidays of Japan, the others being the Imperial Birthday celebration, the celebration commemorating the anniversary of the accession of the Emperor Jimmu, the first Emperor of Japan, in 660 B. C., and the celebration of the Emperor Meiji's Birthday on November 3.

The time-honoured custom of worshipping the sun-rise at shrine compounds situated in the "lucky direction" of the year is widely observed from the traditional belief that so doing will bring luck. Many, of course, observe this custom without sharing the belief. The compound of the Meiji Shrine in Tokyo, for instance, is always filled with worshippers at dawn on New Year's Day. Ceremonies celebrating the New Year are also observed at all Shinto shrines throughout the country. On this day and the following two days people call on their relatives and friends and exchange New Year greetings.

2nd Beginning of Work—This day is known as 'shigoto hajimé,' or beginning of work and is marked with cremonies for the beginning of all sorts of activities which are to be executed properly and well in the right spirit, in the hope that everything will go on in the same happy way for the rest of the year. Young school children study calligraphy for the first time in the year. Carpenters begin the day by using their professional tools. Geisha tune up their samisen and practise a piece or two of music. The first delivery of goods is undertaken by all wholesale stores in a spirit of celebration. The last named is called hatsu-ni, or first merchandise. Cars on which goods are to be delivered

Digitized by Google

on this day are fully decorated, and the carriers and delivery men, usually drunk, enter into the spirit of the thing, although this custom is observed in recent years with less ostentation than formerly.

On the night of the second day, people were supposed, in ancient times, to dream the first lucky dream of the year. To inspire such a dream, pictures representing the Seven Gods of Fortune were sold in the streets, to be placed under the pillow so that the sleeper might dream a desired dream.

3rd Genshi-sai, a national holiday, celebrating the auspicious origin of the Imperial Throne at the beginning of the year, is observed on the third day before the Imperial Sanctuary in the Imperial Palace. The ceremony is attended by the Emperor, members of the Imperial family, Princes and Princesses of the Blood, high officials of the Government and members of the peerage. In the morning the front of the Nijubashi, the bridge at the main entrance to the Imperial Palace, presents a glittering scene as the dignitaries of the nation arrive at the palace in their State uniforms to participate in the court function. The New Year holidays come to an end on this day.

4th Beginning of Politics—All normal functions of the State are resumed on this day and government and private offices re-open. The Ministers of State make various important reports to the Emperor, and the Minister of the Imperial Household also gives an account of the ceremonies performed at the Grand Shrine of Isé and the other government-protected shrines on the occasion of the New Year.

5th The Shinnen Enkai, or New Year Party, is held at the Homéi Hall of the Imperial Palace, where the Emperor and Empress give a banquet to the Princes and Princesses of the Blood, Ministers of State, foreign diplomatic representatives and a large number of other dignitaries. The people in general also hold New Year parties and many persons are seen till a late hour on their way home from celebrations in a hilarious mood.

One of the most interesting features of Tokyo life on this day is the festival of the Suitengu shrine at Ningyo-cho. Here, right in the heart of the modern capital, a glimpse of old Japan reveals itself.

6th Tokyo fire-brigades assemble in an open space in front of the Nijubashi for the New Year parade and give acrobatic performances on fireladders to show their agility. There was a time in the old days when fires were so frequent in Yedo (Tokyo) as to be called "the flowers of Yedo." The life of the fireman was envied by many as inspiring. The performance of acrobatics was initiated in those days to reassure the public by demonstrating the efficiency of firemen when confronted with danger.

Cold Season begins—The so-called 'kan,' or cold season, begins its conventional period of four weeks. The cold season is divided into two stages, the period of 'shokan,' or lesser cold, and the period of 'daikan,' or greater cold. During the period many male apprentices and artisans devoted to their work go out thinly clad in the evening to worship at their favourite temples, having the traditional belief that divine power invoked by their enthusiasm will make them proficient in their callings. They go to the well in the temple compounds and pour cold water over their bodies to purify themselves before worshipping at the temples. The rite is practised for the whole period every evening without a break, irrespective of weather conditions. Such enthusiasts, dressed in white clothes and usually with tinkling bells hanging over their loins, can be seen in the streets during the cold season, running from temple to temple.

Decorations removed—All New Year decorations should be removed from the house fronts before nightfall, as the main New Year celebrations come to an end.

7th The Seven Herbs—On this day, known as 'nanakusa' (seven herbs), people eat rice gruel mixed with seven kinds of herb. This custom originated in the days of the threatened Mongolian invasions under Kublai Khan. The herbs were deemed to give strength to the Japanese soldiers, and they are now supposed to give strength to all consumers against the nation's enemies.

8th Military Review—The Emperor reviews the troops of the Imperial Bodyguard at the Yoyogi parade ground. The public can witness the review.

10th The Kompira Shrine holds its festival on this day. The shrine is located at Toranomon in Shiba, Tokyo. A feature of the festival is a fair at which many talismans are sold.

11th The Kodokwan, the celebrated judo training institution in Koishikawa, observes the ceremony of beginning judo practice for the year. The greatest experts in the art of self-defence participate in the ceremony, at which the finest matches of the year are seen.

12th Sumo (Japanese wrestling)—The semi-annual tournaments of the

Digitized by Google

Japan Wrestling Association are held at the Kokugi-kan amphitheatre at Ryogoku, Tokyo, in January and May. Each tournament lasts for 13 days. (See Chapter XXXVI.)

15th and 16th Extra holidays for apprentices and servants—in old days apprentices and servants were given only two day's holidays a year, January 15 or 16 and July 15 or 16. Nowadays they are given at least one holiday a month in many cases, but in addition the old holiday-dates are still adhered to.

February

February 1st Country people, who still go by the lunar calendar, celebrate the New Year on this day.

3rd or 4th The Bean-throwing ceremony—This day is called 'Sétsubun,' or change of season, on which winter comes to an official end and spring begins according to the lunar calendar. 'Mamémaki,' or the bean-throwing ceremony, is widely practised throughout the country. People scatter beans in an attempt to drive out all the evil spirits in the house and call in good luck. The priests of leading shrines and temples observe this custom in the presence of thousands of worshippers. Usually popular actors and wrestlers are employed as bean-throwers.

11th Commemoration of the Accession of the Emperor Jimmu—This national holiday, Kigensetsu, commemorating the accession in 660 B.C. of the first Emperor of Japan to the Throne, is one of the most important in the Japanese calendar. The Emperor observes elaborate ceremonies in front of the Imperial Sanctuary, attended by the Empress, Princes and Princesses of the Blood, court functionaries and high officials of the Government, and peers. An Imperial luncheon is given at the Homéi Hall of the Palace, to which are invited the Princes and Princesses of the Blood, State Ministers, members of the foreign diplomatic corps, etc.

March

March 3rd Girls' Doll Festival—This is sometimes known as the peach festival, because it is associated with the peach blossoms which begin to open about this time. This day is a great day for the girls of Japan. All families, except the poorest, place decorated doll sheives in the guest rooms or alcoves with a set of dolls and accessories on them. Very often the dolls are taken out from the closets and displayed for the enjoyment of the young girls of the family. The set of dolls is supposed to represent a miniature Court of ancient days with the Emperor, Empress, and their retainers. Some of the sets in wealthy families are very valuable, costing several hundred yen each. Dolls are displayed for sale at department stores and stalls for some weeks before the arrival of this festival. Considerable religious significance was originally attached to the doll festival, but later it became a mere pastime for children. It is said by some that the custom encourages happy family life, and by others that it encourages the spirit of filial piety and loyalty. Scholars declare that the custom originated during the reign of the Emperor Tsuchimikado (1199–1207).

6th The Empress's Birthday—This day is known in Japanese as Chikyu-sétsu, and is a holiday for girls' schools.

18th Higan, the Week of the Equinox, is a busy time for Buddhist families. Usually, all members of the family visit the family graveyard during the week, attend to the tombs and offer prayers to the spirits of their ancestors. Higan, literally translated, means "yonder shore," or Nirvana. Various vegetable foods specially prepared for the purpose, are offered to the dead and sent as presents to friends and relatives. All Buddhist temples in the country hold special services during the period. Tokyo old-fashioned Buddhist believers make special pilgrimages to the images of the six-faced Amida Buddha at 18 temples situated in the hilly sections of the city and suburbs.

21st Vernal Equinox Festival—On this national holiday, which is called Shunki Korei-sai, all schools and public buildings are closed. A Shinto festival in memory of the Imperial ancestors and ancestresses is performed at the Imperial Sanctuary.

April

April 3rd Anniversary of the demise of the Emperor Jimmu, national holiday—This day is the anniversary of the demise of the first Emperor Jimmu, who reigned over the country for 76 years. The Emperor performs an appropriate ceremony in front of the Imperial Sanctuary.

8th Birthday of Gautama Buddha—This day, kept as the anniversary of the birth of Gautama Buddha, is celebrated by all Buddhist temples throughout Japan. Leading temples arrange parades of young girls who are daughters of Buddhist believers, and hold memorial services in honour of the founder of their religion. Amacha, sweet tea, is freely given at the temples

Digitized by Google

guardian deities and their safe growth throughout the period of early childhood, at the same time beseeching future protection and happiness.

23rd Festival of Niinamé-sai—The Emperor observes Niinamé-sai, a national holiday, with the ancient Court ceremony of offering new grain to the Sun Goddess and the Imperial ancestors, and partaking of it himself. The occasion is one of thanksgiving, when the Emperor and his subjects return thanks for the harvest.

28th Anniversary of the death of St. Shinran—A religious fête in commemoration of the death of St. Shinran, founder of the Shin sect of Buddhism, is celebrated at the Honganji temples in Kyoto and Tokyo.

December

December 22nd Winter Solstice—On this day people take baths in hot water in which 'yuzu' or limes have been placed, according to the time-honoured custom.

25th Anniversary of the death of the Emperor Taisho, father of the present Emperor, a national holiday.

25th Christmas—Christmas has become an important affair for many Japanese living in cities. Although at first it was regarded by the general public as an event entirely foreign to Japan, it has now become a season of rejoicing for children in large cities, and the day is a regular annual feature, included in the Japanese calendar as such.

29th Close of official business—All government and public offices close for the year-end and New Year holidays.

31st Eating of noodles on the last day of the year—It being the last day of December, many businessmen eat noodles at their evening meal to bring the year to a happy conclusion. The noodle is regarded as a symbol of long life and continued prosperity.

Digitized by Google

a week.

21st Hottest season—The doyo, the hottest period of summer, begins on or about this day, to last for about three weeks.

August

August 4th Annual festival of the Kitano Shrine in Kyoto.

6th Annual festival of the Sumiyoshi shrine in Tsukudashima, Kyobashi, Tokyo.

16th Annual Bon-fire Fête on Mount Nyoi in Kyoto.

19th Lantern Fête on Mount Atago in Kyoto.

September

September 1st Memorial Service for the Earthquake Dead—to comfort the spirits of those who were killed in the great earthquake and fire of 1923 services are held at the Earthquake Memorial Hall in Honjo on the banks of the Sumida River, Tokyo.

5th Suitengu Shrine Festival in Tokyo.

13th Festivals of Kanda Myojin and Hikawa Shrines in Tokyo.

17th and 18th Festival of the Great Shrine of Isé and the Hokoku Shrine in Kyoto.

20th Week of the equinox begins—the autumn 'higan' begins on September 20. As during the spring equinoctial week, Buddhist temples present busy scenes.

23rd Festival of the Autumnal Equinox—A Shinto festival in memory of the Imperial ancestors is performed at the Imperial Palace, the day being a national holiday.

26th Moon-viewing Festival—The custom of moon-viewing is no longer observed so generally as in the past, but it still delights the poetically minded in the cities, and people in general in the rural districts. Before twilight sets in, the house wife will bring a table to the veranda where it can catch the moon beams and spread upon it a feast in honour of the moon. A vase containing autumnal flowers will be placed on the left side of the table. As the moon rises, the members of the family sit around the table in the moonlight and spend the evening in merry-making.

October

October 10th Annual fête of the Kotohira Shrine at Kotohira, Kagawa prefecture and also of similar shrines in Tokyo and elsewhere.

13th Anniversary of the death of St. Nichiren—One of the most elaborate Buddhist demonstrations in Japan is held on the evening of the 12th, and the following day at the Hommonji temple at Ikégami, Tokyo, to commemorate the anniversary of the death of St. Nichiren, founder of the Nichiren sect of Buddhism. Thousands of believers and others march in groups to the temple, many beating drums so as to keep time, shouting all the time the Buddhist sutra, "Namu-Myoho-Renge-kyo." Large paper lanterns, all lighted, are carried at the head of those processions.

15th Hunting season—The ban on hunting in all districts is lifted.

17th Kannamésai (first Harvest festival) on this national holiday the Emperor makes an offering of the new grain harvested to the Sun Goddess enshrined in the Great Shrine of Isé and to the Imperial ancestors. A special service is held at the Imperial Sanctuary, while the Emperor despatches a messenger to the Great Shrine to offer prayers on his behalf.

22nd Festival of Yasukuni Shrine—The Yasukuni shrine begins its second semi-annual celebration, lasting for three days.

November

November 1–12 Festival of Oh-tori shrines—the annual shrine festival known as 'tori-no-ichi,' is observed on the "Tori no Hi", or the day of birds, that may fall on one of the first 12 days according to the old calendar which counts days by the names of 12 animals, at various shrines of Oh-tori, a winged god of fortune and wealth in Tokyo and elsewhere. There are the second and third 'tori-no-ichi' in the month.

3rd Celebration of the Emperor Meiji's Birthday—This is a national holiday and all schools and public buildings are closed in honour of the great Emperor during whose reign Japan became a world Power, and the week is celebrated as a national athletic week.

8th Festival of Bellows—This is celebrated in the household of every metal-smith, silver-smith, iron-smith, and the like. On this day also takes place the annual bonfire fête of the Fushimi Inari Shrine in Kyoto and elsewhere.

15th Celebration for children of 3, 5 and 7 years of age—This is known as "shichigosan (7, 5, 3) festival". On this day boys who have attained the age of 5 years and girls who have attained 3 or 7 years of age are taken to the shrines of their tutelary deities, in their best clothes, and worship is offered at the shrines by way of expressing their gratitude for the protection of the

Digitized by Google

buildings in 1936 numbered 44,404.

Area The total area of the city of Tokyo in January, 1937, was 537,571,996 square kilometres. The classified ownership in January, 1937 follows:

Ownership	Area (In square metre)
Total	535,571,996
Imperial household	6,481,434
State	76,880,668
Tokyo prefecture	996,320
City	14,097,807
Private persons	434,115,767

Tokyo Enlarged

The development of modern Tokyo is best endorsed by the giant growth of the adjoining towns and villages.

Socially and economically the towns outside the city area have been closely connected with the city itself. The position regarding Tokyo during the 10 years ending 1930 was that the 82 adjoining towns and villages increased in population by 1,720,000, while the city of Tokyo lost 100,000 within the same period. In road construction, extension of communication facilities and in the execution of various municipal regulations the city experienced enormous difficulties due to the existence of over 80 different self-governing bodies surrounding the city area.

As is generally the case with great cities, a large number of people living in adjoining towns enter the city to earn their living. They are placed on exactly the same footing with the citizens in so far as the utilization of metropolitan facilities is concerned. Besides, as most of them are salaried men belonging to middle or intelligent class, to let them stand aloof from city government means an enormous loss to both.

It was after taking into careful consideration all these practical phases of administration that on October, 1932, new Tokyo was founded by amalgamating 20 more wards. The newly annexed suburban towns then had 3,211,580 inhabitants and 469.029 sq. km., a density of 9,034 persons to the square kilometre.

The enlarged Tokyo now covers 570.-337 square kilometres divided into 35 wards.

Commerce and Industry

Retail Business At the end of July, 1936, the number of retail shops in the city was 164,438. Sweetmeats shops numbered 18,225, rice shops 8,054 and vegetables and fruits shops 6,853. Retail price index numbers based on the prices of December 16, 1929, as 100 follow :

RETAIL PRICE INDEX NUMBER IN TOKYO

(Of 100 Kinds of Commodities)

(The average retail price on Dec. 16, 1929 taken as 100)

	Foodstuffs	Clothing, etc.	Fuel	Building materials	Miscellaneous	Gross Average for Tokyo	Average for 13 cities
1933	85.6	85.0	91.3	104.1	92.2	87.8	87.1
1934	86.9	87.9	91.9	104.9	90.6	89.1	88.8
1935	90.0	87.7	92.3	100.7	89.7	90.4	90.5
1936	96.2	89.5	93.4	103.9	89.2	94.5	94.8
1937	98.1	105.8	108.6	147.7	105.4	104.7	104.2
1938	110.3	135.5	124.6	179.1	125.2	122.9	121.6

Wholesale Price The whole-sale average price index number for 100 kinds of commodities in 1938 was 130.9 against 100 of the average wholesale price index of December, 1929. Below are given detailed figures :

WHOLESALE PRICE INDEX NUMBER

	Foodstuffs	Textile goods	Metals	Building materials	Chemicals	Fertilizers	Fuel	Miscellaneous	Aggregate average in Tokyo	Average in 13 cities
1933	92	93	125	98	87	87	93	112	96.7	95.4
1934	90	93	120	101	81	83	97	103	95.2	96.3
1935	96	88	109	98	67	93	100	100	95.7	97.4
1936	103	90	107	97	50	97	104	98	98.0	101.2

1938	114	141	185	140	85	124	134	144	130.9	140.2

Digitized by Google

Banks At the end of 1936 there were 24 banks domiciled in Tokyo and 327 branch offices. Three were special banks, i. e. semi-governmental banks. The number of ordinary commercial banks was 16, with 175 branches in the city. Savings banks numbered 5 with 57 branches. The aggregate capital of the special banks was ¥225,275,000 of which the amount paid up was ¥186,-151,062. The aggregate of deposits was ¥762,648,485 and the aggregate amount of advances and discounts was ¥2,457,-916,853. The aggregate capital of the ordinary banks was ¥510,488,500, the amount paid up was ¥341,147,000, deposits ¥4,762,690,179 and advances and discounts totalled ¥2,720,116,917. The aggregate capital of savings banks was ¥15,535,000 of which ¥11,922,500 was the total sum paid up, deposits ¥861,523,601 and advances ¥160,214,962. There were 93 branches of banks domiciled in other cities, and the total number of banks and branches in the city was 351, with an aggregate deposits of ¥3,954,923,444 and advances of ¥3,009,138,140.

Industry At the end of 1936 there were, in Tokyo, 29,544 small working shops, where less than 5 operatives were employed, with 47,279 workers, and 13,-326 factories, where more than 5 operatives were employed, with 329,439 workers.

FACTORIES IN TOKYO

(At the end of 1936)

Kind of Industry	Factories	Operatives	Production (In yen)
Textile	2,460	39,007	174,370,075
Metallic	5,555	61,044	343,252,277
Machine and Tool	7,360	131,160	464,977,851
Ceramics	720	9,828	19,983,780
Chemical	2,263	40,438	377,581,735
Sawing and Wood-work	2,873	12,770	34,356,265
Printing and Book-binding	3,346	29,456	120,199,054
Foodstuff	14,234	24,118	180,630,498
Gas and Electric	7	858	32,233,354
Others	4,052	28,039	82,632,565
Total	42,870	376,718	1,830,217,454

Companies At the end of 1936 there were 16,904 companies in Tokyo, with an aggregate capital of ¥10,734,735,959 of which ¥8,023,539,609 was paid-up, and their net profits in 1935 amounted to ¥825,336,385.

COMPANIES IN TOKYO CLASSIFIED BY INDUSTRIES

(At the end of 1936)

Industry	Number	Paid-up-Capital (In Yen)
Agriculture	113	78,991,222
Aquatic	30	102,153,000
Mining	304	788,940,462
Manufacturing	6,376	3,689,576,851
Commercial and Banking	9,589	2,905,058,794
Traffic	492	458,819,280
Total	16,904	8,023,539,609

Transportation

Roads At the end of 1936 the total mileage of public roads in the city was 8,414,676 metres covering an area of 48,-005,106 square metres or 8 per cent of the total city area.

Railway Service In the fiscal year ending March 31, 1937 there were in aggregate 420,627,220 boarding passengers and 419,349,144 alighting passengers at 65 different governmental railway stations in the city, and the earnings in these 65 stations totalled ¥59,823,498 which was ¥3,300,000 more than in the previous year. The business results of 15 private railway companies in the year under review, exclusive of their bus services, were : the aggregate number of passengers, 288,014,194 and the aggregate amount of earnings ¥19,116,-547, and the total length of lines in operation 239 kilometres.

TRAFFIC SERVICE OF STATE RAILWAYS FOR TOKYO

Year	Stations	Passengers Who Got in	Passengers Who Got off	Earnings (In Yen)
1930	63	343,997,611	339,973,445	50,119,289
1931	64	333,885,569	332,022,462	48,242,225

Waterworks

The construction of modern water reservoirs was first commenced in 1890 and it was twenty years before the Yodobashi water reservoir was completed. But this proved inadequate to meet the ever growing water consumption and the Murayama water reservoir was constructed in 1916. It consists of two reservoirs, upper and lower, and the upper reservoir has a capacity of 3,576,000 cubic metres while the capacity of the lower one is 12,148,000 cubic metres. In 1934 another reservoir at Yamaguchimura was completed and it has a capacity of 18,824,000 cubic metres. The total volume of water which can actually be maintained by these reservoirs at any given moment reaches 30,056,000 cubic metres. The total number of hydrants in Tokyo in March, 1937, was 863,400, and the total quantity of water distributed during 1936-37 was 333,740,073 cu. m. In March, 1935, the city bought all rights of the Tamagawa Waterworks which had been supplying water to the six southern wards.

Sewerage Works

General Conditions Until half a century ago waste water used to be discharged into moats, navigable canals

Digitized by Google

and rivers. In 1876, there was a violent outbreak of cholera which impressed upon the Government the urgent need of a general water and sewerage system, but it was not until between 1883 and 1885 that Tokyo prefecture laid the first sewers, with a government subsidy. The subject of sewage disposal was not undertaken in earnest until 1911, and it was not until ten years later that the modern Mikawajima Disposal Works were opened. Extensions and modernization are still going on. At present there are 7 sewage siphons at Sunamachi and Mikawajima.

Within the old city limits there are no longer any open street drains visible, the same, unfortunately, cannot be said of the new city area, though further development of the sewerage system is being planned.

In 1934 there were 428,155 square metres of undergrounds in use for the laying of iron pipes and the aggregate length of iron-pipes laid down was 1,402,674.57 metres in contrast to 1,146,428.24 metres in 1932. Moreover, 169,090,004 square metres of sewerages were the aggregate volume that were siphoned in the year under review and the water volume disposed of totalled 167,398,778 square metres.

SEWERAGE WORKS IN TOKYO

(For the fiscal years 1932–1935)

	1933	1934	1935

Sewerage washed out in cu. m.	6,491,972	25,227,310	

Parks

Parks The absolute necessity of parks is more keenly felt in Tokyo than in other cities in Japan because many lives were saved through the existence of parks on the occasion of the terrible earthquake of September, 1923.

At the end of 1935 Tokyo had 105 parks with an area of 2.747 square kilometres.

In the old city area there are three large parks :. Sumida, Kinshi and Hamacho and 89 others of about 2,682,136 sq. m., whereas before the earthquake the city had only Ueno, Hibiya and 32 other parks. Within the newly annexed quarters of the city there are two at Shinagawa covering an area of 3,900 tsubo.

Sumida park has an area of 174,400 sq. m., Hamacho park 36,000 sq. m. and Kinshi park 56,000 sq. m. All of the numerous small parks are laid out adjoining for the most part elementary schools. They serve as local parks, the largest being 4,700 sq. m. and the smallest 1,700 sq. m. in area.

Education

In the fiscal year 1935 there were 285 kindergartens in Tokyo of which 124 were in the old city limits. The number of elementary schools was 590, of which 217 were in the old city limits. Schools equivalent to elementary grade numbered 74, of which 44 were in the old city limits; blind, deaf, and dumb schools numbered 9; middle schools 51 and girls schools 74. Various schools of middle grade numbered 27; business and technical schools 137, normal schools 3, young people's schools 206 and various private schools 281. As for higher education there were 2 higher girls normal schools, 3 business teachers' institutes, 72 professional schools (colleges), 4 higher schools, and 22 universities.

Social Education The Social Education Bureau of Tokyo municipality, established in 1921, looks after the social education of the capital.

Adult education is effected through the medium of Commercial and Industrial Young Men's Cultural Schools and citizens' lecture courses, both of which give lectures to citizens for a term of half a year, at night or on Sundays and holidays. At other times short time lecture or training courses are arranged for citizens in general. Free use is made of music and the cinema.

The Tokyo Self-Government Hall, Hibiya park, is a permanent organ for social education with the object of fostering an autonomous spirit among the citizens, as its principal raison d'être.

Training of Young Men In July, 1934, there were 26 Young Men's Training Institutes with 15,599 students.

Young People's Schools In 1936 there were 175 municipal young people's schools and 29 similar institutes with 31,698 aggregate number of students.

Religion

At the end of 1934 there were 1,874 Buddhist temples of various sects, the total number of priests counting 4,301 and adhering families 200,779. The Jodo sect was strongest in point of the number of temples, which were 422. The next position was occupied by the Shingon Sect with 392. Below are given details of various sects of Buddhism.

Social Work

Child Welfare At the end of March, 1936 there were 26 maternity hospitals including three municipal-owned, and in 1935-36 there were 25,248 in-patients of expectant mothers, and 552 patients treated in travelling and the number of births given was 21,897 of which 1,022 were still births. In the same year there were 100 relief nurseries where working mothers and fathers can leave their children when going to their daily work. The total number of babies and children who were brought into these nurseries in the year was 7,593.

The total number of facilities for child protection was 310 which included 100 for baby protection, 11 nurseries, 17 for juvenile protection, 37 health consultation rooms, 104 for the education of the poor and deformed, 31 children's play grounds and libraries, and 10 for special protection of children.

Labour Exchanges Activities of municipal and private labour employment offices which number 49 in all can be seen from the following:

BUSINESS RESULT OF LABOUR EXCHANGE

Administration and Government

History In July, 1868, the Emperor Meiji granted an Imperial message on the proposed removal of the capital to Tokyo. It was the beginning of the regeneration of Tokyo. At the same time the downfall of the Shogunate régime was announced and new Japan was born.

The Tokyo prefectural office was established soon after the issuing of the Imperial Rescript. In 1871, the city was divided into 6 large wards, but seven years later these wards were abolished and 15 smaller wards established. In 1879, as the governor of the prefecture saw that these 15 wards were firmly established, he issued a decree concerning the formation and functions of ward assemblies, and thus instituted the first representative government system in this country.

Legislative Body To control municipal business the city has a city council and board of aldermen with a mayor as the head. Further, there are several departments, bureaux, sections, etc., for the execution of municipal affairs and office work.

Membership of the city council is an honorary position, the term of service being 4 years. The membership at present is 144, but owing to resignation of and death of members, the actual membership at the end of 1934 was 139. The principal functions of the council are the enactment and reorganization of city regulations, decisions as to finance, approval of settled accounts, imposition and collection of city taxes; and the right of proposing any bill, except the budget for annual revenue and expenditure. The board of aldermen of Tokyo once was the executive body, but in 1911 it became a legislative body. It is composed of 15 honorary aldermen to whom the mayor is added as chairman. The functional powers include the right of proposing any bill or expressing opinions on other matters.

Executive From 1889 till 1898 the function of the mayor of Tokyo was entrusted to the governor of Tokyo pre-

Digitized by Google

fecture, but on October 1, 1898 the city became self-governing. The mayor is elected by the city council. Under the mayor there are three deputy mayors, a city counsellor, a treasurer, directors of departments, chiefs of bureaux, ward heads and other numerous offices. There are various kinds of committees as consultative bodies. The organization of the municipality is as follows :

THE DEPARTMENTAL ORGANIZATION OF THE TOKYO MUNICIPALITY

Sections	Functions
Private secretariat	Secret matters, keeping of seals, ceremonies and reward
Personnel	Personnel administration
General secretariat	General affairs, municipal research, elections, legal affairs, etc.
Bureaux	
Supervising	Supervision and inspection of municipal affairs
Finance	Budget, loans, public land, taxation, purchasing, etc.
Industrial	Industry, promotion of industry and commerce, agriculture, fisheries and stock raising
Education	Management of schools; education, libraries, museums, etc.
Social Work	Protection and correction. Management of lodging houses, housing, labour exchanges, commercial training, etc.
Public Health	Management of hospitals, social hygiene, refuse disposal, park and playgrounds, auditoriums, cemeteries, zoological gardens, etc.
Water Works	Water supply and extension
Public Works	Roads, bridges, harbours and rivers, sewage disposal, buildings, etc.
Electric	Supply of light and power: electric cars, motor buses, subways, etc.
Divisons	
Harbour	Care of Tokyo harbour
Municipal Office Building	Building the City Hall at Tsukishima
Miscellaneous	
Central wholesale Market	Wholesale of provisions
Poor Asylum	Protection of helpless persons aged or young
Hygiene Laboratory	Investigations on epidemics, bacteria, etc.
Electric Laboratory	Examination of meters and scientific research on electricity.

Finance

The 1937-38 municipal budget was ¥239,728,780 for revenue and ¥238,455,096 for expenditure. The following table shows the settled accounts for 1928-29 to 1935-36 and budgets for 1936-37 and 1937-38. Among the enterprises tramways, bus, gas, and water works are included.

The International Exposition of Japan

Tokyo is actively engaged in making preparations for the International Exposition to be held in Japan in 1940. The actual work was begun early in 1938 by the sending abroad of special commissions for inviting foreign participation; and the first lot of admission tickets with lottery coupons amounting to ¥10,000,000 was issued for advance sale in March of this year.

The Exposition has the honour of having H.I.H. Prince Chichibu as Patron and Prince Fumimaro Konoé, Premier, as Vice-Patron. Hon. Shinji Yoshino, Minister of Commerce and Industry, and Baron Yoshiro Sakatani are its Honorary Presidents. Hon. Ginjiro Fujihara is the President, Hon. Sempachi Soejima is the Director-General, and Hon. Naokichi Matsunaga is the Assistant Director-General. The Exposition is to be held for 5 months from March to August, 1940, in commemoration of the 2,600th anniversary of the accession of Jimmu Tenno, Japan's first Emperor. The site is on the reclaimed grounds along the water-front of Tokyo Harbour, 10-minute drive from Ginza, the shopping centre of Tokyo, with the auxiliary site on Yamashita-cho along the water-front of Yokohama Harbour. The total area covers 900 acres including 400 acres for buildings and amusement grounds, 500 acres for aquatic sports. The construction motif of the Exposition will be the blending of the Eastern and Western modes of architecture. The exposition is estimated to cost ¥95,000,000, including ¥44,500,000 on items of direct expenditure and ¥50,500,000 for the reclamation of the grounds and civic improvements. All kinds of vehicles will be at hand for conveying guests with transportation facilities capable of handling 80,000 persons per hour and a parking accommodation for 6,000 automobiles. The total attendance is estimated at 45,000,000 with a daily average of 266,000 and a daily maximum of 532,000.

The Exposition hopes to exhibit the best products of the world with the sympathy and co-operation of all the nations of the world and to contribute to the cultural advancement of the Japanese people, and hopes, as the first international exposition to be held in Japan, to be instrumental in bringing the Oriental and Occidental civilizations closer together to give a stimulus to world industries, and to create a better understanding between Japan and other countries of the world.

The year of opening of the exposition has been postponed on account of the present international conflict, but it will be decided upon later.

CHAPTER XXXIX

FIVE BIG CITIES

Osaka

General

Geographical Position The city of Osaka is situated nearly in the centre of Japan proper, near the eastern entrance of the Inland Sea with easy access to the Pacific Ocean, while on the other sides extend the fertile plains of the provinces of Settsu, Kawachi and Izumi. The city of Kyoto, the ancient capital of Japan, is situated 43 kilometres to the north-east, and the city of Kobé lies 32 kilometres to the west. The river Yodo runs through the city, and with the numerous canals that connect with it affords excellent transportation facilities by water. The Yodo rises in Lake Biwa, the largest fresh water lake in Japan, and branches off into the Shin Yodogawa, Okawa, Dojimagawa, Tosaborigawa, Ajikawa, Kizugawa and the Shirinashigawa, which in turn connect with numerous canals, the most famous being the Dotombori Canal.

Area The area of the city of Osaka is 187.37 square kilometres which means it ranks third so far as the area is concerned exceeded by Tokyo and Kyoto, but in point of population it is the largest, next only to Tokyo. Its city limits were extended twice in its history, the first time in 1897 and the second in 1925. The city is divided into 15 ku (wards) which are: Kita, Nishi, Minami, Higashi, Konohana, Minato Taisho, Tennoji, Naniwa, Nishiyodogawa, Higashiyodogawa, Higashinari, Asahi, Sumiyoshi, and Nishinari.

Population The estimated population of Osaka was on Oct. 1, 1938, 3,321,200 men numbering 1,773,500 and women 1,547,700, according to the Cabinet Bureau of Statistics. The comparison of the last 4 years follow:

Population, 1934-1937.

	Men	Women	Total	Households
1934 (Oct. 1)	1,445,000	1,277,700	2,722,700	—
1935 (Oct. 1) (Census)	1,594,151	1,395,716	2,989,866	630,232
1936 (Oct. 1)	1,654,900	1,447,000	3,101,900	653,900
1937 (Oct. 1)	1,715,100	1,497,900	3,213,000	677,800
1938 (Oct. 1)	1,773,500	1,547,700	3,321,200	—

Each of the 15 ku (wards) is inhabited by a population of more than 100,000, with the Minato-ku 341,800 Higashinari-ku 343,000 and Sumiyoshi-ku, 319,300, according to the investigation of 1937.

The population of Japan could be dividable in 1935 between 22, 666,307 (32.7%) of urban districts and 46,587,841 (67.3%) of rural districts and the population Osaka was 13.2% of the entire urban population.

In 1937 births numbered 87,144 (27.1 per 1,000 of population) of which 44,946 were male and 42,197 female, increase of 1,815 (2%) and decrease of 0.4% in rate of birth in comparison with the previous year. In the same year deaths numbered 49,571 (15.4 per 1,000 of population) of which 26,486 were male and 23,085 female.

In the same year still-births totalled 5,800 (1.81 per 1,000 of population) of which male numbered 3,202 and female 2,471, and 30% of the still births were of the parents unmarried.

Deaths occured most numerously in December and the least in May. 10,190 (21%) of the deaths took place in the ages under 1.

As for the causes of deaths, 96.4% were illness and 1.2% suicide. Of the deseases 13.0% were pneumonia and 12.3% tuberculosis.

Residents from Overseas territories and Foreign Countries, Coreans residing in Osaka at the end of 1936 were 224,749 (133,806 being men and 90,943 women), an increase of 22,438 over 1935. Formosans numbered 175 (107 being men

1938 total	795,329,000	—	518,076,000	—

Transportation

Roads At the end of 1937 the total road area of Osaka was 13,909 square km., 7.4% of the entire area of the city and the total road length was 2,565,000 metres. The total area of paved roads was 6,280,000 sq. metres, an increase of 13.4% compared with the previous year.

Rivers, Canals and Bridges Osaka is the Venice of Japan in that there are many canals, and to that fact she owes much of her development as a big commercial and manufacturing center. Rivers that run through the city number 12 and canals four which are serving the city as effective means of transportations. The total length of rivers in 1937 was 182,980 metres and the total number of bridges was 1,318 in the same year.

Tramway and Bus Lines At the end of March, 1938 the business kilometerage of street tramways was 106.6 kilometres, the number of passenger cars in use counting 765. The total number of passengers in 1937 was 276,191,000 (5.0% increase from 1936) and the total revenue ¥15,410,000 (4.6% increase from 1936). All tramway lines and some bus lines are operated by the Municipality.

The subway work was first started in 1930 and its operation between Shinsaibashi and Umeda was inaugurated in 1933, and then the line was extended southward from Shinsaibashi to Namba in October, 1935, the total business kilometerage on December 31, 1937 being 4.1 and the number of cars 23. The total number of passengers in the whole year of 1937 was 16,644,000 with fares totalling ¥1,441,000. The subway lines are also operated by the city.

Suburban Electric Railways On March 31, 1937 there were 9 private companies operating suburban electric lines to various suburban points with a total kilometerage of 929 carrying 1,161,000 passengers per day in average and fares per day being ¥135,000.

These Companies are Nankai Railway Company, Hanshin Electric Railway Company, Hanshin Express Railway Company, Keihan Electric Railway Company, Osaka Denki Kido Company, Sangu Electric Railway Company, Osaka Railway Company, Hankyu Electric Railway Company, Hankai Electric Railway Company, Hamadera, Kishiwada, Wakayama, Nara, Yoshinoyama, Ujiyamada and Kuwana and chief points that are reached by those electric railways.

Sea Transportation The Osaka Harbor is one of the three largest ports in Japan and steamships that entered the port in 1936 numbered 24,486 (21.7% increase from 1935). Sail boats numbered 189,653 (29.1% increase from 1935).

Airways Osaka is an important airway point in Japan. The Nippon Air Transportation Company is operating its regular airway passenger service with Osaka as a center-point, Tokyo to Osaka and Osaka to Fukuoka, thence to various points of Chosen and also southward to Taiwan. The Nippon Air Transport Institute is operating the air way service between Osaka and Beppu and between Osaka and Shirahama. In 1937 passengers who left from the Kizugawa airport numbered 4,822 and those who arrived 5,302.

Education

On March 1, 1937, there were Kindergartens and schools in Osaka totalling 941 against 765 of the previous year; teachers, professors and nurses numbering 15,885 against 13,895 of the previous year; and pupils and students 517,953 against 485,201 of 1936. Schools and kindergartens established by the Municipality numbered 529: schools alone established by the Prefecture and the Government 30; and private schools and kindergartens 382.

Kindergartens numbered 121 on March 1, 1937, children enrolled numbering 14,750 and nurses 551. Attendants in elementary schools totalled 359,439, on March 1, 1937, with their teachers numbering 7,108. Middle schools and schools of the same grade totalled 79, with pupils numbering 64,244. Institutions for higher and university education were 10 in number, faculties totalling 793 and students 7,843.

Furthermore, there were on March 1, 1937, Young Men's Schools numbering

Digitized by Google

295 in all, with teaching forces of 2,419 and pupils counting 37,933.

Educational expenditure of the Municipality for 1936 was ¥21,219,000 an increase of ¥5,430,000 (34.4%) over 1935. Of this expenditure for education 39.1% was for salaries.

Universities and colleges in Osaka are the Osaka Imperial University (governmental), the Osaka University of Commerce (municipal), Osaka Higher School (governmental), the Osaka School of Foreign Languages (governmental), the Kansai University (private), Naniwa Commercial College (private), Osaka Girls' College (prefectural), etc. At the end of March, 1936 there were 13 libraries, 1 being under governmental maintenance, 6 under municipal maintenance and 6 of private ownership. In the governmental library there were 271,170 books on March 31, 1937.

Social Welfare Works

Relief of the Poor Since the issuance by the Government in 1874 of the relief regulation, the municipality of Osaka has active interest in the relief of the poor, old-aged and deserted children. More recently it has undertaken to institute various social works directed for the prevention of poverty. In 1936 three municipal maternity homes received 5,633 expectant mothers of small means and births numbering 4,616 were obtained, still-births numbering 330.

Protection of Infants & Children At the end of 1936 there were 40 nurseries, 12 poor children educational homes; 7 blind and deaf protection homes; 9 minors protection houses; and 16 children health consultation offices. Infants who were received in the 40 nurseries totalled 2,782.

Employment Exchanges The municipality also maintain 23 employment exchanges and 2 training place for work-seekers. The employment exchanges gave work to 42,224 men and 17,609 women during 1936.

Medical Relief On March 31, 1937 there were 60 relief hospitals. The total number of patients treated in all the relief-hospitals was 4,892,546 (out-patients) and 11,340 (in-patients) in 1936.

Social Education Work In 1936 there were 19 institutes for the social education work, of which 7 were under municipal management. Protection of infants and children, assistance to advice-seekers on matters of health, law, etc. and holding of necessary lectures for social educational purposes etc. are the works that are being carried on by the 19 institutes.

Unemployment In 1936 there were 28,105 unemployed per day in average including 7,328 Coreans, according to the Municipal Social Bureau. This unemployment number was 0.91% of the entire population of the city and a reduction of 14.2% from 1935. Though there was a reduction of 19.67% in Japanese there was an increase of 5.9% in the Corean unemployment.

Municipal Finance

The fiscal year 1938 budget was formulated, taking into consideration the need of meeting all that was urgent for the healthy expansion of the city and the promotion of the welfare of the citizens and it was balanced at ¥374,312,000, 0.4% increase over the previous year. The main items for which the expenditure was alloted cover the following: ¥152,314,000 for the city planning work; ¥65,098,000 for extension of equipment work for the supply of electricity; and ¥32,086,000 for the extension of water work.

The municipal loans aggregated ¥562,422,000 on May 31, 1937.

Kyoto

Kyoto, known in antiquity by the name of "Heian" (the city of peace), was for about a thousand years the metropolis of Japan. At the Restoration, the Emperor Meiji moved his capital to Tokyo, but Kyoto retained its position as a cultural centre, and today it is looked upon as "the classic city" and the leader of culture in the western part of the country. The city, lying in what is called the Kyoto basin, is surrounded by many famous hills and mountains such as Arashiyama, Atagoyama, Kuramayama, Hiéizan and Higashiyama. The area of the city is 288.65 square kilometres, the greatest length from N. to S. is a little over 26 kilometres and the greatest breadth is about 25 kilometres, the form being roughly rectangular. Osaka lies 43 kilometres to the southwest.

Boundaries The boundaries of the city have undergone considerable changes since 1888. At that date the first annexation of adjacent villages was made, a second extension was made in 1902 and a third in 1918. In 1929 three wards, Nakagyo-ku, Sakyo-ku, and Higashiya-

first Biwa Canal, completed in 1895 at the cost of ¥1,838,317, was designed for the conveyance of passengers and goods and for the supply of water power, while the second canal, completed lately at the cost of ¥4,477,805, supplies water for drinking, fire-brigades and for producing electricity, etc.

The waterworks were started in 1908 and completed in March, 1912, at the cost of ¥3,000,000 of which ¥750,000 came from the State treasury. The water is drawn from Lake Biwa by means of the second canal mentioned above and supplies water to 500,000 people. Further work, to cater to the needs of 200,000 people, is on the way. The supply in 1936-37 was 46,883,229 cubic metres to 154,667 households.

Education

Governmental and Prefectural: Kyoto Imperial University, the Third Higher School, Kyoto Higher Industrial and Art School, Kyoto Higher Sericultural School, Kyoto Sangyo Koshujo (School of Sericulture).

Municipal schools: Kyoto Painting School.

Private schools: Ritsumeikan University, Doshisha University, Ryukoku University, Otani University, Shingonshu University, Buddhist School, Military Arts School.

NUMBER OF EDUCATIONAL INSTITUTES

(March 1, 1937)

	No.	Instructors	Students
Kindergartens	50	180	4,484
Elementary schools	142	3,049	131,118
Blind, deaf and dumb schools	2	49	232
Girls' high schools	15	476	11,466
Middle schools	16	419	8,220
Technical schools	16	551	13,516
Normal schools	2	97	849
Higher schools	1	69	713
Colleges	16	691	6,411
Universities	6	995	9,790
Young People's schools	134	933	12,245
Miscelleneous schools	42	624	8,279
Total	442	8,133	207,323

Libraries and Museums There are also in Kyoto other institutions for educational purposes as the Imperial Gift Museum, Kyoto Municipal Library, Kyoto Fine Arts Museum, and the Memorial Zoological Garden.

Shrines and Temples In 1936 the numbers of Buddhist temples and Shinto shrines for which Kyoto is famous were 403 shrines, 334 preaching places of sectarian Shinto sects, 1,418 Buddhist temples, while Christian churches numbered 52.

Social Work

Conditions of social undertakings under municipal management in 1936-37 were:

	No. of establishments			
Public markets	13		Sales account	2,528,904
Housing	5	places	No. of houses	250
Public baths	6	houses	Bathers	1,670,330
Labour exchanges	3		Cases handled	44,620
			Employed	14,885
Lodging houses	1		Lodgers	28,169
Lunch-room	1		Meals	94,713

Finance

The annual revenue and expenditure, both general and special, of Kyoto amounted to:

Fiscal Year	Revenue (In ¥1,000)	Expenditure
1932-33	37,517	37,002
1933-34	26,083	36,302
1934-35	27,453	37,884
1935-36	28,527	42,869
1936-37	30,608	43,945
1937-38	45,187	49,753

Municipal debts outstanding on May 31, 1937 totalled ¥56,976,478 or ¥51.45 per capita of population.

Digitized by Google

ma-ku were newly added to the city. In 1931 the last annexation was made and two more wards, Ukyo-ku and Fushimi-ku, were constituted.

Population The population grew from 717,100 in 1927, to 736,000 in 1928, to 755,200 in 1929, and due to the above mentioned extensions in the boundaries, was found in 1930, to be 952,397. On October 1, 1935 the total number of population in Kyoto was 1,080,593, that of households was 224,663. The estimated number of population on October 1, 1937, was 1,133,900, and that of households was 235,700.

Industry and Commerce

In 1936 the conditions of factories in Kyoto were as follows:

	Factories	Operatives	Production (In yen)
Textile	1,157	33,450	88,171,441
Metallurgical	124	2,918	15,575,187

Miscellaneous	125	1,925	5,236,286
Total	2,300	60,124	203,402,425

TOTAL INDUSTRIAL PRODUCTION OF KYOTO
(1936)

Kind of Industry	Amount in yen
Agriculture	4,986,447
Livestock	4,828,597
Forestry	380,136
Mineral	247,559
Fisheries	50,313
Factries (including all petty shops)	305,131,031
Total	315,624,083
1935	298,761,715
1934	264,128,150

Foreign Trade Not being a port Kyoto cannot carry on trade with foreign countries direct except by parcel post, but the goods consigned to and from foreign countries through other ports were (in ¥1,000).

	1933	1934	1935	1936
Exports	28,270	38,984	42,490	37,272
Imports	5,315	8,198	9,528	8,443

Banking Statistics Figures concerning the banks in the city are quoted below:

(In ¥1,000)

At the end of	No. of Banks	Deposits	Loans
1932	88	453,702	156,344
1933	85	474,504	178,553
1934	80	494,295	208,386
1935	80	535,339	179,773
1936	71	680,692	185,964

Commercial and Industrial Corporations At the end of 1936 there were 2,954 companies in Kyoto. Their paid-up capital amounted to ¥314,140,000. The Kyoto Stock Exchange sold, in the short term section, 12,514,760 shares with the value of ¥1,406,988,000 and delivered 1,563,830 sares with the value of ¥138,711,000.

Transportation

Vehicles At the end of 1936 the number of vehicles was 226,244, including 198 rikisha, 2,851 automobiles and 161,099 bicycles.

Municipal Tramways In 1936-37 the total length of the lines was 66.7 km. and carried 105,993,731 passengers, while the bus ran on 54.7 km. of the lines and carried 12,657,538.

State Railways In 1936-37 the number of passengers who moved through Kyoto and other seven stations in the city was 21,346,437.

Suburban Electric Railways On the north the Eizan Electric Railway extends from Demachi Bridge to Kurama and Mount Hiéi; on the northwest the Arashiyama line starts Shijoomiya and goes to Arashiyama and connects with the Atago Electric line. To the south Kyoto is connected with Osaka and Nara by three electric railways, i.e. Kei-han Electric, Shin (new) Keihan Electric and Nara Electric. The Kei-han line extends to the east from the terminal of Sanjō to the city of Otsu by Lake Biwa.

Rivers, Water-Power Works

Rivers Almost all the rivers that meet in the Kyoto Basin, rise in the Tamba tableland. The Hozu River, which later changes its name into the Katsura River, touches the western side of the city; the Kamo River and the Takano River, rise in the southern part of the tableland, join together and flow across the city to empty into the Katsura River. The Uji River, starting from Lake Biwa, and the Katsura River meet in the southern suburbs of the city to form the Yodo River which flows south-westwards, through Osaka, into Osaka Bay.

Canal and Water-power Work The

Digitized by Google

In 1937, the turnover of the Stock Exchange was 122,400 shares long term transaction valued at ¥11,157,146. The Rice Exchange handled 29,100 koku (¥4,300,500) while the Cotton Yarn Exchange handled 3,155,480 bales.

Industry Commodities that are brought into city are foodstuffs and raw materials such as rice, sugar, timber, coal, ginned cotton, iron, wool, etc., while those sent out are mainly lumber, coal, cotton piecegoods, porcelain and pottery, beer, cement and other manufactures. Nagoya has been from olden times a famous place for porcelain and pottery and in 1937 the output totalled as much as ¥28,317,417. It is only since the growth of the cotton spinning industry in the city that the value of the annual output of pottery has been challenged. The total production of the cotton spinning industry reached ¥194,529,129 in 1937. An equally significant development is that of the machine and machinery. In 1937 the total output of machine industry reached ¥161,639,657, an increase of 47.1 per cent as compared with the previous year.

Number of Factories and Production Number of factories employing more than 5 operatives and productions of various industries in 1937 follow:

Kind of industries	Factories		Operatives		Output (in ¥1,000)	
	1936	1937	1936	1937	1936	1937
Textile	605	758	27,373	32,053	164,617	194,529

Transportation

Railways Lying as it does between Kyoto, the old capital, and Tokyo, the present capital, Nagoya is known as Chukyo (middle capital). It is an important intermediate city on the Tokaido highway. The Kwansai line, which starts from Osaka, passes through Nara and Miyé prefectures and connects at Nagoya with the main Tokaido line to Tokyo. The Chuo line, which runs through Gifu, Nagano, Yamanashi and other prefectures to Tokyo, has Nagoya as its other terminus. Nagoya is thus one of the most important railway centres of Japan. The railway station and the harbour are directly connected by rail and the importance of the city as a distributor of goods is thereby enhanced. There are 8 stations, viz., Nagoya, Nagoya-Minato, Atsuta, Chikusa, Ozoné, Hatta, Shiratori, and Horikawaguchi. The annual passenger traffic passing through these 8 stations is estimated at about fifteen million persons, and goods traffic amounts to approximately four million tons. The city is provided with an extensive network of electric railway lines to connect with outlying districts. Since 1935 the city bought several private electric railways, and now only two private ones are left, i. e. the Seto Electric Railway Co. and the Nagoyo Electric Railway Co., and most of electric car business is run by the municipality, the total mileage being 153,152 kilometres.

At the end of 1937 the total length of roads in Nagoya extended to 3,388 kilometres, the number of bridges 710, that of vehicles 191,395 in 1936 and 211,118 in 1937.

Harbour Works Nagoya has a splendid harbour well protected by Chita Peninsula from typhoons. Construction of the harbour was started in 1896 and the third stage of the entire plan was completed in 1928 after a total outlay of ¥15,490,000. The area of the wharves is 1.52 square kilometres, with anchoring space for thirty-eight steamers of ten thousand tons or so. The fourth stage of construction was undertaken at an estimated expenditure of ¥10,120,000. When the work is finished the area of the wharves will be increased to 2.23 square kilometres and there will be anchoring space for fifty-two steamers of ten thousand tons. At present direct trade is carried on with the American

continent, Europe, China, the South Sea Islands, Australia and Africa. The number of ships which entered the Nagoya harbour in 1937 was 54,491 with an aggregate tonnage of 16,316,390.

Education and Social Work

Social Work Social undertakings in the city in 1937-38, were as follows:

	Establishment	Beneficiaries
Lodging houses	7	152,291
Public pawnshops	5	Persons 53,195 Loans ¥266,080
Labour exchanges	10	Cases handled 433,411
Public markets	14	Amount of sale ¥2,920,157

Educational Facilities In March, 1938 the number of schools and pupils in Nagoya was 410 and 245,153 respectively classified as follows: 41 kindergartens with 3,949 children; 120 elementary schools with 165,233 pupils; 180 secondary schools including the young people's schools with 62,305 pupils; 7 collegiate schools including one university with 2,964 students, 2 blind and deaf-mute schools with 384 pupils; and 58 miscellaneous schools with 10,007 students.

Among the above mentioned schools those belonging to the municipality in 1936 were:

Kind of schools	No.	Classes	Instructors	Pupils
Elementary schools	109	2,686	2,977	6,530
Girls' high schools	3	—	85	2,676
Commercial schools	3	—	99	2,594
Technical school	1	—	40	605
Young peoples' schools	100	—	1,056	12,810
Business continuation schools	29	—	417	8,517
Kindergartens	4	23	24	687

Total educational expenditure including others ¥6,639,509

Finance

Revenue and Expenditure The annual revenue and expenditure of Nagoya city has shown a marked increase of late as it is clear by the following table:

Year	Revenue	Expenditure		
		Ordinary	Special	Total
	¥	¥	¥	¥
1928-29	19,438,161	11,663,553	7,275,835	18,939,388
1929-30	25,390,085	18,219,390	7,034,796	25,254,186
1930-31	31,477,355	23,545,976	6,878,659	30,424,635
1931-32	37,963,011	28,946,961	7,126,598	36,073,559
1932-33	45,421,218	36,644,010	7,163,058	43,807,068
1933-34	84,689,082	76,511,764	7,578,021	84,089,785
1934-35	35,894,410	25,738,008	10,156,402	35,894,410
1935-36	54,043,639	44,205,138	7,838,501	54,043,639
1936-37	66,689,000	25,639,000	41,050,000	66,689,000
1937-38	59,442,000	19,435,000	40,007,000	59,442,000

Municipal Loans At the end of March, 1938, the total indebtedness of Nagoya city amounted to ¥113,610 or ¥463.33 per capita of household.

Yokohama

General

History Yokohama, in the Bunroku Era, about 1587, was a hamlet of twelve families and by the time it became an open port, July 1, 1859, it was only a small fishing village of one hundred families or 350 people. The real growth

Digitized by Google

began with the arrival of the foreigners. The commercial treaties Japan entered into with the United States of America, the Netherlands, Russia, Great Britain, and France stipulated that Kanagawa should be an open port, because it stood on the open harbour nearest Tokyo, then known as Yedo and the seat of the Shogunate Government, but as that village was already very crowded the Tokugawa Shogunate opened up the village of Yokohama instead.

In the beginning four streets were laid out, but as more and more Western, Chinese and Japanese merchants gathered there the area was quickly extended. The population in 1877 was 30,000, five years later it had grown to 52,000, and five years after that there were more than 94,000 in the town. At the end of September, 1932, the population was 661,500. Yokohama received the status of a municipality on April 1, 1889. In 1901, the once thriving port of Kanagawa and other adjoining villages and towns were absorbed by the newly risen Yokohama, and in 1911 and 1927, further extensions took place.

Quake and Rehabilitation Yokohama and suburbs suffered severely in the great earthquake and fire which occurred on September 1, 1923. Practically the whole town was reduced to ruins and ashes, but with the untiring efforts of its citizens, together with generous support from outside, the reconstruction of the town was completed, as originally planned, within six years of the disaster. On April 22, 1929, His Majesty the Emperor honoured the city with a visit of inspection, and the following day the municipality celebrated the completion of its programme of reconstruction which, in truth, was the creation of a new city out of a pile of cinders.

On April 1, 1927, two adjoining towns and seven villages, with a population of 115,757, were annexed to the municipality, and on October 1 of the same year the whole city was re-divided into five wards; Tsurumi, Kanagawa, Naka, Hodogaya and Isogo. By that time the construction of the gigantic breakwaters, the reclamation at Namamugi and Koyasu and the extension of the waterworks was completed, and the perpetual land leases were being bought back by the municipality one after another.

Location Yokohama is situated in the south-eastern part of Honshu, the main island of Japan, on the western shore of the Bay of Tokyo about 22 miles from the entrance to the bay, in latitude 35° 27′ N., longitude 139° 38′ E. It is the seat of government of Kanagawa prefecture, of which it is also the largest population centre. It is surrounded by hills on which the better class residential districts are located.

Climate Yokohama's location on the Bay of Tokyo serves to modify the heat of summer, the nights being generally cool and comfortable. In the summer months there is an absence of rainfall. Rain is most abundant in June and September, the two rainy seasons of the year, at which times the humidity is trying, but never so bad that the climate is unbearable. In winter the sky is clear and the atmosphere crisp and invigorating. In February there is a short season of damp cold during which there are occasional snowfalls. From March spring begins, with bright sunny days and frequent strong winds. During the summer months typhoons are to be expected, but Yokohama harbour is protected from their violence.

Area and Population At the end of March, 1937 the area of Yokohama was 173.18 square kilometres. The population of Yokohama was 777,500 on October 1, 1938, of which 395,800 were male and 381,700 female.

Industries

Factories and Production At the end of 1936 there were 152 factories for the spinning industry, 61 for the metallic industry, 169 for the machine and tool manufacturing industry and 75 for the chemical industry, all showing expansion compared with 1935, the most conspicuous one being the machine and tool which increased from 107 to 169. Both the number of workers and the amount of production also showed a corresponding increase, workers increasing from 47,625 to 57,600 and production from ¥374,409,880 to ¥433,616,100, an increase of 16 per cent.

At the end of 1936, the density of the population average was 99.9 per square kilometre, ranging from 186.7 in the thickly inhabited south-west to 40.0 in the north-east. The average is 81 per square kilometre less than in Japan proper.

Origin of the Korean Race

Though no conclusive opinion has ever been given as to the origin of the Korean people, it is evident that they are of the Mongolian family, and it is generally admitted that their cradle was in the neighbourhood of Changchun, Manchoukuo, in and around the place now called Petna on the River Sungari. It seems, therefore, but natural that they should have a profound liking to emigrate and settle in those parts of Manchoukuo. From various historic relics it appears that they were of the same stock with the Manchurians and those Japanese dwelling in the western half of Japan. In course of time much intermingling of blood seems to have taken place among the Koreans and the Chinese ever since Chinese colonies were first established along the north-western coast. But the latter did not supersede the native Korean race to any appreciable degree. This is clearly seen from the fact that the two races today have a distinctly different facial appearance, though both alike have black straight hair, dark oblique eyes and a tinge of bronze in the skin. The Korean language belongs to the Turanian group; it is poly-syllabic and possesses an alphabet of 11 vowels and 14 consonants, and a script known as Eunmonn. In grammatical construction it is almost identical with Japanese, though in sound and vocabulary it is quite dissimilar. From all these and other facts and evidences it may be concluded beyond any doubt that these two peoples were closely related to each other from very remote times.

Administrative Organization

Chosen is administered by the Government-General which was inaugurated on August 29, 1910, and has 8 main administrative offices, viz., (1) Governor-General's Secretariat, (2) Home Affairs Bureau, (3) Financial Affairs Bureau, (4) Industrial Bureau, (5) Agricultural and Forestry Bureau, (6) Judicial Bureau, (7) Educational Bureau, and (8) Police Bureau. There are also many affiliated offices such as (1) Central Council, (2) Communications Bureau, (3) Railway Bureau, (4) Monopoly Bureau, (5) Provincial Office, (6) Custom House, etc.

Position of Koreans For a number of years since the establishment of the Government-General in Chosen all Koreans in government service were placed under different regulations from those applying to Japanese officials. Gradually, however, almost all discriminative features in treatment and salary have been wiped out and in October, 1919, Korean officials were finally placed on the same footing as the Japanese and came under the same regulations. Moreover, prior to March, 1920, in the courts Korean judges were allowed to try only those civil cases in which both parties were Koreans and the

Opium Owing to the strict control of the Government-General the number of opium smokers has in recent years greatly decreased, but at the same time the number of those indulging in morphine-injection has increased. The use of morphine has of course been prohibited by the government, but owing to the activity of cunning dealers all the efforts of the government to put an end to it have been fruitless. The government thereupon has come to the decision to monopolize the manufacture and sale of morphine so as more effectively to control the spread of its use. Accordingly, in March, 1933, the government's manufacture of morphine was started at Keijo, its production being sold to certain designated pharmacies to be used for medical purposes only, and in 1937 no morphine for opium smokers was produced.

MORPHINE MANUFACTURE IN 1937

Raw opium	27,608 kg.
Manufacture	
Morphine (salt)	0
Diacethyl morphine (salt)	0
Opium for medical use	63,760 g.
Total	63,760 g.
Sale	
Morphine (salt)	53,775 g.
Diacethyl morphine (salt)	3,120 g.
Opium for medical use	51,535 g.
Total	108,430 g.

Economic Progress

The following table shows the progress during recent three years as compared with the conditions in 1910.

	1936	1935	1934	1933
		(In thousand of yen)		
Paid up Capital of Corporations:	663,569	527,048	445,229	15,909
Value of Agricultural Products	1,208,910	1,147,050	1,020,150	157,158
Value of Forest products	118,065	114,005	106,030	19,240
,, Marine products	79,879	65,966	57,798	8,466

Wage Index (Average in Keijo)	161.15	152.46	149.46	100.00

Overseas Trade

Prior to its annexation by Japan the overseas trade of Korea amounted to about 50 millions of yen a year. Now it is approximately put at ¥1,355,000,000 as per figures for 1936 show. The following figures indicate its developments :

OVERSEAS TRADE

Year	Exports (¥ 1,000) Foreign countries	Japan	Total	Imports (¥ 1,000) Foreign Countries	Japan	Total
1912	5,616	15,369	20,985	26,359	40,753	67,112
1917	20,236	64,726	84,962	31,396	72,696	104,092

Banking

Banking on a modern system was first introduced into Chosen in 1878 when the Dai Ichi Ginko of Tokyo established a branch office at Fusan. Later on, the Juhachi Ginko of Nagasaki opened branches at Jinsen and Gensan. After the China-Japan War these banks opened their branches in Keijo and other centres, while two native banks, the Chon-il (later renamed the Korean Commercial) and the Hansong, came into being in Keijo.

In 1902 the Dai Ichi Ginko was authorized to issue bank notes for circulation within Chosen. In 1906, to promote economic development in the provinces, agricultural and industrial banks were formed in several of the principal towns, the Government taking shares in them or granting them loans free of interest, and in the same year a third native bank called the Han-il was founded in Keijo.

In 1909 the Bank of Korea capitalized at ¥10,000,000 was founded in Keijo as a de jure central institution, and to it was transferred all the functions belonging to a central bank hitherto performed by the Dai Ichi Ginko. After the Annexation the bank was renamed the Bank of Chosen and branches were opened by it one after another in important places. Nor was its sphere of activity confined to the peninsula, for many branches were opened in Manchuria where it enjoyed free circulation of its notes, and its activity even penetrated North China and East Siberia. The Bank also made loans to China, and opened an agency in New York with a view to facilitating exchange operations and to utilizing the American money market for the development of Chosen and Manchuria. Stimulated by the steady expansion of its business, the Bank increased its capital to ¥40,000,000 in 1918, and to ¥80,000,000 in 1920, while authority was given to increase its maximum limit of note issue as occasion demanded; but owing to continued business depression the Bank suffered severe losses and was compelled in 1925 to reduce its capital by one-half. (See Chapter IX, the Bank of Chosen.)

Since then, encouraged by the economic development in general, and especially influenced by the war-time boom, many local banks were established in the country. During this time, however, the agricultural and industrial banks in existence were found much too weak to cope with the increasing demand for funds, their capital all told being only ¥2,600,000, so in 1918 they were all merged into the Industrial Bank of Chosen under special government protection, with a capital of ¥10,000,000, which has since been increased to ¥40,000,000.

The first clearing house was opened in 1910, and banks in Keijo became its members. Later additional clearing houses were established in Jinsen (Chemulpo) and other large commercial centres—the total number being nine at the present time.

In 1911 there were in Chosen 11 banks with 59 branches. The total aggregate capital was then ¥12,350,000, with total reserve funds amounting to ¥366,000 and the deposits totalling ¥18,335,000. At the end of 1937 the number of banks was 10, together with branch offices of 3 banks in Japan proper. The following gives a more detailed account of the 10 banks:

	1925	1930	1933	1934	1935	1936
			(¥ 1,000)			
Capital subscribed	102,275	101,425	101,075	100,675	99,175	99,175
Capital paid-in	58,850	60,991	61,871	61,731	65,912	65,981
Reserve funds	7,024	14,464	21,358	22,673	23,829	27,276
Deposits	217,597	226,563	458,159	567,754	609,028	386,191
Loans	429,361	457,557	730,614	1,047,339	1,013,146	712,380

The banking institution which is utilized most by the Korean masses is the Post Office Savings Bank. In 1921 there were about one million and a half depositors at this bank, their aggregate deposits reaching ¥18,726,338. In 1936 the number of depositors increased to 3,861,105, with the aggregate deposits expanding to ¥60,422,961. The following figures show the annual expansion:

March, 31	Number of depositors	Amount (yen)
1922	1,416,325	18,726,338
1923	1,590,470	19,875,093
1924	1,694,087	21,040,342
1925	1,606,740	21,029,849
1926	1,711,590	21,531,122
1927	1,795,858	22,466,126
1928	1,910,289	26,961,217
1929	2,023,977	30,787,502

1937	3,861,105	60,422,961

Local Credit Associations Local credit associations were first organized in 1907 by virtue of the Local Credit Association Regulations promulgated in the same year. The object of the organizations is to assist the Agricultural and Industrial Banks in the capacity of their auxiliaries, accommodate small Korean farmers with funds, and look after their interests in several other ways so as to ensure a healthy development of agriculture. Membership is confined to those who engage in agriculture, and each association is organized as a corporate juridical person. The Government endows each association with ¥10,000 as foundation fund or grants subsidy to encourage its development.

Principal business of the associations is to loan funds to the members, and store crops for them. In addition they distribute and loan seeds, seedlings, and fertilizers to their members, and also undertake consignment sales of products for the members.

At the end of 1936, there were 709 associations with 1,563,391 members and an aggregate paid capital of ¥12,462,000. The progress of these associations is illustrated in the table below.

Year	Associations	Members	Paid up capital	Deposit (in ¥1,000)	Advance (in ¥1,000)	Reserve fund	Government grant
1926-27	547	446,576	6,510	54,505	76,082	8,144	3,417

1936-37	709	1,563,391	12,462	162,355	228,464	20,809	4,217

Agriculture

Chosen, though mountainous, is essentially an agricultural country. In 1937, more than 71 per cent of its entire population was engaged in agricultural pursuits. Though the soil is not very fertile, it is sufficiently so to produce enough foodstuffs to support its entire population.

In 1910, the year of annexation, the value of production scarcely reached ¥250,000,000, but in 1930 it more than doubled the above figure. Of all agricultural produce rice is the most important, production in 1937 reaching 26,796,950 koku and 7,432,426 koku of which was exported bringing in ¥232,473,877.

Grains In 1910 the rice fields covered a total area of 1,350,000 cho, yielding 10,400,000 koku, which rose in 1937 to 1,639,116 cho and 26,796,950 koku, its export during the same period increasing from 798,000 koku to 7,430,000 koku. This wonderful development has been achieved by the improvement made in cultivation, in the selection of seeds and manure, and in irrigation and reclamation. Next in importance come barley, wheat and rye, which are, however, mostly cultivated for home consumption. In almost every province these grains are raised in the paddy fields, after the rice crop is harvested, production of these in 1937 being 9,795,330, 2,020,875 and 2,771,878 koku respectively. Owing to the help in various ways given by the authorities to aid in the cultivation of these three cereals, their production has been on the increase year after year. Third in importance comes soy bean. In earlier times it was far from being an important produce owing to ignorance on the part of Korean farmers of the proper method of preparation, such as drying and assorting. It is now, however, in high esteem on the Japanese market where there is a demand for it not only as food, but for chemical industrial purposes, and thus the amount exported to Japan is yearly on the increase. In 1937 the total area under cultivation was 785,416 cho and the amount produced reached 4,262,688

Digitized by Google

koku, and 1,150,000 koku of which was exported for ¥23,350,000. German millet is for most Koreans what rice is for the Japanese people. They depend more upon it than upon rice on account of its cheapness in price. The Korean farmers sell their rice, but use their millet crops for their daily diet, so that the supply of the grain hardly suffices to meet the entire demands of the Korean people. In 1937, the native production of the grain reached 5,840,088 koku, and its imports 790,000 koku valued at ¥14,950,000.

Cotton Cotton is another important agricultural produce in modern Chosen. The present scale of its growth is owing to the encouragement given by the Government-General. It was in 1906 that the first trial plantation of American cotton was carried out in the neighbourhood of Moppo. As its superiority over the old native cotton was sufficiently demonstrated, soon its cultivation was vigorously encouraged in all parts of southern Korea, so that the cotton acreage was increased from 1,200 cho in 1910 to 175,059 cho in 1937, and the crop expanded from 660,000kin in 1910 to 200,420,292 kin in 1937. If the production of the native plant is added, the total cotton production in 1937 amounted to 240,288,464 kin from the total area of 223,171 cho, as against 21,000,000 kin from 60,000 cho, in 1910.

Fruit Farming Fruit farming has also become a thriving industry of the erstwhile hermit kingdom. Soil and climate alike are suitable, especially for the growing of apples, and the government authorities are extending their assistance in this direction likewise, with the object of improving the quality of the fruit and gaining for it a world-wide market.

Many new varieties of apple, superior to the old native ones, are now cultivated, the quality being in some cases better than that of the fruit grown in Japan, the 1936 production reaching as much as 15,790,000 kwan, followed by pear 3,630,000 kwan and grapes 390,000 kwan.

Sericulture By 1910 the Government-General had done everything in its power to improve the native methods of cultivating the mulberry trees and raising silk-worms after the Japanese fashion. In 1919 a new system was instituted for carrying on a compulsory examination of egg-cards and for giving adequate care to the growing of good mulberry trees. All this paternal care and effort on the part of the Government-General for the advancement of the economic welfare of the Korean farmer was by no means thrown away. In 1910 the cocoon production was 14,000 koku and the number of households engaged in the work was figured at 76,000. In 1937 the number of households was 815,278 and the output was 722,300 koku. The production of raw silk amounted to 1,909,944 kg. valued at ¥20,712,153.

Stock Farming As Korean beef is very palatable, the demand for it is rapidly increasing in Japan and Manchoukuo as well as in Siberia. In 1910 the cattle in all Chosen numbered only 700,000 head, which in 1937 increased to 1,713,000. The export of cattle and hides totals from ¥5,000,000 to ¥8,000,000 a year. The raising of both pigs and poultry has been greatly encouraged by importing from Japan animals and birds of superior quality, with the result that in 1937 the former totalled 1,625,000 and the latter 7,221,000, both more than doubling the numbers found in 1910. Sheep were unknown in the old days in Chosen. Efforts were made since 1919 to raise them but the results were not satisfactory. Since, however, it is of great importance to make Japan self-sufficient in respect to supply of wool a new plan for encouragement of sheep was formed in 1934. Carriedale, which is suited to the climate and soil of Korea, has been decided upon as the kind to be raised in Korea. Subvention will be given to private undertakings, and the national sheep breeding grazing ground has been located at Ama, Meisen county of North Kankyo Province. In 1937 the number of sheep reached 19,627.

Conditions of Farm Households In 1937, the total number of the farming households in Chosen was 3,058,755, which consisted of 549,585 landed ones, 737,782 semi-landed, 1,581,428 tenanted, 72,919 "fire field," and 27,041 hired; divided into nationalities as 3,049,019 Korean households, 7,637 Japanese, 2,098 Manchoukuoan and Chinese and 1 white. The type and size of farm households in Chosen vary to a large extent. The average size of farm land is about one cho six tan (about four acres), which is larger than the average in Japan proper where the size is just over one cho (2½ acres). However, in Chosen, due to poor methods of cultivation, the yield per tan is only slightly over one koku (5 bushels) while it is two koku in Japan. Supplementary products are as yet hardly worth mentioning. The large ownership of farm land by a few landlords is one of the roots of the difficulties. The majority of farming population

Digitized by Google

versal plantation of trees is encouraged throughout Chosen. In short, in the past twenty years more than a million cho have been planted with over 4,800,000,000 trees, and thus the mountain scenery in every part of Chosen is steadily undergoing a change with the accompanying effect of diminishing floods. The value of the timber and lumber sold by the Government-General in 1936 amounted to ¥8,812,592, that of timber in 1937 ¥4,821,904.

The Forest Districts There are several forest districts which escaped the almost wholesale denudation by kadenmin before 1910, the most important of which is the forest along the upper reaches of the Yalu and Tumen Rivers on the frontier. In 1906 the first systematic exploitation of the region was conducted by a joint undertaking organized by Japanese and Koreans and assisted by both the Korean and the Japanese governments with a capital of ¥1,200,000. This, combined with a similar enterprise financed by a group of Japanese and Chinese industrialists, forms one of the largest timber-supplies in the world. Since 1932, the government started the work of developing these forests with an expenditure of ¥12,183,000 to be operative for 15 years. The work consists of (1) development and utilization of forests, (2) education of kadenmin, and (3) protection of the forests.

Fisheries

Since 1910 all sorts of encouragement have been given to the Korean fishermen for the development of the fishery industry in Chosen, with the result that improvements in one way or another have been introduced in the building of fishing-boats and in the method of catching. Thus, while before 1910 the total value of catches was only about ¥8,000,000 a year, by 1937 it increased to ¥69,920,000, and other aquatic products in the meantime advanced from 2,650,000 to ¥93,440,000. The first fishery law in Chosen was issued in 1909, and this was replaced three years later by a new law providing for the definite establishment of fishing rights over a certain area of waters, the prohibition of certain actions harmful to fishing in specified areas and the prevention of individual monopolization of any fishing area. Trawling within special zones was also prohibited, and certain restrictions were made to the number of whaling-boats and to the diving apparatus carried. Mention should be made in this connection of famous "hanyo" (woman divers) of Quelpart Island. There are 7,000 of these women and they are engaged in catching sea-ears and many kind of shellfish, and gathering laver and other sea-weeds by diving into the deep sea. The total earnings of these women amount to one million yen a year.

The following shows the marine products for two years, 1936 and 1937, the value of each of which exceeds ¥2,000,000 :

Kind	1936 Value	1937 Value
	(In yen)	
Mackerel	4,780,815	6,023,216
Sardine	26,811,275	34,193,809
Sciaena	4,754,776	4,763,537
Herring	3,000,075	2,682,093
Hair-tail	2,201,312	2,541,259
Shrimps	2,552,237	2,123,950
Mintai (Alaska pollack)	5,769,259	6,483,059

Besides these, there are sea-bream, plaice, cod, isinglass, yellow-tail, glue, shark, grey, mullet, rays, oyster, sea-eel, conger-eel, etc., valued each at between ¥500,000 and ¥2,000,000. The important manufactures of sea products in 1937 were sardine-oil ¥26,784,416, sardine-cake ¥25,433,439, dried mintal ¥5,240,732, and dried laver ¥3,922,515.

Mining

The present mining law, enacted in 1916, provides that mining rights can be granted only to Japanese citizens or to legal corporations under the Japanese law, and mining rights are treated as a form of real estate. As for mining rights secured by foreign citizens under the old régime, they are well respected. Of all minerals produced in Chosen gold occupies by far the most important position, the largest gold mine being the Unsan Mine operated by an American syndicate called the Oriental Consolidated Mining Company. Next in importance are the Shojo Mine worked by Frenchmen, the Suian Mine by Englishmen, and Sansei and Koyo Mines by Japanese. Formerly the mining industry in Chosen was carried on in a very primitive way except in those mines operated by foreign concerns. Soon after Chosen had been brought under Japanese protectorate rule in 1906 the Government tried hard to induce Japanese capitalists to invest capital in the mining industry of Chosen, but it was only in 1910 that Japanese capitalists began to display their energies in that lucrative undertaking. As, however, most of the more promis-

Digitized by Google

ing gold fields were already under operation by foreign capitalists, Japanese capitalists turned their attention to the exploitation of other minerals such as iron and coal. Iron ores in Korea hitherto found were mostly of hematite and limonite, the former being found in South Kankyo and Kokai provinces and the mixture of the two in South Heian and Kokai provinces. The amount of these ores stored, the purity of which is about 50 per cent, is estimated at about 20,000,000 metric tons. In 1933 about 570,000 metric tons of these ores were mined, of which about 394,000 metric tons were sent to the Kenjiho Iron Works and the balance of 176,000 metric tons to Japan proper. Fortunately a much greater store of magnesite ores is found in North Kankyo province. The purity of these magnesite ores is about 40 per cent on average.

As regards coal, almost unlimited quantity of brown and anthracite coals are stored in Korea, the quantity of the latter stored being especially large. Anthracite is mostly produced in the Heijo coal-field, and in South Kankyo, North Keisho and South Zenra provinces.

It must be mentioned that in Chosen nearly all kinds of minerals except sulphur, petroleum and asphalt are found in appreciable quantities, gold, coal, and iron preponderating. The following shows the value of the mineral products of Chosen :

MINERAL PRODUCTION

(In 1,000 yen)

	1911	1921	1932	1933	1934	1935	1936
Gold	3,744	2,992	17,809	26,066	33,214	38,320	49,909

Steel	—	—	—	—	4,178	6,764	6,533
Others	21	374	487	961	1,111	1,636	2,212
Total	6,069	15,767	33,746	48,301	69,172	88,039	110,503

Manufacturing Industry

It is only since 1916 that there has been any manufacturing industry worthy of the name in Chosen, and in 1937 the total value of manufactures reached ¥959,300,000, being over 31 times as large as that in 1911, in which year the total output was valued at ¥30,000,000. As the land has abundance of materials and a good labour supply, Chosen may be looked upon as a promising land for the future expansion of various industries. In 1911 there were in all the land only 252 manufacturing plants employing about 14,575 workers, but in 1936 the number of factories was 5,927 and the total number of employees 188,250.

Total of industrial production of Chosen for the year 1937 was as follows:

INDUSTRIAL PRODUCTION FOR 1937.

(In 1,000 yen)

Textile industry	141,150
Metallic industry	50,760
Machinery and tools	16,560
Ceramics	25,070
Chemical industry	304,940
Wood works	11,730
Printing and book binding	16,300
Gas and electric	40,070
Foodstuffs	238,030
Others	114,650
Total	959,260

Of the total 959 million yen ¥260,210,-000 was the production by the so-called household industries, outside factories managed by industrial companies or

Digitized by Google

where more than five operatives are employed.

Justice and Police

Chosen has now a judicial system similar to that of Japan. That is to say, in addition to the supreme court there are courts of appeal and local courts, the last-named having detached and sub-detached courts widely located. Both civil and criminal cases are first tried by local courts, while appeals against the decisions of local courts are made to the courts of appeal. The supreme court handles those appeals made against judgements rendered by the local courts or complaints against decisions or orders rendered in the second instance by the courts of appeal. Grave crimes of one sort or another have greatly diminished owing to the improvement in the work of maintenance of order and security. On the other hand, what might be called intellectual crimes such as fraud, forgery, and perjury have yearly increased. Prior to the establishment of the Japanese administration flogging was a common form of punishment. In 1912 its application to aged persons, women and children was prohibited, and in 1920 it was finally abolished as it was unsuited to modern ideas of penology.

Police The police service in Chosen had been under Japan's direction for some years even prior to the establishment of Japan's protectorate in 1906. But the system which had been in force at that period proved unsatisfactory. Accordingly, in June, 1910, a new system was introduced by which the commander-in-chief of the military police was appointed chief of police, and gendarmes and civil policemen were separately stationed as local needs required. In 1919, however, that semi-militaristic police system was displaced by the one now in force. This new and present police system is modelled on that in Japan proper, with its headquarters entrusted with the entire administration of police and sanitary affairs. The police force in 1937 was 20,643.

CRIMINAL CASES

		1934	1935	1936

	Arrests	11,644	11,680	12,628
Others	Cases	99,194	100,791	95,011
	Arrests	99,549	100,914	93,906
Total	Cases	195,025	199,720	197,404
	Arrests	186,754	188,170	181,267

Education

In the old days Korean children were taught in school nothing but Chinese writing and classics, but soon after the new régime was introduced they began to receive a more modern education, with such new subjects as arithmetic, geography and the Japanese language. The parents at first objected to the introduction of these revolutionary methods, and specially to the forcible teaching of the Japanese language, believing that this was a deliberate attempt on the part of the government to deprive the Korean children of their national and inherited traditions. It was due to this misconception held widely among the Korean people that the educational authorities found much difficulty in enrolling pupils despite the fact that no tuition was charged and all textbooks were supplied to the pupils free of charge. In 1930 the Government-General, animated by a desire to respect the wishes of the native race and to foster oriental morals developed by Confucius, reopened the old Meiringaku-in (Confusian Institute) at the Keigaku-in (formerly known to Koreans as the "Songkyun Kwan."), the oldest and highest seat of learning in the country for the study of the Confucian classics.

Important Reforms But many more reforms of far-reaching importance were made in 1920, when the present educational system was introduced. By it not only was the standard of educational attainment raised, but the principle of

Digitized by Google

equality was laid down firmly though no compulsory features were adopted with regard to elementary education, as in Japan. The following differences, however, were made and are maintained out of respect for Korean sentiment.

(1) The Korean language is made an obligatory subject in schools for Korean children exclusively, while it is optional in schools for Japanese children in Chosen.

(2) The teaching of Korean history and geography is to be particularly emphasized in schools for Korean children.

(3) Different text-books, though of an equal standard, may be used in view of the difference of language and customs of the two races. That is to say, schools for Japanese children may use text-books compiled by the Education Department of Japan, but schools for Korean children those compiled at the Education Bureau of the Government-General. Koreans are mostly educated in common schools, higher common schools and girls' common schools. The term of the Common school is six years while that of the higher and girls' higher common school is two years. Korean children who prefer to receive education at the Japanese school may enter the elementary or the middle school as they chose. The system proved very efficacious in developing the education in Korea. With the gradual increase of elementary schools more teachers, especially women, are in demand; therefore in April 1935 the Keizyo Women's Normal School was established, and the training course at the Keizyo Normal School was closed.

In April 1936 a new Government Normal School was established in Zensyu, and in April 1937 the Kanko Normal School was opened.

In the following table comparison is made of the education organs existing at the time of annexation and those of to-day. While there was only 100 common schools before 1910, they number now 2,601 with 901,182 pupils. The table below shows clearly the development of educational work in Chosen since 1935:

	1935		1936		1937	
	Schools	Students	Schools	Students	Schools	Students
Elementary schools	451	84,395	501	86,775	505	89,881
Common schools	2,362	720,757	2,504	802,976	2,509	861,389
Middle schools	12	6,715	15	7,124	16	7,778
Higher common schools	26	14,504	27	14,982	27	15,629
Girls' high schools	28	10,525	28	11,173	30	11,924
Girls' higher common schools	19	6,047	20	6,514	22	7,148
Normal schools	4	2,434	5	3,172	6	3,758
Business schools	63	17,072	67	18,264	72	20,323
Elementary industrial schools	97	4,163	116	5,942	125	6,325
Colleges	15	4,501	15	4,250	15	3,986
University preparatory schools	1	309	1	448	1	461
University	1	621	1	542	1	516
Others and total	3,079	872,043	4,440	1,087,387	4,740	1,211,449

Christian mission and other private schools are included in this table.

There are still a large number of Sohtang, which are old fashioned Chinese style schools where Chinese classics and brush-writing are taught. At the end of May, 1937, the number was 5,944 with 169,999 pupils. These schools are now utilized by the Government as agencies to foster public education and are controlled by regulations on Sohtang.

Short Course Elementary School Two million Korean children of school age are still unable to attend school, most of them living in remote agricultural and mountainous districts where it is not yet possible to provide educational facilities. To give some education to these children the Government introduced a plan to establish short course elementary schools with a two year course, which was put into force in April, 1934. The plan has been very popular in the country districts and the number of these schools established was very great. In 1937 they numbered 927 with 60,077 pupils.

Korean Students in Japan The Korean students in Japan proper numbered 7,589 in October, 1937, most of them being in Tokyo. Those sent by the Government-General are comparatively few. The students sent by the Government-General are not only supplied with necessary funds by the

Digitized by Google

where more than five operatives are employed.

Justice and Police

Chosen has now a judicial system similar to that of Japan. That is to say, in addition to the supreme court there are courts of appeal and local courts, the last-named having detached and sub-detached courts widely located. Both civil and criminal cases are first tried by local courts, while appeals against the decisions of local courts are made to the courts of appeal. The supreme court handles those appeals made against judgements rendered by the local courts or complaints against decisions or orders rendered in the second instance by the courts of appeal. Grave crimes of one sort or another have greatly diminished owing to the improvement in the work of maintenance of order and security. On the other hand, what might be called intellectual crimes such as fraud, forgery, and perjury have yearly increased. Prior to the establishment of the Japanese administration flogging was a common form of punishment. In 1912 its application to aged persons, women and children was prohibited, and in 1920 it was finally abolished as it was unsuited to modern ideas of penology.

Police The police service in Chosen had been under Japan's direction for some years even prior to the establishment of Japan's protectorate in 1906. But the system which had been in force at that period proved unsatisfactory. Accordingly, in June, 1910, a new system was introduced by which the commander-in-chief of the military police was appointed chief of police, and gendarmes and civil policemen were separately stationed as local needs required. In 1919, however, that semi-militaristic police system was displaced by the one now in force. Others and total	3,079	872,043	4,440	1,087,387	4,740	1,211,449

Christian mission and other private schools are included in this table.

There are still a large number of Sohtang, which are old fashioned Chinese style schools where Chinese classics and brush-writing are taught. At the end of May, 1937, the number was 5,944 with 169,999 pupils. These schools are now utilized by the Government as agencies to foster public education and are controlled by regulations on Sohtang.

Short Course Elementary School Two million Korean children of school age are still unable to attend school, most of them living in remote agricultural and mountainous districts where it is not yet possible to provide educational facilities. To give some education to these children the Government introduced a plan to establish short course elementary schools with a two year course, which was put into force in April, 1934. The plan has been very popular in the country districts and the number of these schools established was very great. In 1937 they numbered 927 with 60,077 pupils.

Korean Students in Japan The Korean students in Japan proper numbered 7,589 in October, 1937, most of them being in Tokyo. Those sent by the Government-General are comparatively few. The students sent by the Government-General are not only supplied with necessary funds by the

Digitized by Google

Government during the period they stay in the colleges to which they have been sent, but are on graduation given official or educational positions.

Reform in 1938 In view of the advance of Korean education in recent years and the advisability of raising the position of the educated Koreans to the same standard with the Japanese, the Government-General of Chosen made a general revision of the Chosen Education Law in March, 1938, according to which all the people in Chosen, Koreans and Japanese alike, are educated in elementary and secondary schools just as in Japan proper, and the former differences in courses of study between Koreans and Japanese were altogether wiped out.

Koreans for Defence Service

Chosen has been defended by the Chosen Army which solely consisted of Japanese officials and soldiers. But the present China Affair gave Koreans an opportunity to show their loyalty to the Government-General and the Emperor, and their earnestness in requesting their share in defence services and in other relative works has been much appreciated by the authorities and the people of Japan in general. And to comply with the request an Imperial Ordinance was promulgated in March, 1938, according to which Koreans are allowed, for the first time, to enter military service as volunteers.

The Chosen Government-General announced, in April, to receive 400 Korean volunteers, for which as many as 3,000 Korean young men immediately responded. The required number was chosen from among the three thousand and 200 of which were first enlisted as military students in the Chosen Government-General Institute for Training Military Volunteers, which was established near Keijo, the capital. They were graduated from the Institute at the end of November, 1938, after 6 months training to be the pioneer Korean constituent in the Imperial Army.

Religion

Buddhism Buddhism first entered Korea about 370 A.D. It was introduced from China by a priest who brought with him a Buddhist image and the "sacred books", and it flourished greatly in the peninsula during the days of Silla and Koryu. Under the dynasty of Yi, however, it met with persecution. The number of priests was limited and members of good families were forbidden to enter the priesthood, with the consequence that it soon lost its hold among the masses to a large extent. Things remained so until Japan extended her rule throughout the country. Then in September, 1911, an ordinance on religions was promulgated giving freedom of preaching and full protection to temples, and also raising the status of the priesthood. Since then Buddhism has been revived to a marked extent, so that there were, at the end of 1937, 1,615 temples and preaching places, 6,648 monks and nuns and 194,100 Korean adherents. There are several native religions not recognized by the Government-General, among which the most influential one is the Tendokyo, which in nature is a mixture of Confucianism, Buddhism and Taoism. This religion has followers numbering 82,200. Apart from Korean Buddhism and allied sects, we find Japanese forms of Buddhism lately established in the peninsula, priests of the Shin sect being the pioneers. Later three others, Jodo, Soto and Nichiren sects, entered the new religious field in competition with other sects and religions. At present nine sects of Japanese Buddhism are working among the resident Japanese as well as among the Korean masses, and at the end of 1937 there were 122 temples, 567 preaching houses, 767 priests, and 303,700 believers including 15,400 Koreans.

Shintoism At the end of 1937 there were in Chosen 53 Shinto shrines, while 10 Shinto sects had 318 preaching halls, 571 priests and 104,600 adherents including 18,000 Koreans.

Christianity Christianity in Chosen was first brought by an official mission sent to Peking, China, by a Korean king in the latter half of the 18th century. This mission brought back with them a Bible and other Christian books. As its teaching, however, ran counter to the deep-rooted custom of ancient worship, King Seiso in 1784 issued an order prohibiting its preaching which was followed by a severe persecution. Though later occasionally the persecution was more or less relaxed, nothing for a time indicated a revival of Christianity. In 1833 a French missionary named Pierre Maubant came to Chosen to preach the Gospel. He was the first foreign missionary to tread the soil of the hermit kingdom. His energetic and devoted evangelistic work was not fruitless, but it alarmed the government officials, who in 1839 issued a prohibition edict. But it failed to suppress the spread of Christianity, and in 1863 there were as many as 18,000 converts. In 1866 the persecution against Korean converts

Digitized by Google

was renewed with vigour, which cost the lives of 30,000 people. In 1882, however, freedom of worship was fully recognized in the country as a result of diplomatic pressure brought upon its government, and in 1885 several American missionaries came to Korea. This was the first time for Protestantism to be preached there, and it gained influence among the masses as time went on. When in 1906 Prince Ito, the foremost Japanese statesman at that time, was appointed first Resident-General, he pursued a policy of friendliness toward these foreign missionaries, this policy being pursued up to the present day under various Governors-General. The following table gives an idea on the situation of Christianity in Chosen in 1933 and after:

1937	No. of Missionaries	Number of Members
Presbyterian	140	281,939
Roman Catholic	120	109,963
Japan Episcopal Church	27	8,688
Greek Orthodox	1	230
Seventh Day Adventist	9	5,096
Methodist	67	54,654
Salvation Army	19	6,387
Others and total	406	4^9,300
1933	2,647	422,580
1934	2,653	441,419
1935	—	463,399
1936	3,195	477,100

Communications and Transportation

Highways Highways existed in Korea in olden times. The Peking highway, which was one of them, connected Peking with Gishu and Keijo, and through that way embassies were exchanged between the old Korea and China. But in later years they were left in ruin. Under the Residency-General work for new ones was started with a sum of ¥1,500,000. As the first stage plan construction of four new lines aggregating 254.80 km. in four provinces was commenced in 1907, and in 1908 on another 196 km. highway in various provinces. In 1909 construction of three more highways totalling 188.16 km. in length was started, together with widening and readjusting works of streets in Keijo, Taikyu and Jinsen. In 1910 construction of twelve roads extending 164.64 km. in length was also commenced.

Since 1910 the Governor-General devised a plan to improve highway facilities through a construction of 23 roads extending over 2,263.60 km. with a sum of ¥10,000,000. The work was to run for five years consecutively, beginning with the fiscal year 1911.

At the end of 1937, the total highways in Chosen extended 27,731 km., including 38 first class roads 3,241 km., 97 second class roads 9,966 km., and 516 third class roads 14,524 km.

Railways The construction of railways as a civilizing agency is being vigorously carried on in accordance with the 12 year programme laid in 1927. The programme covers the construction of a Tumen River line and four other lines totalling 1,384 kilometres and the purchase of five lines including the Zenshu-Riri Railway, totalling 339 kilometres. At the end of September, 1938, the total government-owned railway mileage reached 4,070.1 kilometres in active operation, 328.5 kilometres of which are run by the South Manchuria Railway Company. The following gives some idea of the development of railways run by the government up to 1936.

	Length k. m.	Passengers	Freight (tons)	Receipts (yen)
1931	3,009	19,673,704	6,025,150	36,300,512
1932	3,142	20,591,638	6,248,863	40,154,103
1933	2,935	22,238,338	7,254,859	43,611,142
1934	3,078	25,614,000	7,681,000	51,148,000
1935	3,389	29,344,188	8,667,642	56,477,897
1936	3,575	33,708,178	9,980,227	65,036,058

As for the private railway enterprises in Chosen, regulations were issued in 1912 so as to provide adequately for effective supervision and protection. In 1921 new regulations were issued by which increased state aid was extended to private railway undertakings. These have in consequence made rapid progress, and in 1936 their total mileage reached 2,108.7 kilometres operated by 8 companies, carried 8,035,041 passengers and 2,064,867 tons with the receipts of ¥7,422,229.

Tramways The main tramway lines now in operation are 5 with aggregate mileage of 81.2 km.

Bus In October, 1937, there were 179 persons engaged in bus business with

Digitized by Google

business lines extending 26,331 km.

Navigation There are now 870 steamships with the total tonnage of 64,641 tons, their routes being interport, Korea-Japan and Korea-China-Russia. The following table shows the progress in this method of transportation in recent years :

	Steamers		Sailing-boats	
	Number	Tonnage	Number	Tonnage
1925	147	44,520	627	21,075
1929	185	47,161	694	23,083
1930	196	53,998	692	22,911
1931	202	52,302	745	24,778
1932	223	57,512	756	24,889
1933	235	57,920	796	26,573
1934	259	53,547	851	28,429
1935	870	64,641	10,502	134,386
1936	1,134	70,184	11,730	150,473

Navigable Rivers The most important river in Chosen is perhaps the Yalu or Oryokko which, forming the boundary line between Chosen and Manchoukuo, rises in the Paktusan or "Ever-white" Mountains (2,744 m.) and empties into the Yellow Sea. Its length is about 800 km. of which about 700 km. is navigable by air-propeller boats under governmental subsidy. Timber felled on the mountain slopes is made into rafts and floated down until it reaches the lumber-yards at Shingishu or Antung. Another river of importance is the River Daido which flows through Heijo and empties into he Yellow Sea in the neighbourhood of Chinnampo. The river is 400 km. long, navigable for a distance of 245 km. There are also four other rivers wide enough for navigation by sailing boats and motor boats. These are Rakuto (flowing into Chosen Channel) 344 km. (Navigable course), Kanko (flowing into Yellow Sea) 300 km., Kinko 130 km., and Tumen 85 km.

Airways There are at present three airports established in Chosen. These ports are located at Urusan, Keijo and Heijo. Besides that in the following places ground marks are set up : Urusan, Kwokan, Taiden, Tenan, Shariin, Heijo, Teishu and Shingishu. Moreover, in Urusan and Keijo there are now built wireless stations for keeping in communication with the airways. At the airport of Urusan there is installed a meteorological observatory for forecasting weather conditions in the interests of air navigators. Most of the air traffic between Chosen and Japan is being done by planes belonging to the Japan Air Transport Company.

Post, Telegraph and Telephone Prior to 1905 there were 516 postal offices in the peninsula. In September, 1938 they numbered 1,164, including 147 offices engaged for telegraph and telephone service exclusively. Number of mails accepted and delivered in 1937 amounted to 341,069,859 and 358,973,292, that of parcels to 2,878,971 and 4,298,184 and that of telegrams to 10,284,478 and 10,285,675 respectively. In November, 1926, a Radio Broadcasting Office was established in Keijo and opened to business in February, 1927. Fusan Office was opened in 1935, Heijo Office in 1936 and Seishin Office in 1937. At the end of 1937 there were 111,838 subscribers.

Public Hygiene

Prior to 1906 Chosen was a land practically without access to any medical service worthy of the name and the sick were simply placed under the care of unqualified practitioners of the old Chinese school or of witches or magicians. The situation was made worse by an entire lack of sanitary equipments and pure water, the consequence being frequent outbreaks of various infectious diseases. As soon as the protectorate was brought into existence in 1906 the first step taken by the government with a view to giving the nation the benefit of sanitation was the establishment of a modern hospital in Keijo. Since 1910 further steps have been taken to extend modern medical and sanitary benefits among the masses, even among those in very remote regions. The construction and extension of waterworks is another work pushed on by the government with vigour so as to provide the people with good drinking water. The Government-General has also taken efficient and energetic measures for the prevention of epidemics ; in consequence, small-pox which was formerly so virulent in Chosen, has almost died out. Moreover, sanitary regulations relating to foodstuffs, drinks, and drugs are rigidly enforced. Medical and hospital equipments have been greatly improved. At the end of 1937 hospitals numbered 144 including government institutions, and there were 2,906 licensed medical practitioners which meant that there was only one physician for every 7,533 of population. Dentists numbered 837. The number of deaths caused by infectious diseases was 3,321 out of 17,869 patients.

Prohibition of Opium Smoking Soon after its inauguration the Government-General made a serious effort to deal with opium-smoking. The habit of

Digitized by Google

opium-smoking among the Korean people had been quite strong, specially among those in the frontier regions, many deaths resulting therefrom. The Government-General's drive for the abolition of this vicious habit was a thorough one. The following is the policy being pursued by the Government-General since 1929 in its effort to conquer the evil of opium-smoking :

1. Efforts shall be made to cure all morphine addicts within ten years.
2. All addicts shall be registered and a fixed quantity of morphine administered.
3. The Government-General shall monopolize the manufacture and sale of morphine which is supplied to the registered addicts above mentioned.
4. Stricter control of morphine shall be enforced and no morphine be used by persons other than registered addicts, and heavier punishments be provided for smugglers and secret sellers of morphine.
5. Schools and other institutions of social culture shall educate the public in order to prevent the development of addicts and to assist the already cured to avoid relapse.

On March 3, 1930, the Government-General issued an order forcing all addicts to be registered and in 1935 the Ordinance of Control of Narcotics was issued the result of which was very good and the number of registered addicts was only 315 at the end of 1935 as against 3,278 in 1930.

Principal Cities and Places of Interest

Keijo (Seoul) In 1392, A.D. at the old palace in Songdo Yi Taijo, the founder of the Yi Dynasty, ascended the throne after a stormy coup d'état against the former Wang Dynasty, and selected Seoul as his new seat of government. His palaces were surrounded with great walls. Seoul became the scene of the Hideyoshi Invasion of 1592 and the Ching Conquest of 1636. More recently the Sino-Japanese War was fought around it.

The age-old lofty peaks of "Hokkansan" (Pukhan) on the north and the green-clad slopes of "Nansan" on the south, permanent sentinels of the old capital, look down on the transformed city. The Kan (Han) River which encircles the site of the town tells mysterious tales of the past, but its course is now spanned by modern heavy steel bridges over which run steam trains, electric trolley cars and hooting motors. Under them fussy motor launches thread their way through drowsy sails of the tenaciously enduring junks. A glimpse from the sky reveals the city changing to modernity, but withal the historical palaces and gates remain to draw attention and provide a panorama combined of the old and new.

Keijo Station is the main entrance to Seoul. Every day ten thousand passengers rush in and out of this station. It is located outside of the South Gate between main streets of Keijo and the suburb of Ryuzan.

The Commercial Museum was built in 1929. Visitors can readily get here the first hand information on agricultural products and manufactured goods of the peninsula as well as on its methods of commercial transaction.

The Nandaimon (the South Gate) is the largest and most beautiful of eight gates on way to Keijo. During the reign of the Yi Dynasty, the gate served as the main entrance to the capital. Then, when the great bell installed at the heart of the city rang in the evening the gate was closed and traffic stopped. The walls have gradually been removed and broad paved roads laid in their place. Their remnants still exist on mountain slopes nearby. The old gate was built in 1396 under the reign of King Yi Taijo and there it proudly stands with its splendor today, a flower of the oriental art, challenging modern buildings that surround it.

The Chosen Jingu. To the right towards "Nansan" from the "Nandaimon" by the broad asphalted road and still higher through the stone "Torii" by the granite stairway of 384 steps, the threshold of the grand Chosen Jingu is reached. This shrine is dedicated to the spirits of the great Amaterasu Omikami, Sun Goddess, and of the late Emperor Meiji as Guardian Deities of the peninsula. The construction work started in May, 1920 and completed after five years and six months at the cost of two million yen.

The Great Bell. In the heart of the city at Shoro (Chongno), a red painted belfry in Korean style towers which contains the Great Bell, ten feet high with a circumference of twenty feet. Though silent now, it rang twice a day under the old régime before daybreak and at sunset. The early morning bell announced opening of the eight gates of the city, while the evening bell ordered their closing and instructed men to withdraw from the streets so that women could go out. This bell was cast in 1468 by order of King Seicho, and at first it was placed in a belfry at the Nandaimon.

The North Palace (the Keifukukyu)

Digitized by Google

present fertile land. More than half of the arable land in Chientao is owned by the Koreans while a portion of the rest, though under Manchou ownership, is cultivated by Korean tenants. So Chientao has appearance of being a portion of Chosen.

Other groups of Koreans crossed the Yalu River and advanced to the interior of Manchuria. After the Russo-Japanese War still greater number from the north and south of Korea swarmed into Manchuria through Antung, and many have settled in the regions now traversed by the North Manchuria and the Kirin Tunwha Railways. According to the official returns for 1937, they number about 412,490, but the actual figure may be twice as large. These Korean farmers have transformed vast dreary wilds into 100,000 chobu of rich paddy fields, which form a good economic resource to Manchoukuo. The Government-General, in conjunction with the Imperial Government and the South Manchuria Railway Co. are making efforts to promote education, public health, quarantine, banking industries, relief work, police affairs, census registration, etc. for these people. With the birth of Manchoukuo the general conditions changed and the Koreans in Manchuria began to be prosperous, so that the Koreans at home began moving afresh to the new state in increasing number.

In order to provide permanent settlements for new immigrants the Government-General established between 1931 and 1934 within safety areas of north and south Manchuria four large farm villages. At the same time various facilities to look after their health, education, economic welfare, etc. have been installed. Conditions of these farm-villages follow :

(1) The Tieh-ling farm-village is on the upper basin of the Liaoho, about three miles from Lan Hsieh-Shan Station on the South Manchuria Railway line. The total area of the village is 1,019 chobu of which 916 chobu are paddy fields. At present the village has 383 Korean families with 1,909 people.

(2) Wuchimiho farm-village is near a tributary of the Sungari River lying to the east of Harbin six miles to the north-east of Wuchimiho Station on the North Manchuria Railway line. The total area is 2,538 chobu, of which 1,660 chobu are paddy fields and 800 chobu dry land. There live in this village 683 Korean families with 2,995 people.

(3) Yingkow (Newchwang) farm-village is at the mouth of the Liao River opposite Yingkow harbour. The total area is 3,000 chobu near which a vast grassland of 15,000 chobu extends along the right bank. There are 1,857 Korean families with 9,517 people.

(4) Suika farm-village is about twelve miles to the east of Chin Chia on the Hulan-Hailun Railway in north Manchuria across the Sungari River. The total area is 1,551 chobu with 2,024 people in 450 families.

The Chientao district has long been a nest for Korean malcontents and communist bandits. They used to incessantly harass Korean farmers, especially after the Manchurian Incident. In 1932 and 1933 the Government-General set about establishment in Chientao of twenty five special farming groups. Each group organized its self-defence corps and fortified their village. These groups enlarged their safety zones, and succeeded in establishing them at various strategic points, which play an important rôle in the preservation of peace in Chientao. The Government-General provides there all means to further prosperity of the farmers and assists them in making the farms ideal ones. An agreement was also made with the Oriental Development Company in 1932 with a view to installing 2,500 families of independent farmers with a grant of ¥2,000,000 spread over five years. At the end of July, 1938, 2,800 families have been settled on an area of 13,078 cho, and the expenses needed for the purpose reached ¥1,387,013.

CHAPTER XLI

TAIWAN (FORMOSA)

General Description

Area and Topography Taiwan (Formosa) forms the westernmost part of the Japanese Empire. It is washed by the Pacific on the east, and is separated from China on the west by the Formosan Straits and on the south from the Philippines by Bashi and Balintang Channels. It extends from 119° 18′ to 122° 06′ E. longitude, and from 21° 45′ to 25° 37′ N. latitude. The Tropic of Cancer bisects the island, which is about 394.28 km. long, its greatest width being 122.31 km. The Pescadores (Bokoto) and other outlying islands form a political division of the Taiwan Government-General. They cover 126.86 sq. km. The area of Taiwan, including the Pescadores, is 35,961.21 sq. km., being about 5.3 per cent of the total area of Japan, a little smaller than Kyushu, and about one-sixth the size of Chosen (Korea). As regards its topography, Taiwan is an island which rises from the sea to a height of 3,950 metres, reached at the summit of Mount Niitaka (Mount Morrison). It consists of a mountain range with narrow valleys on both coasts which are the population centres. The valley on the west coast is the principal population centre. That on the east coast is little developed and is capable of but slight further development. The rivers are not long and their current is very swift; in the rainy season they flood the surrounding country, causing much damage. The climate is semi-tropical. In summer the north is visited by rains; in winter the south. The temperature rarely falls below the freezing point.

The Inhabitants The territorial system of Formosa was organized during five years, 1898 to 1902, by a large land-investigation enterprise made by the Government-General. The island is inhabited by Japanese, natives and foreigners. The Japanese went there after the occupation of the island by Japan, and the foreigners are mostly Chinese. The number of Western people is small. The native Chinese are mostly Mins from Fukien province and Cantonese from the China coasts across the Formosan Straits, composing 94 per cent of the total population. The aborigines consist of savages and semi-civilized tribes. The following figures show total number of the population at the end of 1935-1937:

	1935	1936	1937
Japanese	269,798	282,012	299,280
Koreans	1,604	1,694	1,985
Natives	4,990,131	5,108,914	5,261,404
Aboriginal savages	150,489	152,350	
Chinese	53,900	59,015	46,373
Foreigners	209	228	
Total	5,315,642	5,451,863	5,609,042

Including the savages, the total population at the end of 1937 in Taiwan was 5,609,042, showing an increase of 157,179 over that at the end of 1936 and 2,562,259 over the end of 1905, when the first census-taking results were announced. This means a yearly gain for the 30 years of 75,626.

The areas, population, number of counties and districts and number of towns and villages of five provinces, three districts and nine cities at the end of 1937 follow:

	Area sq. ri	Population	No. of counties or sub-districts	No. of towns and villages
Taihoku province	297.8	1,101,898	9	39
Shinchiku ,,	296.3	766,415	8	42
Taichu ,,	478.6	1,251,513	11	57
Tainan ,,	351.5	1,422,614	10	66

Digitized by Google

	Area sq. ri	Population	No. of counties or sub-districts	No. of towns and villages
Takao province	370.9	795,735	7	43
Taito district	227.9	77,842	3	11
Karenko „	300.1	124,064	3	9
Boko „	8.2	68,761	2	5
Total	2,331.5	5,609,042	53	272
Taihoku city	3.0	302,654	—	—
Keelung „	3.0	92,928	—	—
Shinchiku „	2.3	56,376	—	—
Shoka „	4.2	56,007	—	—
Taichu „	1.3	66,790	—	—
Tainan „	3.4	120,282	—	—
Kagi „	3.6	80,252	—	—
Takao „	2.6	101,173	—	—
Heito „	4.0	48,190	—	—
Total	27.8	924,652	—	—

The Climate Being in the semi-tropical zone, the summer time is long and the winter is short. The highest temperature, however, is not very much higher than in Japan proper, but the weather is warmer during the winter time. Frost is very rare and water has been known to freeze over only twice since Taiwan came under Japanese rule. The island lies in the highway of typhoons, and is yearly visited by them, terrible damage being sometimes caused.

During a 38-year period ending in 1934, Formosa was hit by severe typhoons no less than 91 times; of these, as many as 7 occurred in the year 1914.

Typhoons originate generally in the offing northeast or east of Luzon Island of the Philippines, and cross the island or enter the Chinese mainland, passing the southern or northern extremity of the island. Taiwan forms a part of an earthquake zone connecting Kyushu, Okinawa Islands and the Philippines and naturally it is very often visited by seismic shocks. The number of earthquakes registered in the island or the neighbouring seas during 28 years ending 1936, was 9,248, which means 330 a year or nearly one every day.

Administration System

When Taiwan came under Japan's rule in April, 1895, the Japanese Government established the Taiwan Affairs Bureau in June of that year and then in August of the same year the Taiwan Government-General Act was promulgated in connection with the introduction of military administration. This was replaced by the civil administration in March of the following year. The Taiwan Government-General came under the supervision of the Minister of Overseas Affairs with the establishment of the Ministry in June, 1929. The Governor-General invested with authority to require military assistance from the commanders of the army and navy in the territory under his jurisdiction, when he deems it necessary to do so for the maintenance of peace and order in Taiwan. If the Governor-General is either a soldier or a naval man, he is able simultaneously to assume the command of the Formosan Army. The Governor-General also is invested with authority to supervise officials under him, promote them in rank, retire them from service, or recommend them for honours through the Minister of Overseas Affairs and the Premier, and to suspend or cancel orders and administrative measures of provincial governors under him, when such are deemed damaging to public interest or overstepping the sphere of their authority. The Taiwan Government-General consists, besides the secretariat to the Governor-General, of five bureaux, that is, the Home Affairs Bureau, Educational Affairs Bureau, Financial Affairs Bureau, Colonial Development Bureau and Police Affairs Bureau. The chief of general affairs, or civil governor, directors of the five bureaux and many other officials are under the supervision of the Governor-General. There is an Advisory Council to the Governor-General, which serves as a very important organ for the administration of the island. Not only does it give advice to the Governor-General on laws or regulations but also on general important business. The members consist of Government-General officials and leading persons in private circles in the island. The provincial administration extends over 5 provinces, 3 districts, 9 cities and 51 counties.

Digitized by Google

There are the same number of provincial governors, district superintendents, city administrators and county chiefs, all under the Government-General.

Aboriginal Administration

The Taiwan aborigines are the oldest inhabitants of the island and are classified into semi-civilized aborigines and savage head-hunters. The former have now settled down as ordinary peaceful citizens and differ nothing in culture and general status from the natives who belong to the Han (Chinese) race. The head-hunters, on the other hand, live in mountainous districts and still adhere to their traditional habits and manners, their culture being very low. The Taiwan Government-General is concerned in its aboriginal administration mostly with these savage tribes. These savages lead a very primitive life, their dwelling-places being so difficult of access, and they still deter other tribes from settling near them by their traditional custom of head-hunting. Since Japan's occupation of Taiwan great efforts have been directed by the authorities to their subjugation and cultural improvement, and at the present time head-hunting is rapidly becoming extinct, and these savages are entering the first stage of civilized life. Some of them living along the mountain zone in west Taiwan, and those living on the sea coast in east Taiwan, pay taxes. These aborigines have a close resemblance to the Negritoes in the South Sea islands and are supposed by anthropologists to be of a Malay-origin. They may be classified into seven tribes: Taiyal, Saiset, Bunun, Tsuwo, Paiwan, Ami and Yami, and are entirely different in countenance, physical build, language and habits from the Han race who came over from continental China. These savages are distinguished by their extreme hatred of other tribes, and have a habit of combining together in an offensive and defensive alliance against any enemy. The number of these savages at the end of 1937 was 154,255, of whom 77,559 were male and 76,696 female. They lived in 25,343 houses in 429 villages. Their population in 1936 and 1937 was:

Tribes	1936	1937	Increase or decrease
Taiyal	36,128	36,660	532
Saiset	1,486	1,566	80

The Four Tribes The savages of the Taiyal and Bunun tribes are known as the most ferocious of all. Occasionally they quarrel with and even kill their own comrades. The Tsuwo tribe abolished the custom of head-hunting many years ago. The Saiset tribesmen are the gentlest of all, and are quickly losing their savage proclivities. The Japanese authorities have cudgelled their brains how to bring these wild people under control. When Holland occupied the south of Taiwan and Spain the north, they tried to pacify them principally through the medium of religion and medicine. During the time when the Cheng family from south China ruled the island, force and conciliation were adopted in turn, but the results were not satisfactory. Conciliation has dominated Japan's policy toward these savages in the island since her occupation of Taiwan. When the campaigns against rebels came to an end in 1902, attention was given to the aboriginal control policy. Owing to the stubborn resistance offered by the savages, the Governor-General, General Viscount Samata Sakuma, drafted a five-year plan for dealing with the aborigines and established the campaign headquarters in the Government-General in 1909 to start the enterprise on an elaborate scale. The fundamental policy was based on conciliation, and training the savages to become law-abiding people on the one hand, and chastisement of the insubordinate on the other. The confiscation of their arms was one of the important tasks. All arms were given up to the Japanese authorities by the northern aborigines in 1914. This completed the task of aboriginal pacification in January, 1915. Occasional raids on police stations and head-hunting of innocent people were committed after that, owing to the instigation of malcontents. The worst outbreak that took place was the Musha Incident in October, 1930, which culminated in the sending of troops. Many of them are engaged in farm work and pay taxes. Some of them receive special education. Policemen are stationed at various points of vantage in the savage districts and peace maintenance, job-finding, education, medical care, traffic, public works and sundry other affairs are being looked after by them.

The Climate Being in the semi-tropical zone, the summer time is long and the winter is short. The highest temperature, however, is not very much higher than in Japan proper, but the weather is warmer during the winter time. Frost is very rare and water has been known to freeze over only twice since Taiwan came under Japanese rule. The island lies in the highway of typhoons, and is yearly visited by them, terrible damage being sometimes caused.

During a 38-year period ending in 1934, Formosa was hit by severe typhoons no less than 91 times; of these, as many as 7 occurred in the year 1914.

Typhoons originate generally in the offing northeast or east of Luzon Island of the Philippines, and cross the island or enter the Chinese mainland, passing the southern or northern extremity of the island. Taiwan forms a part of an earthquake zone connecting Kyushu, Okinawa Islands and the Philippines and naturally it is very often visited by seismic shocks. The number of earthquakes registered in the island or the neighbouring seas during 28 years ending 1936, was 9,248, which means 330 a year or nearly one every day.

Administration System

When Taiwan came under Japan's rule in April, 1895, the Japanese Government established the Taiwan Affairs Bureau in June of that year and then in August of the same year the Taiwan Government-General Act was promulgated in connection with the introduction of military administration. This was replaced by the civil administration in March of the following year. The Taiwan Government-General came under the supervision of the Minister of Overseas Affairs with the establishment of the Ministry in June, 1929. The Governor-General invested with authority to require military assistance from the commanders of the army and navy in the territory under his jurisdiction, when he deems it necessary to do so for the maintenance of peace and order in Taiwan. If the Governor-General is either a soldier or a naval man, he is able simultaneously to assume the command of the Formosan Army. The Governor-General also is invested with authority to supervise officials under him, promote them in rank, retire them from service, or recommend them for honours through the Minister of Overseas Affairs and the Premier, and to suspend or cancel orders and administrative measures of provincial governors under him, when such are deemed damaging to public interest or overstepping the sphere of their authority. The Taiwan Government-General consists, besides the secretariat to the Governor-General, of five bureaux, that is, the Home Affairs Bureau, Educational Affairs Bureau, Financial Affairs Bureau, Colonial Development Bureau and Police Affairs Bureau. The chief of general affairs, or civil governor, directors of the five bureaux and many other officials are under the supervision of the Governor-General. There is an Advisory Council to the Governor-General, which serves as a very important organ for the administration of the island. Not only does it give advice to the Governor-General on laws or regulations but also on general important business. The members consist of Government-General officials and leading persons in private circles in the island. The provincial administration extends over 5 provinces, 3 districts, 9 cities and 51 counties.

Digitized by Google

There are the same number of provincial governors, district superintendents, city administrators and county chiefs, all under the Government-General.

Aboriginal Administration

The Taiwan aborigines are the oldest inhabitants of the island and are classified into semi-civilized aborigines and savage head-hunters. The former have now settled down as ordinary peaceful citizens and differ nothing in culture and general status from the natives who belong to the Han (Chinese) race. The head-hunters, on the other hand, live in mountainous districts and still adhere to their traditional habits and manners, their culture being very low. The Taiwan Government-General is concerned in its aboriginal administration mostly with these savage tribes. These savages lead a very primitive life, their dwelling-places being so difficult of access, and they still deter other tribes from settling near them by their traditional custom of head-hunting. Since Japan's occupation of Taiwan great efforts have been directed by the authorities to their subjugation and cultural improvement, and at the present time head-hunting is rapidly becoming extinct, and these savages are entering the first stage of civilized life. Some of them living along the mountain zone in west Taiwan, and those living on the sea coast in east Taiwan, pay taxes. These aborigines have a close resemblance to the Negritoes in the South Sea islands and are supposed by anthropologists to be of a Malay-origin. They may be classified into seven tribes: Taiyal, Saiset, Bunun, Tsuwo, Paiwan, Ami and Yami, and are entirely different in countenance, physical build, language and habits from the Han race who came over from continental China. These savages are distinguished by their extreme hatred of other tribes, and have a habit of combining together in an offensive and defensive alliance against any enemy. The number of these savages at the end of 1937 was 154,255, of whom 77,559 were male and 76,696 female. They lived in 25,343 houses in 429 villages. Their population in 1936 and 1937 was:

Tribes	1936	1937	Increase or decrease
Taiyal	36,128	36,660	532
Saiset	1,486	1,566	80
Tsuwo	2,167	2,204	37

1937	—	9,234,244

Sweet Potatoes Sweet potatoes also are extensively produced almost everywhere and all through the year in the island. The chief producing centres are Tainan, Taichu and Takao provinces. Potatoes serve as fodder for cattle besides being used as ordinary foodstuff. Dried potatoes are shipped to Japan as material for producing alcohol and starch. The export value of dried potatoes for 1935 totalled 44,332,580 kin (one kin being 1.3 pounds), worth ¥1,290,-529. The crop of sweet potatoes for 1902 amounted to 501,160,292 kin and the amount has been increasing yearly since. The 1937 crop totalled 2,949,974,884 kin. The plantation area of 47 ko for 1902 increased to 143,308 for 1937.

Tea Tea is one of the principal exports of Taiwan. The export totalled once as much as ¥11,500,000, though it has somewhat declined in recent years. The tea production amounted to 20,808,-765 kin (in plantation area of 28,308 ko) for 1902 and that for 1936 amounted to 18,081,426 kin (in the area of 46,068 ko). Tea plantation was introduced there by immigrants from China. In 1868 some amount of tea roughly made in Taiwan was exported to Amoy, where it was refined, but later the Taiwan producers, bringing tea operators from Amoy and Foochow, began to export refined tea, and in 1869 as much as 280,000 pounds of refined tea was exported to New York. This was the first export of Taiwan tea to America. Then tea production developed considerably year after year. Export tea is classified into varieties, viz., Oolong, Pouchong, green and black. Oolong and Pouchong teas are most abundantly produced; the former, appreciated by Americans, and the latter, preferred by the people of the South Sea Islands, is exported to Java and Siam. Black tea extending its markets, and, although not as good as Ceylon tea, it is better in quality than Japanese black tea.

Other Products Other agricultural products are peanuts, beans, wheat, sesame, longan, (otherwise known as "dragon's eye") and vegetables. The yielding areas and production of these farm products for 1937, as compared with those for 1900, follow:

	Yielding area (In ko)		Production (In koku)	
	1900	1937	1900	1937
Peanuts	11,958	32,441	120,838	627,700
Beans	11,365	13,609	50,281	58,887
Barley	1,479	674	11,460	4,591
Wheat	1,857	540	11,282	4,272
Sesame seeds	6,889	3,204	36,279	11,524
Jute	1,155	5,217	1,481,548 (kin)	15,371,005 (kin)
Hemp	1,654	1,949	1,022,063 ,,	2,317,421 ,,
Tobacco	240	1,511	363,900 (kg)	2,611,461 (kg)
Oranges	.317 (1905)	—	2,025,965 (kin) (1909)	—
Pneapples	—	7,969	—	110,156,884 (pieces)
Longan	—	620,161 (trees)	—	2,569,348 (kin)
Vegetables	—	—	—	¥14,621,109

The export of raw pineapples for 1936 totalled ¥162,333 and that of canned pineapples ¥7,244,262.

Bananas are Taiwan's representative fruits. They are planted everywhere in the island, but are produced most heavily in Taichu province, where 52 per cent of the total production is got. They occupy the third position in the export list of the island, the first being rice and the second sugar. Bananas exported during 1936 totalled 3,050,000 baskets, one basket being 75 kin, worth ¥14,000,-000. In 1909 the plantation acreage was 560 ko with a crop of 10,536,062 kin, which increased in 1936 to 22,527 ko with a crop of 339,508,000 kin.

central shrine of worship for the Japanese people in the island. It is located in a suburb of Taihoku, the capital of the island, and is dedicated to Okuninushi, Oanamuchi and Sukunahikona, all legendary leaders of the early Japanese race, and to His Imperial Highness General Prince Yoshihisa Kitashirakawa, who died in the island when commanding the Japanese expeditionary force in Taiwan during the Sino-Japanese War. Shintoism, Buddhism and Christianity have been propagated by the Japanese since 1895. Confucianism is observed among the natives and Chinese people in the island.

Education The continuous efforts of the Government-General have been rewarded to such an extent that the natives have been receiving education since 1922 together with Japanese in the classes of middle-school grade and in higher institutions, although the elementary education is still given both in the vernacular and Japanese languages. Besides numerous elementary schools. Taiwan had at the end of April, 1938, 4 kindergarten, 14 middle schools, 15 girls' schools, 12 business schools of middle school grade, 4 normal schools, 4 colleges and 1 Imperial University. The Taihoku Imperial University was founded in March, 1928. It consists of two departments, one literature and politics and the other physics and agriculture. The educational expenses for the last six years are :

	Total amount	State expenses	Provinces and districts	Cities, towns and villages
		(In ¥1,000)		
1933	16,723	4,895	7,842	3,985
1934	18,026	5,042	8,391	4,593
1935	21,264	5,839	9,179	6,245
1936	23,549	6,315	10,043	7,191
1937	28,565	6,945	11,862	9,757
1938	32,910	8,923	13,662	10,325
Average	23,506	6,326	10,163	7,016

Agriculture

Agriculture is the most important industry of Taiwan. Since the island came under Japan's control, it has made a rapid development and the total farm production in 1937 was worth ¥402,990,000, composing about 50 per cent of all the industrial production of the island. The area under cultivation in 1899 was 363,290 ko(one ko being 2.377 acres or 2,934 tsubo). It increased to 883,256 ko at the end of 1937, more than double that of 36 years ago. The cultivated land is more than 20 per cent of the island's total area. The area of cultivated land since 1899 has been as follows :

Year	Paddy field	Dry land	Total
	(In 1,000 ko)		
1889	211	151	363
1907	328	345	674
1912	346	364	711
1917	330	412	742
1922	376	397	773
1927	399	422	821
1929	406	423	830
1930	408	428	836
1931	411	424	835
1932	439	400	839
1933	482	362	845
1934	463	388	851
1935	493	363	856
1936	533	338	872
1937	544	338	883

People engaged in agriculture are about 53 per cent of the total population. At the end of 1937 their number was 2,880,410 of whom tenant-farmers were 877,171, landed farmers 1,062,201, and landed tenant-farmers 941,038.

Rice Crops The climate is very well suited to rice cultivation especially in the western district, where crops are harvested twice a year. The production in 1936 was about 9,550,000 koku with a value of over ¥210,000,000. Rice forms the chief of the three most important farm products of Taiwan, that is, rice, sugar cane and potatoes. Rice known as Hōrai rice is grown heavily in recent years. Its plantation area for 1936 totalled 702,685 ko and the crop amounted to 9,558,390 koku for two crops a year. The plantation areas and rice crops since 1899 follow :

Summary Summarizing the status of the sugar industry, the caneplantation area at the beginning of 1902 was 26,-167 ko, and there was only one mechanically-operated mill with a daily capacity of 200 tons and capitalization of only ¥1,000,000. In 1927 such mills numbered 45 with a daily productive capacity of 39,414 American tons and total capitalization of ¥290,520,000, although this dropped to ¥233,520,000 in 1936, owing to mergers or readjustment of business. But the capacity increased to 43,528 American tons for 1935. The total production in 1902 was only 90,000,000 kin, but in 1927 it rose as high as 1,315,540,-000 kin and further to 1,648,440,000 kin in 1932. It increased to 1,678,920,000 kin in 1937.

Companies	Head offices	Capital Sub-scribed (In ¥1,000)	Paid-up	No. of mills
Taiwan Sugar	Heito, Takao province	63,000	43,080	13

Sugar production in Taiwan since 1903 is as follows:

Digitized by Google

for the acquisition of canes became severe.

Upon Consolidated Basis In order to prevent evils arising out of this competition, the authorities issued regulations restricting the spheres of cane plantations in 1905. This caused sugar-makers to work on a consolidated basis yearly. As it was impossible for sugar manufacturers to get material from districts other than those designated for them by regulations, the makers took great care of the planters working on their fields. Planters also were placed on a definite basis of economy by the regulations, because the canes raised by them could be sold to the mills to which they belonged. When the sugar policy was established, the Extraordinary Taiwan Sugar Affairs Bureau was organized, but it was later replaced by the Sugar Refinery Section of the Colonial Development Bureau. The Government-General first established the Young Cane Seed Experimental Station in Taichu province in 1913. Seeds raised there were distributed to intermediate experimental yards, where they are further grown. Manufacturing companies are bound by duty to distribute these seeds free to farmers within their plantations. Thus the improvement of canes was realized. Young plants distributed till the end of March, 1938, totalled 657,900,000.

The Sugar Experimental Station The Taiwan Government-General Sugar Experimental Station was reorganized and was founded in Taiwan city in March, 1932, as the central organization for the promotion of sugar plantation. At first, the Hawaiian "rose bamboo" canes were adopted for the Taiwan sugar cultivation and canes of this kind occupied 96 per cent of all grown in 1913. Due to lack of adequate measures to keep the quality unchanged, and also to the fact that these canes had little power of resistance against storms they finally deteriorated. Then they were replaced by Java canes. At the end of March, 1932, the land under irrigation totalled 112,416 ko. The following are figures showing the area of sugar plantations and crop per ko since 1902:

Fiscal year	Plantation area (In ko)	Cane crop (In kin)	Crop per ko (In kin)
1905-06	35,158	1,690,206,794	48,078
1908-09	39,035	2,219,471,541	56,858
1910-11	75,329	3,159,598,569	41,944

1935-36	128,329	13,190,389,434	102,785
1936-37	124,555	14,271,874,413	114,583

Production of Sugar The sugar industry at the time of Japan's occupation of Taiwan was very primitive. Out of about 1,100 sugar mills, not a single mill had adopted the modern mechanical method of manufacturing, and all of them used animal power. Owing to insufficient pressing power, a large percentage of sugar-substance was wasted during the manufacturing process and, moreover, the product was inferior. By 1934 there were only 92 mills of this kind, as the majority of them were gradually eliminated. In these primitive mills two stone wheel cars or three metal wheel cars are employed for grinding by animal power. Improved mills use pressing machines and motors. Brown sugar is also manufactured. Such mills numbered only 6, with a total productive capacity of only 910 tons for 1934. The modernly-equipped mills have pressing capacity ranging from 300 to 3,000 tons a day and are able to produce in great quantity. The Taiwan Sugar Manufacturing Company founded in 1901 was the first of its kind. During the financial boom following the Russo-Japanese War many sugar-manufacturing concerns were established, and Japan finally leaped into a prominent position among the world's sugar-producing countries. In 1934 there were 50 mills with the daily productive capacities of 28,150 British tons and 13,400 American tons. Most of them produce crude sugar known as centrifugals. Some of them turn out white sugar by a change of milling operation. Sugar-cane pressing capacity and production of white sugar follow:

Summary Summarizing the status of the sugar industry, the caneplantation area at the beginning of 1902 was 26,-167 ko, and there was only one mechanically-operated mill with a daily capacity of 200 tons and capitalization of only ¥1,000,000. In 1927 such mills numbered 45 with a daily productive capacity of 39,414 American tons and total capitalization of ¥290,520,000, although this dropped to ¥233,520,000 in 1936, owing to mergers or readjustment of business. But the capacity increased to 43,528 American tons for 1935. The total production in 1902 was only 90,000,000 kin, but in 1927 it rose as high as 1,315,540,-000 kin and further to 1,648,440,000 kin in 1932. It increased to 1,678,920,000 kin in 1937.

Sugar production in Taiwan since 1903 is as follows:

Digitized by Google

Mineral Products

The principal mineral products of Taiwan are gold, silver, placer-gold, quicksilver, copper, iron, lead, zinc, coal, petroleum, sulphur and phosphorus. The mine-lots at the end of 1937, numbered 695 with a total area of 211,655,230 tsubo, one tsubo being six feet square. Mines in operation numbered 270 covering an area of 108,530,000 tsubo. Of these 270 mines, 2 were gold mines, 2 gold and silver mines, 1 gold-copper mine, 29 placer-gold mines, 195 coal mines, 12 sulphur mines and 19 oil fields. The mineral production for 1937 totalled ¥36,223,154 showing an increase of ¥7,496,176 over 1936. The mineral production during the past five years, 1932-1936 inclusive follows:

	1932	1933	1934	1935	1936
		(In yen)			
Gold	¥22,733	1,681,592	1,581,328	3,494,040	4,223,712

Carbon black	43,552	205,527	341,079	516,125	291,554
Others and total	13,337,790	13,950,888	14,196,250	22,838,751	28,726,978

The Government-General conducted a mineral and geological investigation for eight years over the island following the introduction of civil administration in 1896. As a result, oil distribution was found almost all over the island. Subsidies were granted to those who had proper equipment for boring for oil to a depth of more than 2,000 feet. The subsidy was given from 1901 to 1924. It was then suspended, owing to financial reasons, but was resumed in 1930. Metal ores are found exclusively in the extreme north and the eastern district, coal in the northern and central parts and oil all over the island, especially in the central and southern districts. The mineral production in 1897 was only ¥112,000, but in 1907 it increased to ¥2,255,000, and in 1936 to as much as ¥15,196,250. Of this more than 50 per cent was coal, gold-copper ores 25 per cent; gasolene 4 per cent; gold 10 per cent; other minerals in smaller amounts in the following order: petroleum, carbon black, copper, placer-gold, gold ore, and sulphur.

Gold and Silver. Placer-gold was first discovered by Japanese invaders in Taiwan over 400 years ago, when Japanese pirates infested the neighbouring coasts of China. It was then got at Takkiri Gorge in Karenko district. In later years placer-gold was found in several localities, but at present the mining is conducted along the Keelung and other rivers. When the mining was most prosperous in 1903, the annual output reached 161 kan, one kan being 8.267 lb., valued at ¥610,000, but since then the industry has been sinking. The 1931 output was only 3.165 kan. A gold vein was first discovered at Mt. Kubu in 1893. In the following year gold deposits were found at Kinkwaseki and in 1891 another vein was discovered at Butanko. The gold mining interests at Butanko and Kinkwaseki was merged in 1913. The mining operation is done at Zuiho and Kinkwaseki. The Kinkwaseki mine is located about 10 miles east of Keelung. It is managed and operated by the Tanaka Mining Company, Ltd. The mining area at the end of 1931 was 4,053,000 tsubo. It has its own refinery.

Production at the mine for four years ending 1936 follows:

		1933	1934	1935	1936

Oil Oil in Taiwan was discovered by a Chinese about 80 years ago at Shukotan, near the Koryu valley, over an area covering 599,670 tsubo. Since 1905, 71 oil wells have been sunk. Well No. 18 is the best of all. From 1913 to 1925 the oil output from this well totalled 53,205 koku, by the Nippon Sekiyu Kaisha (Japan Oil Company, Ltd.). Owing, however, to the concentration of energy on the exploitation of the Kinsui Oil Field by the company, the output has gone off from the daily output of 300 koku. Lamp oil, gasolene, light oil and paraffin are manufactured from crude oil obtained here. The oil refinery is in Byoritsu.

The production from the crude oil is gasolene, 5 per cent, lamp oil 85 per cent, heavy oil 8 per cent and wax.

The kinsui oil field is the most important one in Taiwan. It is operated by the Japan Oil Company. A government subsidy was paid to exploit wells No. 1 to No. 5. It took eleven years for well No. 5 to realize satisfactory results. Well No. 10 produced an enormous output of 30,000,000 cubic feet a day in March, 1930, and a gasolene plant was installed there in November of the same year. When the capacity of the gasolene plants is fully developed, the daily output of gasolene will be 1,000 koku.

Other Industries

Prior to the World War, industries other than sugar and tea developed very little in the island. Since the War, however, chemical, spinning, machinery and other miscellaneous industries have developed to a considerable extent. The more important of those which are not mentioned elsewhere for 1936 follow:

	(In yen)
Spinning Industry	
Hemp tissues	1,242,685
Metal Industry:	
Tin plates	1,185,554
Gold and silver works	2,186,070
Machinery Industry:	
Machinery	4,713,860
Ceramics Industry:	
Bricks	3,525,415
Tiles	1,052,017
Cement	3,181,544
Chemical Industry:	
Oil cake	1,677,774
Vegetable oils	1,877,555
Papers	1,725,845
Mixed fertilizers	4,924,209
Food Stuff Industry:	
Soy sauce	2,286,681
Flour	2,123,297
Confectioneries	5,067,744
Macaroni	3,755,968
Ice	1,398,802
Miscellaneous Industries:	
Bamboo manufactures	1,986,196
Hats	3,776,790
Total industrial production	312,000,000

Overseas Trade

The overseas trade of Taiwan, although it has experienced temporary set-backs from time to time, has made remarkable progress in recent years. The bulk of overseas trade is, however, with Japan proper, the rest being chiefly done with China, the United States, the Straits Settlements, the Dutch East Indies, the United Kingdom, Germany, British India, the Kwantung Leased Territory and Hongkong. The trade is carried on principally through the four large ports of Keelung, Tamsui, Anping and Takao. As Keelung is the most important port of trade in the north, so is Takao in the south. The trade volume for 1898 amounted to ¥30,000,000 which increased to ¥50,000,000 in 1906, and, owing to the phenomenal growth of the sugar industry and import of sugar milling machinery, the amount went up to more than ¥100,000,000 in 1910. In 1917 the amount recorded a further gain to ¥234,000,000, due to active trade in sugar, alcohol and rice and heavy transit trade with China. An all-time record of ¥680,634,926 was made in the trade volume for 1935. The amount gained ¥66,770,507 over the year before. In 1929, the trade figure amounted to ¥476,000,000, but declined to ¥336,000,000, affected by a great economic depression. Taiwan's overseas trade since 1925 is as follows:

OVERSEAS TRADE VALUE

	Exports abroad and exports to Japan proper and its colonies	Imports from abroad and Japan proper and its colonies	Total	Index
		(In yen)		
1910	59,962,255	48,923,289	108,885,544	349
1925	263,214,651	186,395,340	449,609,991	1,439
1926	251,425,070	183,412,450	434,837,520	1,392

1938	2,891	3,435	914	2,229	11,661	2,232	—	—

Of the above, tea deserves special mention. In 1937 production of unrefined tea amounted to 21,553,995 kin, worth ¥10,285,535, and that of refined tea 18,954,536 kin, worth ¥13,451,724. Refined tea included ¥2,870,562 of Oolong tea, ¥3,162,587 of Pouchong tea, ¥7,417,575 of black tea, and ¥1,000 of green tea. The tea is almost exclusively produced in Taihoku and Shinchiku provinces. Oolong tea is appreciated by Britishers and Americans. The largest amount goes to the United States and the second largest amount to Great Britain. Pouchong tea is shipped to the South sea islands. Tea exports for 1937 show that the exports of black tea greatly increased amounting to ¥5,887,617 against ¥3,985,040 for 1936. Exports of Pouchong and Oolong tea for 1937 totalled ¥4,986,107, a decrease of ¥247,954 as compared with the previous year. Details follow :

Formosa Development Company

In connection with Japan's economic expansion in the island, the Formosa Development Company was founded by virtue of Law No. 43 of 1936 upon approval at the Imperial Diet on May 26 of the same year. The company is capitalized at ¥30,000,000, a half of which is invested by the Government in the shape of Government-owned property, consisting of fields, farms, forests, pastures, land and other real estate. The other half was invested by private persons. The Government organized an establishment committee of 81. Formal sanction of the company's establishment was given by the Overseas Minister on August 27. Its virtual establishment took place on November 25 of the same year. The company's paid-up capitalization amounted to ¥18,750,000. Its head office is in Taihoku and it has a branch in Tokyo. Its president and vice-president are appointed by the Governor-General of Formosa on sanction of the Overseas Minister. The company is authorized to issue Formosa Development debentures three times its paid-up capitalization.

Because of its nature as a special business institution, the Government is vest-

Digitized by Google

ed with authority to issue necessary instructions for supervision to the company. The company is not bound by duty to pay any dividend to the Government's investments until it is able to declare an annual 6 per cent dividend rate to shareholders other than the Government. When it can declare a 7 per cent dividend, it will have to pay a 4 per cent dividend to the Government, and, when it can declare more than an 8 per cent dividend, it will have to pay the same dividend to the Government. Mr. Kyohei Kato is its president.

The company engages in the following enterprises: land management, cultivation of agricultural and forest lands, mass emigration of farmers, financing and investments in promising enterprises overseas.

The company adopted a 10-year plan for the industrial development of Formosa. The plan calls for investment of ¥1,000,000,000. First-period enterprises in the 10-year plan include raw cotton cultivation, colonial development and industrial emigration. These enterprises are expected to require for the first year about ¥4,500,000, which will be supplied by the company. The company has authority to issue debentures to raise necessary funds. Later, the company will develop plantations of cinchona and cacao trees and medicinal herbs. The company has decided to found a Formosa Raw Cotton Company with a capitalization of ¥3,000,000, making it its subsidiary. Its factory will be built at Kagi. The eventual object of the cotton company is to raise 100,000,000 kin of cotton a year on a plantation covering 100,000 chobu. This amount is expected to be raised 10 years hence. Total expenditures will be about ¥30,000,000. The first year's cotton crop is estimated at about 6,000,000 kin.

Electricity

The Taiwan Electric Power Company, Ltd., was established in April, 1919, under ordinance of the Taiwan Government-General. The Government-General appraised all of its electric assets at ¥12,000,000 and offered them to the company. The Government-General owns the company's shares to that amount, being the largest shareholder. The company started a gigantic power-generating undertaking, utilizing the water of Lake Jitsugetsutan, in August of the same year, but, owing to the subsequent financial depression, the work was suspended. In 1929 the resumption of work was decided on and the necessary amount, $22,800,000 (¥45,737,211) was raised in America in July, 1931, on Government guarantee. Work was actually resumed in October of the same year on a three-year plan. Taiwan's electric enterprises at the end of 1934, are summarized as follows:

Companies	Capitalization	Lamps fitted	Power supplied kw.	Fans fitted
Taiwan Electric Power	¥34,495,000	646,994	20,822	25,934
Taiwan Electric Light	1,500,000	81,272	2,213	2,592
Taiwan Godo Electric	2,000,000	28,664	779	340

Koshun Electric	100,000	1,408	—	—
Nansho Electric	8,500	204	—	—
Total	39,343,500	769,348	24,179	29,068

Principal Cities

Taihoku Taihoku or Taipeh is the capital city of Taiwan. It is situated on the Tamsui River, near the northern extremity of the island. Formerly it consisted of three districts, Jonai, Daitotei and Manka, but with the introduction of the municipal system in 1920, all the surrounding villages were included in the greater Taihoku, and at present the city covers an area of about 15 square miles, embracing a population of 302,654. In Jonai are found the important public buildings, such as the official residence of the Governor-General, and many governmental buildings. Most of the Japanese residents live in this district. Daitotei is the commercial centre. It is inhabited by more than 63,000 people and is renowned for its tea trade. Manka is situated close to the Tamsui River, west of Jonai. This district was formerly the most flourishing part of the city. During the Manchu Dynasty its commercial supremacy was transferred to Daitotei. This district is populated by 37,000 inhabitants. There are many places of interest in and around Taihoku, of which the more famous are :

Taiwan Shrine. This shrine is situated at a point two miles east of Taihoku. The sanctuary is built in

income tax, business profit tax, liquor-brewing tax, liquor-export tax, consumption tax, mining business tax, and fishery tax. The revenue from all these taxes was, in the 1939-40 budget, estimated at ¥46,747,712. The revenue, other than from taxes, consists of receipts from the sales of stamps, railway traffic and freight charges, medical treatment charges at governmental hospitals, charges receivable at the Central Experiment Station, receipts from the sales of trees felled in the state forests, rents of homesteads and various Government buildings and loans. Below is given a brief fiscal history of the Karafuto government :

1937	41,762,000	—	15,241,000	—	57,003,000

Expenditure

The expenditures have been increasing yearly. In 1907 they totalled only ¥1,211,968, but for the 1937-38 fiscal year the amount increased to ¥35,805,000, of which ordinary expenditures totalled ¥18,848,000 and extraordinary expenditures totalled ¥16,957,000. Items of expenditure consist of administrative, educational, forestry, employment, Karafuto development enterprises, public works and many others. Expenditures for the preceding five years are ¥19,982,340 for the 1927-28 year; ¥25,691,270 for the 1928-29 year; ¥28,587,359 for the 1929-30; ¥24,629,293 for the 1930-31 : ¥21,179,749 for the 1931-32; ¥20,863,778 for the 1932-33 year; ¥22,214,586 for the 1933-34 years; ¥24,700,146 for the 1934-35 year; ¥27,462,435 for the 1935-36 year; and ¥33,228,032 for the 1936-37 year.

Monetary Organs

The principal monetary organs in the island are the Hokkaido Colonial Bank and the Karafuto Bank. The former is represnted by its branches at Toyohara, Ohtomari, Maoka, Honto, Noda, Tomarioru, Ochiai, Shirutoru, Shisuka and Rutaka; its head office being located at Sapporo, Hokkaido. The business operation of the bank in the island at the end of 1937 showed deposits amounting to ¥44,359,381 and loans advanced to ¥28,511,609. The Karafuto Bank is the only one having its head office in the island, its deposits totalling ¥3,058,-

Digitized by Google

322 and loans advanced ¥5,295,637 on the same date. The bank came into existence in May, 1914, with a capital stock of ¥500,000 which was increased to ¥2,000,000 in March, 1919. The Karafuto Bank has its head office at Ohtomari and a branch at Maoka. The two banks are doing good work for the development of the island. Besides these banks there is a special bank which has a branch at Toyohara, and that is the Hokumon Savings Bank. This savings bank branch was opened on April 1, 1922. Its local business operation showed at the end of 1937, advances figured at ¥396,144 and deposits at ¥2,538,186.

Military Training Camps

The military training camps ordinance was promulgated in April, 1926, providing for the establishment of camps for the military drilling of youths below the conscription age. The ordinance, however, was not promulgated in oversea territories, the only exception being Karafuto, where the local authorities in view of the almost complete lack of nationalistic social work in operation and of the smallness in the number of non-Japanese elements in the population, issued an order in May of the same year, making possible the growth of the military drilling work for the youths. Below is shown the present status of the work so far carried on :

MILITARY TRAINING CAMPS

Town	No. of Camps	Attendants
Toyohara	8	—
Ohtomari	9	—
Honto	9	—
Maoka	7	—
Tomarioru	9	—
Motodomari	3	—
Shisuka	6	—
Total	51	3,080

Overseas Trade

The history of the overseas trade of Karafuto since 1905 is a history of steady expansion, though it underwent a frequent recession in the course of those 31 years. The table below illustrates the trend in a more graphic way :

Year	To Foreign Countries	To Japan proper	Total
		(In yen)	
1928	937,710	97,000,380	97,938,090
1929	2,042,652	103,034,631	105,077,283

Principal shipments to Japan proper in 1934 consisted of pulp, lumber, paper, marine fertilizer, salt-salmon, salt-codfish, dried herring, dried codfish, fish oil, edible seaweed and canned crabs. Principal shipments from Japan proper

Digitized by Google

during the same year consisted of rice, cotton goods, oils, beer, saké, oats, peas and beans, salt, sugar, soy (Japanese sauce), miso (bean paste), tobacco, fish and shellfish, vegetables, fruits, and mineral products.

Trade with Foreign Countries

The ports open to foreign trade in Karafuto are Ohtomari and Maoka. The countries with which Karafuto has trade relations are Chosen, China, Eastern Russia, the Kwantung Leased Territory, America, Germany, Spain, Belgium, the Dutch Indies and Egypt. The following table contains detailed information on the foreign trade of Karafuto in the past 6 years:

Agriculture

There was practically no agriculture in Karafuto prior to its cession to Japan in 1905. No sooner had it passed into Japan's possession than vigorous steps were taken for the reclamation work of all arable lands. In 1937 the farm production reached ¥5,811,788, farming households 10,811 and arable lands 331,317 hectares. Yet the lands under actual cultivation cover only 34,888 hectares, which shows that there is still room to accommodate more farming inhabitants. The chief agricultural products are grains, peas and beans, potatoes and green vegetables, and of the grains oats and rye are most abundantly produced. Keeping livestock goes hand in hand with agriculture in the island, for it is by pasturing that the livelihood of the agricultural settlers is made more stable. Every assistance is, therefore, being given by the Karafuto government to live-stock raising. Cattle, horses, swine and foxes are the principal animals kept, with some sheep, rabbits, chickens, ducks, etc. In 1937 the total live-stock product amounted in money value to ¥3,620,573, about one-half of the entire value of farm products.

Digitized by Google

322 and loans advanced ¥5,295,637 on the same date. The bank came into existence in May, 1914, with a capital stock of ¥500,000 which was increased to ¥2,000,000 in March, 1919. The Karafuto Bank has its head office at Ohtomari and a branch at Maoka. The two banks are doing good work for the development of the island. 1905. Moreover, during the earlier period of the new régime, devastation by fire was not infrequent. On the other hand, the increased number of population in the island had the effect of increasing the demand for timber in various ways. The first task which confronted the Karafuto government in their forest administration was therefore how to protect the forests from devastation, how best to fell and how to re-stock. As a tentative re-stocking measure large amounts of seeds of todo-matsu, Ezo-matsu, Kara-matsu and silver birch were sown on a wide burnt patch of mountain-side in the neighbourhood of Ochiai in June, 1920. As the experiment was satisfactory, seedings were carried on a tract of 15.47 hectares and 50.01 hectares in 1921 and 1922 respectively. Then in 1923, the seeding work was carried on over a total tract of 4,285,09 hectares, then it was carried in the same way in 1926 and 1927 until in the latter year seedings were carried on over a tract of 10,460.74 hectares and the supplementary sowings made on a tract of 2,569.68 hectares. The total area of seeding up to 1937 reached 50,208.21 hectares.

Planting Work With the increased need of re-foresting with saplings, the seedling work has become quite important. Since the first sapling plantation was established at Toyohara in 1912 its number began to increase, and now there are 17 sapling-plantations established throughout Karafuto producing annually about 6 million saplings. Details follow :

Location	Acreage (Hectares)	Date of Establishment
Toyohara	15.2110	5/1912
Shimizu	4.9500	5/1920
Tokobo	13.0485	5/1920

Contoro	1.2500	5/1930
Nayori	7.4250	4/1931
Kamishisuka	14.9100	4/1931
Total	137.8869	—

The total area of planting up to 1937 reached 26,379.36 hectares.

Felling Work The present Government's felling work was started in May, 1927, on the estimated basis of an annual production of 535,743 cubic metres of timber. But, in view of the difficulty felt in marketing, the annual aggregate felling was reduced to the basis of 196,-370 cubic metres. The business plan for the year 1938 is as follows:

	¥
Receipts	4,020,683
Expenses	923,016

TIMBER PRODUCTION DURING 1924-1937

Year	Felling (Koku)	Shipment (Koku)	Delivery (Koku)

Forests for University Field Work It was in April, 1914, that a forest tract of 20,000 hectares along the basins of the Ai-kawa (Ai River) and Odasamu-kawa (Odasamu River) was given to the Tokyo Imperial University for the field work of forestry students of its College of Agriculture.

Before or after that year the forests totalling 94,502 hectares for the field work of the Hokkaido, Kyushu and Kyoto Imperial Universities were es-

breeding. In 1911 the hunting ban was alleviated, the annual number to be killed being limited to 550. In 1913 it became apparent to the supervisiors that the number of landing fur-seals was decreasing, so in 1915 the ban was again imposed and was maintained until 1917. It was then withdrawn, with an annual permit to kill up to 550 head. In 1924 the hunting of old, non-breeding fur-seals was started. This increased the production in the year to 824 head and that in the following year to 942. In 1937 the total reached 2,125. In accordance with the Fur-Seal Treaty concluded by Japan with the United States and Russia in 1911, Japan is paying 10 per cent annually of the profit from this fur-sealing to the governments of these two countries. Whales are principally hunted by the ships of the Oriental Whale-Hunting Company which has a base for that purpose in Aniwa Gulf. The following shows the money value of the chief fishery products :

Timber Production

The island is so thickly and extensively covered with primeval forests that, according to an authoritative estimate, about 2,976,491 hectares, i. e., about 83 per cent of the entire area of the territory, is forest land. In this estimate is included 833,333 hectares reserved for future growth and 79,365 hectares in use for the field work of the Imperial Universities of Tokyo, Kyoto, Hokkaido and Kyushu. There are about 49 species of trees and 73 of shrubs growing on the island, but those that have any commercial value are the Ezo-matsu (Picea ajanensis, Fisch), todo-matsu (Abies sachaliensis, Mast), gui-matsu, ichii (the yew, Taxus baccata), shirakaba (the silver birch, Betula alba), doroyanagi (a willow), hannoki (the black alder) tamo, and a few others. Their distribution is regular, according to districts. In the low coastwise districts we find the yanagi, hannoki, tamo, etc.; on the higher levels grow the todo-matsu and Ezo-matsu, and as we climb the slopes forests of the graceful silver birch mix with and replace the pines (matsu), growing thicker and thicker as the mountain peaks are approached. The guimatsu (a pine species) grows principally in the lower, damper land. But the todo-matsu and Ezo-matsu are the species which predominate in nearly all parts of the island, occupying as much as 80 per cent of the total forest land. The revenue from the forestry amounted to ¥25,568,000 in 1937.

Forest Administration In ancient times the entire island of Karafuto was nothing but thick forest and the natives seem to have no rules to prevent them from felling trees whenever or wherever they chose; but they apparently felt no need to fell any large amount of standing trees. The land was almost as primeval as could be imagined when it was ceded by Russia to Japan in

Digitized by Google

1905. Moreover, during the earlier period of the new régime, devastation by fire was not infrequent. On the other hand, the increased number of population in the island had the effect of increasing the demand for timber in various ways. The first task which confronted the Karafuto government in their forest administration was therefore how to protect the forests from devastation, how best to fell and how to re-stock. As a tentative re-stocking measure large amounts of seeds of todo-matsu, Ezo-matsu, Kara-matsu and silver birch were sown on a wide burnt patch of mountain-side in the neighbourhood of Ochiai in June, 1920. As the experiment was satisfactory, seedings were carried on a tract of 15.47 hectares and 50.01 hectares in 1921 and 1922 respectively. Then in 1923, the seeding work was carried on over a total tract of 4,285,09 hectares, then it was carried in the same way in 1926 and 1927 until in the latter year seedings were carried on over a tract of 10,460.74 hectares and the supplementary sowings made on a tract of 2,569.68 hectares. The total area of seeding up to 1937 reached 50,208.21 hectares.

Planting Work With the increased need of re-foresting with saplings, the seedling work has become quite important. Since the first sapling plantation was established at Toyohara in 1912 its number began to increase, and now there are 17 sapling-plantations established throughout Karafuto producing annually about 6 million saplings. Details follow:

Location	Acreage (Hectares)	Date of Establishment
Toyohara	15.2110	5/1912
Shimizu	4.9500	5/1920
Tokobo	13.0485	5/1920

Obara	6.8878	5/1929
Kitakotami	13.8217	5/1929
Towada	0.1530	5/1920
Contoro	1.2500	5/1930
Nayori	7.4250	4/1931
Kamishisuka	14.9100	4/1931
Total	137.8869	—

The total area of planting up to 1937 reached 26,379.36 hectares.

Felling Work The present Government's felling work was started in May, 1927, on the estimated basis of an annual production of 535,743 cubic metres of timber. But, in view of the difficulty felt in marketing, the annual aggregate felling was reduced to the basis of 196,-370 cubic metres. The business plan for the year 1938 is as follows:

	¥
Receipts	4,020,683
Expenses	923,016

TIMBER PRODUCTION DURING 1924-1937

Year	Felling (Koku)	Shipment (Koku)	Delivery (Koku)

Education of the Natives There are some 2,000 natives in Karafuto including Ainus, Gilyaks, Orochones and Tunguses. The Karafuto government is undertaking to educate the children of these backward natives. At the educational institution established at Shisuka-machi, where about 30 children of the natives are taught along the line of the primary school.

Religion

The three principal religions, i. e., Shinto, Buddhism and Christianity, are competing with one another in this promising field of labour. Tere are 42 propagating centres for Shintoism representing five sects, viz., Shinto proper, Kurosumi, Tenri, Konko and Taisha. There are three governmental shrines and these are (1) Karafuto Shrine, (2) Toyohara Shrine and (3) Ani Shrine, all of which are dedicated to Imperial ancestors. August 23 is the day set for annual festival of the Karafuto Shrine, which is also the Inauguration Day of Japanese administration in Karafuto. The shrine is located at Asahiga-oka in a quiet western hilly suburb of Toyohara, and strikes the chance visitor with a sense of admiration for its grave beauty. The anniversary of the Toyohara Shrine falls on July 11. Buddhism is represented by the Shin, Nichiren, Soto, Shingon, Jodo and other sects. There are 81 temples and 120 preaching houses. Christianity is being preached by missionaries of seven denominations, i. e., Episcopal, Methodist, Presbyterian, Roman Catholic, the Salvation Army, the Holiness Church and Japan Union Church. The number of Christian churches in Karafuto is 14.

Brewing Early attempts to brew saké on the island were unsuccessful. The local demand for saké was so pressing, that it led enterprisers to improve all defects in equipment and to procure water of better quality. The result proved promising, and today the island-brewed saké is as good as any produced in Japan proper. There are at present about 47 breweries. The productive value for 1937 amounted to ¥4,536,485.

PRODUCTION AND SUPPLIES OF SAKÉ

	Production		Import from Japan Proper	
	Quantity (thousand deci-litre)	Value (¥)	Quantity (litre)	Value (¥)
1928	66,603	3,862,093	254,670	1,490,544
1929	65,181	3,043,598	221,470	1,367,567
1930	45,614	1,926,964	183,310	956,698
1931	41,316	1,839,171	190,530	953,183
1932	42,748	1,800,285	172,870	921,881
1933	58,876	2,662,936	393,400	—
1934	70,423	3,205,850	502,900	—

1936	72,906	3,731,377	—	—
1937	81,988	4,536,485	—	—

Canning Industry The canning industry in this island goes back to 1909, and in 1917 the canneries numbered 111, with a total production of ¥3,370,558. Crab-canning heads the list; but the reckless catching following that year caused a falling-off in the production, which was reduced to ¥1,458,000 in 1920. The canneries were also reduced in number to 14 and amalgamated. As a result both the number of mills and products decreased. But the industry has been for a while consolidated and is developing steadily. The number of canneries and their products during the years 1933-37 follow:

Year	No. of canneries	Qty. prod'd	Value (In yen)
1933	29	38,979	1,660,643
1934	38	54,985	2,268,286
1935	28	—	3,380,000
1936	20	—	1,170,000
1937	16	—	2,185,000

Legal System and Status

Karafuto is different from other dependencies of the country in that more laws of the home land are applied there than in any of the other dependencies. But in the sense that the legal administration is different from that of Japan proper it resembles Taiwan, Chosen, Kwantung Leased Territory and the South Sea Islands. The chief point of difference is that all the laws concerning the judicial system, such as the civil law, criminal law, the laws of civil and criminal procedures, and the law of the constitution of the courts of justice are equally enforced in Karafuto and Japan proper. At present there are 181 laws of the land applied or made applicable in Karafuto, of which 27 laws are operative only partially.

There are one local court, 2 district courts, and 9 detached offices of the two district courts in Karafuto.

Education

In 1905 Japan found the island a vast, primitive desert with practically nothing done towards bringing the inhabitants to a civilized way of life. But as the immigrants settled down there arose the necessity for schooling their children. It was in August, 1906, that the first elementary school was opened at Toyohara, and in October of the same year 2 other elementary schools were opened, one at Ohtomari and the other at Maoka. At the same time, private educationists started simpler elementary schools. In 190 all elementary schools were brought under the Karafuto government. A middle school was opened at Ohtomari in 1912, a girls' high school at Toyohara in 1916, a middle school at Toyohara in 1925 and another middle school at Maoka in 1927. Meantime, girls' high schools were opened at Ohtomari, Maoka and Tomarigishi. The following tables give the main educational statistics of Karafuto:

NUMBER OF SCHOOLS, TEACHERS AND PUPILS
(March, 1937)

	No. of Schools	Teachers	Pupils
Elementary schools	253	1,453	55,868

1927, swept away practically all dwellings in Peleliu and caused no small damage to other islets far and near.

History

The discovery of the islands dates back to the 16th century, when Spain and Portugal were vying with each other for discovery of untrodden soil in any corner of the world. As they are scattered and insignificant, not all of the groups were found at the same time. The Marianas were found first and the Carolines at about the same time, though exploration of the latter was neglected for a long time until about 1885, when the Marshalls were discovered.

Found by the Portuguese, the Marianas came into the possession of Spain. Toward the close of the 19th century, Germany took possession of the Marshalls and threatened to encroach on the Carolines, then under Spanish control. Spain protested, and arbitration by the Pope in 1886 terminated the dispute amicably, the whole of the Carolines remaining under Spanish rule. Assiduous efforts by the Spanish to exploit and govern the islands continued until 1899, when, financially straitened due to the war with the United States, they sold the Marianas and Carolines to Germany. The whole of the present South Sea Islands mandated by Japan was thus shifted to the possession of Germany. The German reign lasted until 1914, when a Japanese squadron occupied the islands, which were later juridically placed under Japanese mandate, following the conclusion of the Paris Peace Treaty and other relevant agreements.

German Administration It is generally agreed that the establishment of sovereignty over the Marianas and Carolines by Spain in 1886 and the complete domination by Germany of the Marshalls in 1885 should be made the starting point in historical study of the archipelagos. Until purchased by Germany, the Marianas and Carolines had no government worthy of mention, and nothing now remains to recall the Spanish administration except the defence works on Yap and Ponape and a few buildings standing here and there. After the transfer to Germany, a complete change was effected. In the manner of the British East India Company, Germany started the Jaluit Company shortly after acquiring the Marshalls. The Government took over the business in 1906, when the company's contract expired, and tried to put all the island industries under its monopoly. Thus Jaluit has naturally flourished as the business centre of the territory, reinforced by communications with Singapore, Hong-Kong, Australia and the United States.

In looking back upon the German programme in the South Sea Islands, we are struck above everything else with the largeness of its scale. A general government was first established in New Guinea, which sought to implant German authority in the Orient by embracing the numberless islets between New Guinea and Tsingtao. A step to this end was the laying in 1904 of a submarine cable connecting Yap with Shanghai, Guam and Menado, and in 1913 a radio telegraph station of gigantic size was erected on the same island. To make a scientific study of the South Sea Islands, the German Government dispatched a number of experts. One of their discoveries was phosphate, of which a deposit of 3,000,000 tons was found on Angaur. The German Phosphate Company, founded in Bremen in 1908, conducted mining operations until the Japanese occupation. Other deposits, though less valuable, were located at Peleliu, Togobei and Fais.

Germany exercised special efforts in diffusing culture among the natives, and to this end it dispatched no less than 100 missionaries, who opened churches in all the principal villages of the islands. The older natives still keep the German style of Roman letters to this day. Besides paying attention to educational advancement within the territory, the authorities sent men of talent to Tsingtao for further study.

Relations with Japan It is presumed that there must have been some early intercourse between Japan and the archipelagos because of their geographical position, but there is no reliable evidence for it. The Japanese training cruiser Ryujo in 1884 touched at Kusaie, an islet belonging to the Ponape group, where the chief of the natives enthusiastically welcomed the crew, declaring that his people were descendants of the Japanese race. In the same year, the Japanese Government, informed of the massacre of a Japanese on Raye Island, of the Marshalls, dispatched Mr. Taketaro Goto, who succeeded in settling the matter with the local chieftain. Early commercial relations were initiated by the South Island Company (Nanto Shokai), established at Ponape with the capital of ¥44,000, but its business was soon transferred to the Ichiya Shokai, which failed in 1895. In the year following the appearance of the Nanto Shokai,

Digitized by Google

two other trading firms, the Kaitsu Sha and Koshin Sha, came into existence; the former lasted only two years, but the latter carried on business until the Japanese occupation of the islands. The Hioki South Sea Trading Company was founded in 1893 with branches at Ponape, Truk, Saipan and Guam. Since amalgamation with the Murayama Shokai in 1906, it has been operating as the South Sea Trading Company and doing an extensive business.

Population

On June 30, 1938, the total population of the mandated territory is 121,128, comprising 50,868 natives, 70,141 Japanese and 119 foreigners. Of the natives, there are 47,041 Kanaka and 3,827 Chamorro. The Chamorro enjoy high birth rate, but the Kanaka scarcely maintain the status quo. Those within the jurisdiction of the Yap branch office show yearly decrease.

When Japan took over the archipelagos, there were only a few scores of Japanese dwellers. Gradually increasing, there are now 42,418 males and 27,723 females, most of them dwelling within the jurisdiction of the Saipan branch office and being engaged in agricultural pursuits.

When placed under Japanese control, the territory had a hundred Germans, mostly engaged in missionary work and commerce. After they left, there remained fewer than 20 foreigners, chiefly Americans and British. There were, on June 30, 1938, 119 foreigners who are nearly all engaged in missionary service, cocoanut cultivation or the copra trade.

A census is taken every five years. The village officials and policemen also keep in constant touch with every change. As for Japanese settlers and foreigners, complete investigation is made in accordance with regulations. The first general census was taken in October, 1920, when the first national census was taken in Japan proper, attended with great difficulties and at enormous expense. Subsequent censuses came in 1925, 1930 and 1935.

Tribes, Customs and Manners

Tribes Opinions differ as to the tribes residing in the mandated South Sea Islands. Some say that they immigrated from the Malay Peninsula, while others maintain that they are of the Polynesian stock. Though anthropologically named the Micronesian race, it is evident that they are a hybrid. Separate groups are clearly discernible, each with its own language and customs and manners. Roughly they are divided into the Kanaka and Chamorro. The former belong to the Micronesian race, and the latter are said to be of mixed White and Kanaka extraction, though other explanations are sometimes given.

The Chamorro are supposed to have settled first in Guam, later removing to the neighbouring isles, and the fact that they now flourish largely in the Marianas, Yap and Palau seems to endorse the supposition. Though the tribe thrived fairly well under the Spanish régime, it has gradually dwindled, due mainly to massacres, until today it numbers only 3,400. The characteristic features are yellowish brown skin and black hair. The Chamorro, unlike the Kanaka, are industrious and mild in nature. Their mode of living is advanced, and some even reside in foreign-style houses with modern improvements. Their present culture owes much to religious influences in the time of Spanish control.

Kanaka is the general term for the natives of the Pacific islands. Most of those dwelling in the mandated islands belong to this group. They have dark brown or yellowish brown skin, black hair, heavy eyebrows and a big mouth. They are not hairy, and are simple and mild in nature. Though generally of medium stature, some are fairly tall. The Kanaka are cheerful in disposition, but extremely lazy. Their cultural standards are very low, and the mode of living lingers in the primitive stage. Of the total of 50,000 natives in the islands, those belonging to the Kanaka number 46,600.

Customs and Manners Because of the warm climate, it was originally the custom of the natives to wear nothing except a piece of cloth around the waist. Contact with advanced people, however, has brought a change, and some now use foreign clothing. In Saipan and the Marshalls, the natives are clad after the fashion of Europeans, but those in Ponape, Truk, Palau and especially Yap are almost stark naked. The natives are not indifferent to personal adornment. Tattooing is an outstanding example. The more complicated the tattoo marks and the larger the space they cover, the more respected is the owner. There is also the strange ornamentation of scars deliberately cut into the flesh, which has more influence in Ponape than in the other islands. The custom of driving a hole through the ear-lobe for an earring or other dangling ornaments has been becoming less common of late years, due principally to the diffusion of education.

The staple foods of the natives are fruits, fish and meat. Nature bountifully supplies cocoanuts and tubers, which are mainly relied on, and tapioca, bananas, pineapples, mangoes, lemons and oranges, all of which are used as subsidiary food. Under such circumstances, it is but natural that little attention is given to agriculture. Fishing has made but little advance, but the supply of beef and pork is fairly sufficient. Wine and tobacco are greatly sought after, though the use of the former is almost completely prohibited. The habit of chewing areca still prevails.

The structure and appearance of dwellings vary in accordance with the cultural standard of each group of isles. In Saipan there is a street that looks like one in Europe, but in Yap one is reminded of how people lived in prehistoric ages. The dwellings in Truk and Jaluit are far inferior to those in Palau and Ponape, having not even floors. A general lack of windows leaves the interiors sombre and damp. "All-men-houses" are found everywhere in the archipelagos, which serve as a sort of rendezvous for the male villagers or as inns for travellers. On Yap there are one or two houses to every village where women live when ailing.

Social Conditions

As the natives are not yet far removed from the primitive stage, their knowledge is very limited. They adhere to the traditions handed down from their forefathers and seem incapable of assimilating with any rapidity the cultural attainments of the outside world

Digitized by Google

two other trading firms, the Kaitsu Sha and Koshin Sha, came into existence; the former lasted only two years, but the latter carried on business until the Japanese occupation of the islands. The Hioki South Sea Trading Company was founded in 1893 with branches at Ponape, Truk, Saipan and Guam. Since amalgamation with the Murayama Shokai in 1906, it has been operating as the South Sea Trading Company and doing an extensive business.

Population

On June 30, 1938, the total population of the mandated territory is 121,128, comprising 50,868 natives, 70,141 Japanese and 119 foreigners. Of the natives, there are 47,041 Kanaka and 3,827 Chamorro. The Chamorro enjoy high birth rate, but the Kanaka scarcely maintain the status quo. Those within the jurisdiction of the Yap branch office show yearly decrease.

When Japan took over the archipelagos, there were only a few scores of Japanese dwellers. Gradually increasing, there are now 42,418 males and 27,723 females, most of them dwelling within the jurisdiction of the Saipan branch office and being engaged in agricultural pursuits.

When placed under Japanese control, the territory had a hundred Germans, mostly engaged in missionary work and commerce. After they left, there remained fewer than 20 foreigners, chiefly Americans and British. There were, on June 30, 1938, 119 foreigners who are nearly all engaged in missionary service, cocoanut cultivation or the copra trade.

A census is taken every five years. The village officials and policemen also keep in constant touch with every change. As for Japanese settlers and foreigners, complete investigation is made in accordance with regulations. The first general census was taken in October, 1920, when the first national census was taken in Japan proper, attended with great difficulties and at enormous expense. Subsequent censuses came in 1925, 1930 and 1935.

soncho and son-cho, and those among the Chamorro are named kucho and joyaku. The so-soncho and kucho act under the control and instructions of the branch office to which they belong, and the son-cho and joyaku assist them. The duties entrusted to these officials are (1) thorough diffusion of knowledge of the law and regulations, (2) the making of applications and reports to the branch office, and (3) the conveyance of official instructions and their fulfilment.

Police Administration Under the Police Affairs Section of the government there is a branch section at each of the six branch offices of the government. In addition, there are a police officer's detached station at Tinian, another at Rota, assistant police inspector's detached stations at Kusaie and Angaur and policemen's offices at 23 less important villages. The distribution of these stations was determined more by special local conditions than by the density of population, for each branch office of the government has its own peculiar geographical and cultural conditions. On June 30, 1938, the number of police officials at each branch office ranged from 9 to 60.

The regulations for control of the islanders established in 1916 to guard against immigration of persons without property and criminals were amplified and revised in 1917 and 1925. Special consideration is given to firearms and gunpowder, the possession and use of which are strictly prohibited to the insular inhabitants. Beverages of more than 3 per cent alcoholic content are forbidden except for medical use and religious rites. The possession and consumption of dangerous narcotics, save for medical purposes, are prohibited. Other regulations cover game hunting, publications, social gatherings and the formation of associations, collection of donations, fisheries and the employment of geisha and waitresses.

Finance

The expenditure for insular administration had been met by the military special account until an independent account of the South Sea Government was established in March, 1922. Since then the South Sea Government Special Account has been arranged and expenditures of the Government have been met by taxes, other revenues and the sum advanced from General Account. But its own revenue has increased so much that since 1932 the Islands have been receiving no budgetary assistance from Japan proper and have thus virtually become independent financially. The receipts and expenditure for the past several years follow:

ANNUAL REVENUE AND EXPENDITURE

(In yen)

Fiscal Year	Revenue			Expenditure		
	Ordinary Revenue	Extraordinary Revenue	Total	Ordinary expenditure	Extraordinary expenditure	Total
1932	4,819,299	3,134,687	7,953,986	2,500,544	2,233,198	4,733,743

The poll tax, customs duties and clearance charges on shipments constitute the premier taxes. A poll tax not exceeding ¥10 is levied on every male native aged 16 or more and from ¥2 to ¥50 on Japanese and foreigners, although there are quite a number of exceptions. All imports from foreign countries are subject to customs duty in accordance with regulations established in May, 1922. These regulations also provide that all shipments to Japan and dutiable at the destination are subject to a clearance duty at the same rate as levied at the destination.

The details of revenues are given below:

Land and Agriculture

All transactions in real estate owned by natives are subject to approval by the government, a practice initiated by the German administration to safeguard the interests of those whose concepts of property are rudimentary. Total acreage is put at 213,000 hectares, of which about 90,000 hectares are thought fit for cocoanut plantation and general farming. The land already cultivated is calculated at 55,600 hectares for paddy field and dry land, and for cocoanut plantation, leaving more than 34,500 hectares for future development. Engaged in agriculture are 40 per cent of the entire native population, viz., 22,600 natives and 35,400 Japanese. There being little need of depending for their daily necessaries upon farming, the agricultural technique of the natives is still in a primitive stage, but the rapid increase in the number of Japanese, who are setting good examples, will sooner or later bring about some improvement. Livestock farming is also undeveloped, though the natives raise cattle, hogs, goats, hens and ducks, the cattle for transportation and farming purposes and the hogs and hens for food.

Sugar-cane cultivation dates as far back as the beginning of the 16th century, but until the arrival of the Japanese there was no sugar refinery and the inhabitants ate the cane raw. The island of Saipan being found fully qualified in both climate and soil, there was established there by the Japanese a sugar industry, which has made a healthy development. From 20 hectares in 1916 cultivation increased to 455 hectares in 1919 and to 6,140 hectares in 1933. There were two companies, with eight factories, in 1919, but in view of the inadvisability of continuing business on so small a scale, the South Sea Development Company, Ltd., capitalized at ¥20,000,000, was established, taking over the Nishimura Colonial Company, Ltd., and purchasing

Representative Companies The Nanyo Kohatsu Kabushiki Kaisha, of which Mr. Harutsugu Matsué is the president, was established in November, 1921 with a capital of ¥3,000,000 succeeding the enterprises commenced by the Nishimura Takushoku and the South Sea Industrial companies on the island of Saipan under the Japanese Mandate. With sugar manufacturing as its pivotal enterprise, it has undertaken to develop the resources of the island. After less than two decades, the company has increased its capital to ¥40,000,000 taking into its hands immigration, manufacturing of starch, pure alcohol, and various marine products, mining of rock phosphate, ship building, and numerous other industries.

During the recent years, the company has advanced its enterprise far out into the Netherlands East Indies, operating cocoanut groves, collecting pearls, growing cotton, gathering gum, raising sheep, opening marine service, etc.

The head office is situated in Saipan, with its branch office in Tokyo. It has factories in Saipan, Tenian, Rota, Palau, and Ponape, and operating grounds in Agcegan, Pagan, Kusaie, Truk, Peliliu, Tokobei, Timor, New Guinea, Celebes, and even in the Philippines.

Today, the company is one of the most outstanding enterprenuer in the South Seas employing nearly 40,000 people and owes its remarkable expansion to Mr. Matsué who has been its president ever since its foundation and has shown himself to be an unusual leader.

The South Sea Development Company was founded, as a result of necessary appropriations approved by the Imperial Diet in May, 1936, following the Imperial ordinance No. 228 proclaiming its establishment was issued. An establishment committee of 28 were organized and on November 27 the company was formally founded. It is capitalized at ¥20,000,000 of which the Government invested ¥10,546,000 in the shape of its property mostly connected with the mining right of phosphate rocks in Angaur and Fuais Islands in the mandated South Seas and appended property. The remaining amount was invested by those interested in enterprises in these islands.

Its head office is in Corrol Island in Palau group and a branch in Tokyo. The company's president is appointed by the Cabinet on recommendation of the Overseas Minister. It is vested with right to issue South Sea debentures equal to thrice its paid-up capital. The Government has power to supervise the company by virtue of the Imperial ordinance. The company's business scope includes agricultural, aquatic, mining and shipping enterprises, phosphate rock mining and others, all connected with economic development of South Sea Islands. Baron Ryutaro Fukao is its president. The principal shareholders of the company are the South Sea Government, the Nanyo Kohatsu Company, the Mitsui Bussan, the Mitsubishi Goshi, the N.Y.K. and the Toyo Takushoku. The company has business relations with the Taiyo Pearl Company, the Nantaku Pineapple Com-

pany, the Nanyo Aluminium Mining Company and 6 other companies.

Transportation and Communications

There are no roads worthy of the name on the islands, though the Government realizes that they are the first requisite for industrial development. As large appropriations will be needed, their construction will have to wait for some years to come. Nor are there railways for public use. The short one at Angaur extending for 12 miles to the phosphate mine, and that at Saipan and Tinian which extends for 93 miles are exclusively for the hauling of freight belonging to the South Sea Development Company.

Land transportation is now principally carried through the help of motor cars and other vehicles imported from Japan. The character of the roads, length of each and the number of vehicles are shown in the following tables:

Extension of Roads, Dec. 31, 1937

Branch office	Width of Road (in km.) Less than 4 m	Less than 7 m	Over 7 m	Total
Saipan	39	104	28	171
Yap	—	118	—	118

Total	205	62	13,028	220	3,264	—	16,779

Improvement of transportation facilities is now being concentrated on harbours. Generally speaking, the ports are favourable for mooring of steamers with a displacement of 3,000 tons, but the long distance between vessels lying at anchor and the landing places, as well as coral rocks extending far into the sea, handicaps their healthful growth as modern commercial ports. The construction of modern harbours depends upon magnanimous appropriations and years of labour. The first real harbour, started in 1926 and completed in 1932 at a cost of more than ¥1,073,000, was at Saipan. In 1933-1935 an enlargement of the wharf was completed with an expenditure of ¥579,000. The third improvement plan which is to be completed within 6 years beginning with 1938 is now carried on. The estimated expenses will reach ¥1,870,000. A second project was launched in 1927 at Corrol, where, between the vessels at anchor and the landing place, lies a coral-reef. The work came to the completion after the expenditure of ¥106,992 in 1930, as the result of which the route has been reduced to one-third of what it used to be. A new wharf was constructed then with an expenditure of ¥84,000, and in 1934-35 another improvement work was completed. For the construction of the port of Palau ¥2,710,000 was appropriated for a 6 year plan beginning with 1936.

Shipping Routes Upon the creation of the South Sea Government, all government-controlled shipping routes were placed under the Nippon Yusen Kaisha, Ltd. The schedule for these lines in 1938 follows:

(1) West Round Line: Plying between Japan and the Philippines, the ships touch at Yokohama, Osaka, Kobé, Moji, the insular ports, Menado and Davao, covering both ways in 44 days. 36 voyages are made in a year.

(2) East Round Line: Plying between Kobé and Jaluit, the ships of the line call at Saipan, Truk, Ponape Kusaie and Jaluit, covering both ways in 54 days. 15 voyages are made yearly.

(3) East and West Connecting Line: Between Kobé, Palau, Truk, Ponape, Kusaie and Jaluit, this line includes calls at various insular ports. Both ways are covered in 53 days, and 6 voyages are made in a year.

(4) Saipan Line: The ports of call are Yokohama, Osaka, Kobé, Moji, Futami, Hachijo Islands, Saipan and Tinian. 7 round-trips, each made in 30 days, are scheduled for the year.

The number of vessels on these lines is 19, ranging from 3,141 to 6,181 tons.

are the same as in Japan proper. The natives' elementary education takes three years, and after that they are free to enter continuation courses of two years. The lessons are about the same as those taught in the Japanese schools, save for the stress placed on ethics, calculation and the Japanese language. To teach carpentry, a special institute is attached to the Corrol Public School for natives.

Christian schools number 3 in Saipan, 2 in Palau, 6 in Truk, 2 in Ponape and 1 in Jaluit. All of them are attached to churches and naturally concentrate on diffusing knowledge of Christianity. They are not worthy of being called educational institutions in the strict sense.

With the object of popularizing education, a scholarship society was formed on the foundation of an Imperial donation of ¥2,000, in February, 1924. The society is headed by the Governor, who, with the interest accruing to the original and yearly scholarship grants by the government, does everything possible to encourage deserving students. There is also the South Sea Islands Educational Society, headed by the Governor and with branches at the seats of branch offices of the government. Its sole object is elevation of the educational standard of the islanders. On April 30, 1938 it had funds amounting to ¥26,438.

The elementary schools for the Japanese, according to statistics taken at the end of April, 1938, have 155 instructors and 7,688 pupils including the continuation course. The schools for natives have 65 Japanese teachers and 26 native assistant teachers, 1,513 boys and 1,110 girls attending elementary school course, and 470 boys and 258 girls in the continuation course.

There are some private institutions, mostly kindergartens, for Japanese children. Kindergartens are found in Saipan, Yap, Palau, and Ponape, having in all 21 teachers and 342 children.

As there were not very many Japanese children, no middle school was in existence in the archipelago prior to 1933. But owing to the industrial development and the increase of Japanese residents, it became necessary to establish one, and in accordance with the prefectural ordinance of March, 1933, an industrial school was established in the island of Saipan.

Religion

Among the native inhabitants there is no religion worthy of the name, but they have a sort of religious belief. Christianity was first introduced and propagated by Spaniards in 1666. A Jesuit missionary worked enthusiastically in Guam until banished in 1766 by Charles III and is said to have initiated the islanders into the methods of cultivating corn, tobacco, cocoa and potatoes. In more recent times, an American missionary group gained influence, though it finally abandoned work in Ponape and Truk, as did a Protestant mission group from Germany in the former island. Catholicism went on evangelizing side by side with Protestantism and is said to have had more funds. Priests of the Otani branch of the Shinshu Sect of Buddhism established themselves in Saipan for religious propaganda in 1919, and in 1926 a Tenrikyo church was opened in Palau.

Soon after the evacuation of the German Protestant missionaries, the Japanese Congregational Church despatched four missionaries to Ponape and Truk. American missionaries in Kusaie and Jaluit are engaged in educational as well as religious work, and Catholic missionaries, who came in 1921 from Spain, are also active. It is generally accepted that the natives' mild temperament is the result of the long and untiring efforts of the missionaries. Generally speaking, Christianity seems to have placed the entire population under its influence, but very few of the churchgoers understand its tenets.

Since 1938, the ships of the South Sea Marine Transportation Company are ordered to make 6 visits a year at Palau on their voyages between Japan and Java.

Among the islands themselves, shipping has been entrusted to the South Sea Trading Company, Ltd., which is subsidized by the Government. The services now available are: the Mariana line, connecting scattered islets within the Mariana Archipelago, available 19 times a year; the Yap, Palau, Truk and Ponape lines, each with 5 and 4 trips a year, and the Marshall line, which make 16 trips a year. In addition there are Ponape, Truk and Palau lines. Five vessels are used, ranging from 195 to 340 tons.

Since 1938, a ship of the South Sea Development Company is ordered to run between Palau, Yap, Truk and their lone islets.

During 1933, vessels that entered and cleared the nine ports of the territory numbered 507 and 520 respectively—381 steamships, 126 sailing vessels clearing and 381 steamships, 131 sailing vessels entering. The number of passengers landing and embarking were 65,083 and 29,697 respectively.

Airway In April, 1939, an air route was opened by the Japan Airways Company. The seaplanes of the company ply twice a month, running from Yokohama to Saipan, 2,610 kilometres and from Saipan to Palau, 1,570 kilometres.

Communications All means of communication were placed under the control of the local government when it was established. The Communication Section thus takes care of (1) post, telegraph, telephone, exchange and deposit services, (2) postal insurances, and (3) sea-routes, vessels and nautical markings. There are nine post offices, situated at Saipan, Jaluit, Tinian, Rota, Palau, Yap, Ponape, and Anguar. Each handles wireless messages. The cable and wireless lines now operated are as follow:

(1) Between Yap and Bonin Islands: dispatched by the Chichi-jima Wireless, relayed at Saipan.

(2) Between Yap and all except the Bonin Islands: despatched on the submarine cable through Naha, Ryukyu (Loochoo).

(3) Between the South Sea Islands, except Yap, and Loochoo and Taiwan: sent by submarine cable.

(4) Between the South Sea Islands, except Yap, and the Bonin Islands: sent by the Chichi-jima Wireless, relayed at Saipan.

(5) Between the South Sea Islands and all outside points except the Bonin Islands, Taiwan and Loochoo: despatched by the Tokyo Wireless, relayed at Palao.

Telephone facilities are still limited, switch-boards being installed at only Palau and Saipan.

Judicial System

The judicial branch of the South Sea Government employs the double trial system, the court for the first trial being one of the Local Courts of Justice and for the second trial the High Court of Justice. To each court is attached a public procurator's office. In remote places, minor irregularities, both civil and criminal, are disposed of by the judgment of the branch office heads.

The South Sea Government's High Court of Justice is located in Palau. The Palau Local Court of Justice has jurisdiction in the Palau and Yap groups; the Saipan Local Court of Justice, in the Saipan group, and the Ponape Local Court of Justice, in the Ponape, Truk and Jaluit groups. In 1935 there were three judges, two procurators and four secretaries in the judicial system.

Most of the legal regulations are the same as those in Japan, but due consideration is given to the customs and conditions peculiar to the natives. Their civil affairs are handled quite independently of those settlers from outside; hereditary practices in land ownership are preserved, none but government officials being permitted to sell, purchase or mortgage their land; legal proceedings are made as simple as possible, and natives sentenced to less than one year of penal servitude may be subjected to labour instead of being sent to a prison.

Education

Besides elementary schools for the Japanese, there are 26 for natives throughout the insular territory. Though education is not compulsory, schools are provided, clothing and food supplied in particular cases and pupils from remote places received into dormitories. At the schools for native children, natives are employed as assistant instructors. The Japanese instructors must have the full qualifications of elementary school teachers in Japan proper.

There are schools for Japanese children in Saipan, Palau, Truk, Tinian, Yap and Ponape, and where there is no near-by Japanese school a Japanese class is attached to the native elementary school. The course of instruction, requiring six years, and the textbooks

Digitized by Google

are the same as in Japan proper. The natives' elementary education takes three years, and after that they are free to enter continuation courses of two years. The lessons are about the same as those taught in the Japanese schools, save for the stress placed on ethics, calculation and the Japanese language. To teach carpentry, a special institute is attached to the Corrol Public School for natives.

MANCHOUKUO

Geography

Position Extending between 38°43′ and 53°30′ North latitude and 117°50′ and 135°20′ East longitude Manchoukuo is bordered on the north by Siberia and on the east by Korea and the Maritime Province of Siberia.

On the west its borders touch Outer Mongolia, Eastern Inner Mongolia and China proper, while on the south its shores are washed by the waters of the Yellow Sea and the Gulf of Pechili, the coast line extending over 855 nautical miles.

Topography Topographically, Manchoukuo is a vast expanse of plains, traversed from north to south by the Great and Little Hsingan (Khinyan or Khingan) mountain ranges in the north-western section, and by the Changpai mountains near the south-eastern boundary.

Several great rivers with many tributaries run through Manchoukuo, irrigating the plains which they pass. The most notable of these rivers are the Heilungkiang (Amur), Sungari, Ussuri, Yalu, Tumen and Liao rivers.

Climate The climate of Manchoukuo is typically continental, despite the fact that this country lies within about the same latitudes as Japan, Korea, France and England.

Almost unaffected by ocean currents, Manchoukuo has a dry, cold climate with long severe winters and short hot summers. The spring season is windy, strong winds often carrying yellow dusts from the west.

The temperature falls as low as 49° C. below zero in winter and goes up as high as 40.0° C in some localities in summer.

Area, Population, Language, etc.

Area and Population The area of Manchoukuo is put at 1,303,143 sq. km. and is about twice as large as the combined areas of Japan proper, Korea, Formosa and Karafuto. Prior to 1932 little effort was made to obtain reliable census. In that year the population of Manchoukuo was estimated at 30,000,000 people. Rapid increase immediately followed with the great influx chiefly of Chinese, Chosenese and Japanese. The total population reached 33,933,206 at the end of 1937. Details follow:

CHINESE COOLIE IMMIGRATION INTO MANCHURIA (1936-38)

Year	Arrivals			Departures			Increase or Decrease
	Coolie Laborers	Family Members	Total	Coolie Laborers	Family Members	Total	
1936	358,122	65,323	423,445	366,761	69,745	436,506	(-) 13,061
1937	319,286	42,871	362,157	259,098	37,696	296,794	65,363
1938	492,376	81,410	573,786	252,798	29,891	282,689	291,097

Language Chinese is the official language of Manchoukuo, although native Manchus and Mongols living in the interior districts speak their own dialects and Japanese is now being taught at many native schools in Hsinking and other important centres of the country.

The original Manchus now living in the country are estimated to number between six and seven millions, but most of them speak Chinese, only those who live in some districts of Kirin province keeping to their own native dialect.

As the official, social and commercial language, the Peking mandarin language is most widely used in Manchoukuo, but the Shantung, Nanking, Shanghai, Canton and other dialects are spoken among the immigrants from these different parts of China.

Among other foreign languages Japanese and Russian are the best known in the country.

Banditry Manchoukuo has long been noted for its mounted bandits who ravaged the country. Under the old militarist régime even regular soldiers turned to banditry and quite often were enlisted among the regular troops when needed, so that the troops and bandits were not clearly distinguishable from each other.

Bandits in Manchuria once numbered as many as 200,000 after the Manchurian Incident owing to the fact that the regular troops in the army of Chang Hsueh-liang resorted to banditry. But the strenuous efforts of the Japanese and Manchoukuo troops have reduced the number to about 20,000 by the end of 1935.

As a result of the pacification of Jehol early in March, 1933, the base of operation of the major bandit groups was completely wiped out. With a view to furthering the work of restoring peace and order, a central peace preservation committee was organized in Hsinking. Between the autumn of 1933 and the early spring of 1934, an intensive campaign was directed against the remnant outlaws in Kirin province. Efforts are being made to confiscate the weapons illegally possessed by the people, to reduce the number of the so-called vigilance corps of the professional type, and to give work to the roaming outlaws who surrender to the authorities.

History

Before Ching Dynasty Nearly twenty different dynasties have ruled successively in the territory now under the sovereignty of Manchoukuo, which includes Manchuria and part of Mon-

Digitized by Google

golia, from the Sushen dynasty to about the second and third centuries down to the Ching dynasty, which lasted from 1636 until 1911, when its rule was replaced by the new régime of the Republic of China.

The Ching dynasty was known as the Nuchen tribe before it gained hegemony in China proper. In 1636, the chief of the Nuchen tribe declared independence at Mukden against the Ming dynasty which was then in power in China proper, naming his country, which extended over the area now forming the territory of Manchoukuo, "Taching."

After rising to full stature of independence, Taching gradually expanded its territory until 1664, when conquering the Ming forces it occupied Peking and made that city its capital, after which Manchuria seemed deserted, except for the Han immigrants who came from China proper and settled there, though only sparsely.

Thus Manchuria was left neglected by the Manchus, who were almost entirely occupied in colonizing China proper, and when Russians penetrated into Manchuria they could do just as they liked in this region.

It was not until after the Russo-Japanese War that the Chinese authorities came to see the need of attending to the administration of Manchuria with any degree of seriousness. With this object in view, Hsu Shin-chang was appointed Viceroy of the Three Eastern Provinces in 1907, and notable improvements were effected in the systems of administration, communications and transport during the following few years.

The late Marshal Chang Tso-lin came into power in Manchuria after the Revolution of 1911, when Chao Erh-hsuan, then Viceroy of the Three Eastern Provinces, asked him to render military assistance to resist the advance of the revolutionary forces on Manchuria.

Rise of Chang Tso-lin The rapid ascendancy of Chang Tso-lin then followed and in 1916 he was appointed Inspector-General of the Three Eastern Provinces, thus virtually placing the entire territory of Manchuria under his autocratic rule.

After a series of three civil wars with the Chihli army, in the course of which General Kuo Sun-lin, one of his lieutenants, made an unsuccessful attempt to overthrow him, Chang Tso-lin started hostilities with the Kuomin army of Feng Yu-hsiang, the so-called "Christian General", in January, 1926, and occupying Peking in December that year, installed himself as Generalissimo at Peking in June, 1927, thus attempting to reign over the entire territory of China.

This marked the peak of the ascendancy of the Mukden war-lord, for, in June, 1928, he had to leave Peking for Mukden ostensibly with the intention of spending the rest of his life in retirement. It was on this trip back to Mukden that the Marshal was killed in a train wreck near Mukden.

Under Chang Hsueh-liang Chang Hsueh-liang, known as the young warlord of Mukden, then stepped into his father's shoes, but finding himself unable to keep effective control over the lieutenants of his late father, he declared allegiance to the National Government in December, 1928, and was appointed commander-in-chief of the North-Eastern Frontier Army. This was followed by the renaming of Fentien province as Liaoning in March, 1929. During the civil war of 1930, Chang Hsueh-liang maintained an attitude of sympathetic neutrality, thereby making it possible for the National Army to defeat the rebels under Yen Hsi-shan and Feng Yu-hsiang. Apparently in appreciation of this, the National Government appointed Chang Hsueh-liang Vice-Commander-in-Chief of the National Army, Navy and Air Forces.

In 1931, Chang Hsueh-liang moved his headquarters to Peking and during his absence, all his influence in Manchuria was overthrown following the outbreak of the Manchurian Incident on September 18, 1931.

Founding of Manchoukuo The effort directed at restoring peace and order as the Chang Hsueh-liang government was driven out of Mukden by the outbreak of the Manchurian Incident first materialized in the Committee for Preservation of Local Peace and Order organized at Mukden. This soon led to the organization of the independent government of Fengtien province, the example of which was followed by Kirin and Heilungkiang provinces. Later, an Administrative Committee composed of members coming from various provinces was organized and preparations for establishment of the new state were made.

On February 18, 1932 the Committee fulfilled its first duty by announcing the declaration of the establishment of an independent state and appointing a standing committee of seven members for discussing various detailed problems. The fundamental principles of the new state as announced by the committee on February 25 are as follows:

Digitized by Google

the new state to be called Manchoukuo; the ruler to be called Chief Executive; the flag to be a five-coloured one; the new era to be called Tatung; and the capital to be Changchun, which later came to be called Hsinking.

Mr. Pu Yi, who was formally elected Chief Executive by the Administrative Committee, took office on March 9 of the same year. The law regulating the organization of the government and the law guaranteeing personal rights were promulgated on the same day. On the following day, Cheng Hsiao-hsu, Prime Minister, and other high officials were appointed.

At the request of the people of Manchoukuo, who appreciated and enjoyed the benevolent administration of the new régime under His Excellency Pu Yi, many of their leaders in Mukden and other principal cities and towns petitioned for his enthronement as Emperor of Manchoukuo in the beginning of 1934. This was accepted, and the Chief Executive was formally enthroned on March 1, 1934, the second anniversary of the founding of Manchoukuo. The state was thereafter called Manchoutikuo, which means the the Empire of Manchuria, the Chief Executive the Emperor Kangtê, and the new era Kangtê.

Government

Under the Organic Law of the Manchou Empire of 1934 (For the text see Fourth Report, Appendix No. 18), the State is completely centralized in the Throne. The Emperor represents the State; supervises the sovereign rights and exercises them in accordance with the Organic Law; issues or causes to be issued ordinances for the maintenance of public peace and order and for the execution of laws; possesses the power to declare war, to make peace, and to conclude treaties; enjoys the supreme command of the army, navy, and air forces; and has the power to grant amnesty, special pardon, commutation of punishment, and restoration of civil rights. The Privy Council advises the Emperor on His various functions, while the legislative, judicial, and administrative authorities execute their respective functions under His general supervision. The people are guaranteed the freedom and rights of their life and property, which guarantees were completely lacking before the establishment of Manchoukuo. The basic philosophy of the Empire is the "Wangtao" or the "Way of Benevolent Ruler."

To perpetuate the Imperial Throne thus instituted and to strengthen the foundation of the Empire, the "Law Governing Succession to the Imperial Throne of the Empire of Manchou" was promulgated on March 1, 1937, on the occasion of the fifth anniversary of the founding of the State. It (For the text, see Appendix III, No. 3) established the fundamental principle that the first ancestor of the Imperial lineage of Manchoukuo shall be H. I. M. the Emperor Kangte, and that the Imperial Throne shall be succeeded to by His Majesty's Imperial descendants for ages eternal. It then clarified the order of succession, first by the "Imperial eldest son," then by the "Imperial eldest grandson," and lastly by the "Imperial son next in age and by his descendants." In the absence of any of these descendants the succession shall revert first to the "Imperial brother and his descendants," then to the "Imperial uncle and his descendants," and lastly to the "nearest member among the rest of the Imperial Family and his descendants." The Law decreed one notable exception, namely, that "when the Imperial heir is suffering from an incurable disease of mind or body, or when any other weighty cause exists, the order of succession may be changed in accordance with the foregoing provisions with the advice of the Privy Council."

Orchid has been designated as the Imperial flower and the Imperial crest has been designed from this honoured flower.

A complete reorganization of the national administrative machinery was effected as of July 1, 1937. The main features of this reorganization were the reversion to the system of three independent branches of administration, namely, the State Council, the Legislative Council, and the Courts of Justice, and the reshuffling of the number of Departments to six, namely, Public Peace, People's Welfare, Industry, Finance and Commerce, Communications, and Justice. The salient points in the reorganization may be summarized as follows:

(1) Abolition of the practice of submitting views to the throne by the Privy Council.

(2) Abolition of the Supervisory Council and creation of a Bureau of Audit in the State Council.

(3) Establishment of an Office of Home Affairs in the State Council to take charge, under the direct supervision of the Prime Minister, of matters concerning the general guidance of local organization and the general su-

Digitized by Google

pervision of provincial governors.

(4) Inauguration of a Planning Council, under the direct control of the Prime Minister, to study and to deliberate upon basic national policies.

(5) Abolition of the Department of Foreign Affairs and creation of a new Office of Foreign Affairs, under the direct supervision of the Prime Minister, to take charge of matters concerning the supervision of envoys and consuls abroad, international negotiations, guidance and protection of nationals abroad, and investigations of international political affairs, transferring matters concerning commercial affairs to the new Department of Finance and Commerce.

(6) Creation of the Department of Public Peace through amalgamation and reorganization of the Department of Defence and the Bureau of Police Affairs in the Department of Civil Affairs, to take charge of the police affairs of the State in addition to matters concerning national defence.

(7) Abolition of the Department of Mongolian Affairs and creation of an Office of Hsingan Affairs, under the direct control of the Prime Minister, to coordinate matters concerning the administration of the Mongols.

(8) Reorganization of the existing Departments of Civil Affairs, Industry, Finance, Communications, and Education into four Departments of People's Welfare, Industry, Finance and Commerce, and Communications: (a) the Department of People's Welfare to take charge chiefly of administration concerning education, social affairs, public health, stabilization of people's life, and elevation of national spirit; (b) the Department of Industry to take charge of administration concerning industrial activities in general and exploitation and conservation of national resources, incorporating within it the Bureau of Live-Stock Farming into which is merged the Horse Administration Bureau of the former Department of Defence, the Bureau of Forestry, the Patent Bureau, and the Hydro-Electric Power Construction Bureau, and abolishing the Provisional Industrial Research Bureau; (c) the Department of Finance and Commerce to take charge of administration concerning the financing of exploitation and conservation of natural resources and other matters connected therewith, incorporating within it the General Monopoly Office and the Weights and Measures Examination Office, formerly the Weights and Measures Bureau; (d) the Department of Communications to take charge of administration concerning communication and transportation, incorporating within it the General Postal Administration Bureau and the Bureau of Navigation.

(9) Continuation without modification of the Department of Justice and its courts.

This reorganization of the Government was followed by an almost complete change in the personnel of high officials. General Chang Ching-hui was reappointed to occupy the responsible position of the Prime Minister. Other Ministers appointed are Public Peace, General Yu Chih-shan, former Minister of Defence; People's Welfare, Sun Chih-chang, former Minister of Civil Affairs; Industry, Lu Jung-huan, former Minister of Industry; Finance and Commerce, Han Yun-chieh, former Minister of Finance; Communications, Li Shao-keng, unchanged; and Justice, Chang Huan-hsiang. Hsi Chia was reappointed the Minister of Imperial Household and Tsang Shih-yi as the President of the Privy Council, while Tsai Yun-sheng was appointed the Chief of the Foreign Affairs Office.

The new Government organization of Manchoukuo is as follows:

H. I. M. The Emperor
- Imperial Household Dept.
- Committee on Imperial House Law
- Office of the Privy Seal
- Office of Aides-de-Camp
- Legislative Council
- Privy Council
- State Council
- Bureau of Audit
- Council on Decorations
- Board of Decorations
- Office of Foreign Affairs
  - Secretariat
  - Bureau of Political Affairs
  - Bureau of Investigation
- General Affairs Board
  - Council on Planning
  - Secretariat
  - Bureau of Planning
  - Bureau of Accounts
  - Bureaus of Legislation
  - Bureau of Personnel
  - Bureau of Statistics
  - Bureau of Information
  - Cadastre Adjustment Bureau
  - Bureau of Supplies and Repairs
- Office of Home Affairs
  - Secretariat
  - Bureau of Management
  - Bureau of Supervision
- Office of Hsingan Affairs
- Dept. of Public Peace
  - Secretariat
  - Bureau of General Staff

- Secretariat
- Bureau of Railways
- Bureau of Roads
- Bureau of Navigation

Dept. of Justice
- Secretariat
- Bureau of Civil Affairs
- Bureau of Criminal Affairs
- Bureau of Penal Administration

Courts
Procurator's Offices
Offices of Special Municipalities
Provincial Government Offices
Hsingan Provincial Government Offices
Metropolitan Police Board
Capital Construction Bureau

An efficient administration of Manchoukuo required an efficient organization of local administration. For such a purpose, the administrative divisions which existed in Manchuria under the former militarist régime were too vast and unscientific, and the need for reorganization was keenly felt from the early days of Manchoukuo's statehood. Moreover, the former provincial divisions carried with them the vivid memories of past misrule and a complete renovation of administrative divisions became a matter of pre-requisite in realizing a new and enlightened administration. Geographic factors and the trend of new development too had caused the emergence of new centres and had changed the general map of Manchoukuo decidedly since 1932.

With such a background and in line with the same spirit of general political reform, the first step toward the reorganization of local administrative system was effected on December 1, 1934, when the former "Four North-Eastern Provinces" were replaced by fourteen Sheng or Provinces (See Fifth Report, Sections 1-2). Under the new system, the Sheng became a mere administrative organ of the Central Government, while the division of administrative functions between central and local authorities were clearly demarcated. Thus, the Governor of a Sheng remains under the charge and supervision of the Prime Minister and Departmental Ministers. He is empowered to enforce all laws and to fulfill all instructions within his Sheng and superintends all affairs of administrative character. On the other hand, unlike the practices in force under the former regime, the collection of taxes, the stationing of troops, and the compilation of budgets are done under the direction of the Central Government. The realization of this nofeworthy change, not only helped to unify local administration, but also eliminated opportunities for fraudulent practices and divisional dissentions which characterized the local administration before 1932. A Sheng is further subdivided into Hsien or Prefectures and a Hsien into Chu and Tsun as the last local administrative units. In addition, the Hsinking and Harbin Special Municipalities and the North Manchuria Special District (it was abolished as of January 1, 1936) were placed under the direct jurisdiction of the Department of Civil Affairs. Moreover, in the districts where the Mongols predominate, the Mongolian tradition was followed and preserved to a large extent. Thus the administrative unit of the Hsingan Provinces is Chi or Banner, a legal body under the supervision of the State with an autonomous assembly to determine the budget and other important matters.

The second step toward the reform of local administration was taken on July 1, 1937, in conjunction with the general administrative reorganization above described. It added two new Sheng, namely, Tunghua and Mutankiang; it expanded the function of the Sheng government with the exception of four Hsingan Provinces, among other things, adding a share in the national industrial administration such as mining, forestry, and agricultural activ-

Digitized by Google

ities, but made the constitution of the Sheng government quite elastic so as to make the functional divisions such as bureaux to conform with the local needs instead of following a standardized formula irrespective of needs; it created new offices of Deputy-Governor and Provincial Counsellor; it abolished the Harbin Special Municipality and incorporated it into the city of Harbin, thus limiting the "Special Municipality" system to Hsinking only; it created ten new cities, namely, Antung, Fushun, Yingkou, Anshan, Ssupingkai, Liaoyang, and Tiehling in anticipation of the relinquishment of Japan's extraterritorial rights within the S.M.R. Zone, and Mutankiang, Chinchou, and Chiamussu; it left the organization and functions of Chi untouched; it instituted a Police Bureau in each city; it created a fourth District Postal Administration Office at Chinchou and prepared the way for the expansion of city and village postal functions in anticipation of the relinquishment of Japan's extraterritorial rights.

National Defence

History The Manchurian army has its origin in the Lilan army which rendered great services in founding the Ching dynasty. The soldiers of this army were since then hereditary and were garrisoned in various important points. After the Chinese Revolution of 1911 the army was modernized, and in Manchuria, there were stationed two divisions of the 27th and 28th numbering from 30,000 to 40,000. When Chang Tso-lin came into power, he increased it to 200,000, which was again increased by his son to 260,000 regulars with an additional 100,000 held as provisional forces. There was kept also a small fleet of 7 gunboats to protect trade carried on the rivers. These were the military forces in service under Chang Hsueh-liang at the time of the outbreak of the Manchurian Incident.

Present Status The army and navy of the empire is under the supreme command of the Emperor, and is garrisoned in defence of particular districts prescribed by the Emperor.

The Defence Department of Manchoukuo combines both services of army and navy having the following bureaux and sections:

(1) Staff Bureau, (2) Supplies Bureau, (3) General Affairs Section, (4) Justice Section, (5) Personnel Section, (6) Survey Section, (7) Accounting Section, (8) Auditing, (9) Naval Administration, and (10) Armaments Section.

Besides there are the Military Advisory Board, where a number of Japanese officers are engaged who direct the military administration and the Investigation Board which engage in the investigations into the subjects of military affairs and also in propaganda.

STANDING ARMY

The military forces at various points are:

1. The Imperial Guards
2. The Seian Force
3. The Flying Corps
4. The Gendarmerie Corps
5. 1st Brigade in command of 1st military district
   2nd " " " " 2nd " "
   3rd " " " " 3rd " "
   4th " " " " 4th " "
   5th " " " " 5th " "
6. Kirin army
7. Heilungkiang army

The army numbers 80,000. As to the coastal and river defence, the country maintains 11 gunboats and 4 other vessels.

Foreign Relations

With Japan (1) Recognition by Japan. Japan is the only country with which Manchoukuo is exchanging envoys. Her relation with Japan is defined in the Japan-Manchoukuo Protocol signed on September 15, 1932, between the two countries at Hsinking, providing for their mutual defence. (See p. 205) The document is also notable for the fact that by virtue of it, Japan accorded recognition de jure to the new state far ahead of other nations.

(2) Emperor Kangtê's visit to Japan. In June, 1934, Prince Chichibu was sent to the Empire to convey the Imperial Message of Congratulation to the Emperor and Empress of the new state. In return for this, the Emperor Kangtê paid a visit to Japan, arriving in Tokyo on April 6, 1935, and made a formal call on the Emperor of Japan on the same day. He stayed till April 24.

(3) Abolition of Extraterritorial Privileges. Manchoukuo has confirmed, by the Japan-Manchoukuo protocol, the extraterritorial privileges which Japan had been enjoying under treaties with China. But the development and progress of the country, since its founding, in all branches of administrative system, which are connected with extraterritoriality, for instance, in judicial, police and taxation systems have been noteworthy. In fact more than ¥8,000,-

Digitized by Google

000 was set up for the reform of these systems in the budget for 1934. Accordingly Japan decided to give up the rights of extraterritoriality and obtained the Imperial sanction for doing so on August 9, 1935.

The second treaty that completely abolished Japan's extraterritoriality in Manchoukuo was signed on November 5, 1937, only a year after the first. This Japan-Manchoukuo treaty transferred completely all administrative rights in the railway zone. It covered judicial, police, and other matters not covered in the first treaty, and went into force on December 1, 1937, when the formal abolition and transfers took place.

In the Kwantung Bureau, the Police Department was abolished with the transfer of Japanese police forces to Manchoukuo and the Education Department was created to supervise School Associations and Federation of School Associations which took over Japanese educational activities in Manchuria. In the Kwantung District Government, all offices including police and postal services which were operating in the S.M.R. Zone were transferred to Manchoukuo, two Departments of Finance and Civil Engineering were added, and the Dairen Civil Administration Office was abolished, placing the City of Dairen under the direct supervision of the Kwantung District Government which was already moved from Port Arthur to Dairen. Moreover, various activities of purely Japanese character which were carried on by post offices in the S.M.R. Zone were entrusted to similar Manchoukuo post offices for the time being.

Another far-reaching result of the relinquishment of extraterritoriality, including consular jurisdiction, was the abolition of several Japanese consulates in Manchoukuo. This decision was announced by the Japanese Embassy in Hsinking early in January, 1939. The shift included the abolition of Consulates-General at Mukden, Kirin, and Tsitsihar and Consulates or branches at Antung, Chinchou, Chengte, Chihfeng, Paichengtzu, and Yenchi, leaving open for the time being the Consulates-General at Hsinking and Harbin and Consulates in Northeast Manchuria. The Mutankiang Branch of the Harbin Consulate-General and the Hunchun Branch of the Yenki Consulate were raised to the status of a regular Consulate in view of the growing importance of north-eastern frontiers.

(4) Japan-Manchoukuo Economic Agreement. The agreement regarding the establishment of a joint Japanese-Manchoukuo economic commission was signed on July 15, 1935, at Hsinking by General Jirō Minami, Ambassador to Manchoukuo and commander of the Kwantung Army, and Mr. Chang Yen-ching, Foreign Minister of Manchoukuo. The object of the agreement is to extend to the economic field the inseparable relations between Japan and Manchoukuo that already exist in the defence and diplomatic fields and to accelerate the formation of the economic bloc between the two countries.

With Soviet Russia (1) Purchase of N.M.R. In view of ceaseless troubles concerning the North Manchuria Railway, Soviet Russia proposed to Manchoukuo to dispose of the railway. The first conference was opened at Tokyo in June, 1933, between the representatives of Manchoukuo and Soviet Russia with a few Japanese officials attending the parley. On account of the great disparity of opinions as to the value of the railway the conference had not proceeded smoothly until, at last through the mediation of Mr. Hirota, then Foreign Minister of Japan, Soviet Russia finally came to agree on March 23, 1935 to transfer the railway to Manchoukuo at ¥140,000,000. Frontier troubles between Soviet Russia and Manchoukuo are incessant, becoming quite major events at times. The descriptions are given in Chapter VI.

With Great Britain and the U. S. A. The Manchoukuo Government decided to make the Petroleum Monopoly Law effective as from April 10, 1935. The governments of Great Britian and America protested against Japan stating that the above law infringes the principles of the Open Door and Equal Opportunity established by the Nine-Power Treaty. The Japanese Government replied that it was an independent action of the state of Manchoukuo, and that Japan could do nothing about it. The reason of the protest of the British and American Governments was that the capital invested in petroleum in Manchoukuo by their nationals would be practically expelled from the country by the coming into force of this law. But the Manchoukuo Government had to issue this law to effect control over its principal industries which were absolutely necessary for her development, with no aim to expel foreign capital.

With China (1) Postal and Railway Business. Manchoukuo, when she proclaimed her independence on March 1, 1932, notified China that her relation with the latter would be the same as with any other power, and declared that she would take over the business of

Digitized by Google

postal service on the 20th of the same month. The country made new stamps and post cards, and had actually taken over the postal business on July 25 1932. Matters in connexion with the revival of the postal business which had been pending between Manchoukuo and China were satisfactorily settled and ordinary mail service was opened between the countries as from January 10, 1935, and that on money order and parcels as from February 1. As regards cables the negotiation came to a satisfactory conclusion on October 17, 1935. As to the collection of customs duties, the business was also taken over by the Manchoukuo Government on September 25.

The question of railway, which was another important problem, came to a satisfactory solution on June 28, 1934, and the railway connection which had been severed for 2 years and 9 months since the occurrence of the Manchurian Incident was restored. Since July 1, 1934, one train each from Peiping and Mukden is being despatched every day.

(2) Exchange of Amity Commissions. The East Hopei régime decided to enter into formal relation with Manchoukuo. A goodwill commission was sent by the East Hopei Anti-Communist and Autonomous Government headed by Chih Tsung-mo which formally presented to Foreign Minister Chang Yen-ching of Manchoukuo a personal letter from Mr. Yin Ju-keng, chairman of the Tungchow Council, voicing a desire for friendship and amity with Manchoukuo. The commission was received in audience by the Emperor Kangtê on the 17th. In return the Manchoukuo Government despatched an amity mission of six headed by Mr. Kao Chung-lu which delivered a letter of amity signed by Foreign Minister Chung Yen-ching to chief Executive Yin Ju-keng on May 18.

With the occurrence of the China Affair Manchoukuo's relation with China is undergoing a radical change.

With Germany The German economic mission to East Asia headed by Dr. Otto Carl Kiep arrived at Hsingking on February 32, 1935. Since then the commission made a study of economic conditions in Manchoukuo, and later proceeded to Tokyo to take up the subject of concluding a treaty with Manchoukuo through the intermediation of Japan. As the result an announcement of the conclusion of a German-Manchoukuo trade agreement was made by the Manchoukuo Embassy on May 1, which was signed on April 30.

Formal Recognition. In his address delivered before the Reichstag on February 20, 1938, Chancellor Hitler declared that Germany would formally recognize Manchoukuo, the following being a summary of his speech concerning Germany's foreign policy :

1. On no account will Germany become entangled in conflicts in which the nation itself is not interested. Germany will remain neutral.

2. Germany demands the return of her colonial possessions. Therefore Germany will never re-enter the League of Nations which deprived her of her colonies.

3. Germany will recognize Manchoukuo.

4. Germany will extend moral support to Japan in the present Sino-Japanese conflict.

5. Germany will further buttress the Japan-Germany-Italy Anti-Comintern Pact against Soviet Russia.

Thus, Germany's recognition of Manchoukuo, which had been expected since the conclusion of the Japan-Germany Anti-Comintern Pact, was realized at last.

Five days later, Dr. Knoll, Reich Trade Commissioner in Hsinking, paid a visit to Mr. Chang, the Prime Minister of Manchoukuo, and announced that Germany's recognition of Manchoukuo would take effect from February 20, 1938, the day Chancellor Hitler made his speech referred to above.

Treaty of Amity. On May 12, 1938, Germany extended formal recognition to Manchoukuo when a treaty of amity was signed in Berlin, inaugurating diplomatic relations between the two States. The historic document was signed by Baron Ernest von Weizsaecker, State Secretary for Foreign Affairs, on behalf of the Reich, and Mr. Hiyoshi Kato, Manchoukuo's Plenipotentiary in Berlin, at the German Foreign Office. The treaty is composed of four articles and will come into force on the day when ratifications are exchanged between the Reichsfuehrer and His Majesty the Emperor of Manchoukuo. The treaty is as follows:

Article 1. Both countries, on an equal and independent footing, shall exchange Consuls to establish diplomatic and consular relations. The said Consuls shall be accorded equal treatment with the Consuls of other countries under the most-favoured-nation terms.

Article 2. Both countries shall be granted the freedom of residence, travel and business for their respective

Digitized by Google

nationals, for whose lives and property the two Governments undertake to provide protection.

Article 3. The two Governments agree to open, immediately after the signing of the present agreement, negotiations for the conclusion of a general treaty of trade and navigation with a view to promoting friendly relations.

Article 4. The text of the present treaty is prepared in duplicate in the German and Manchou languages. The treaty shall enter into force on the date when ratifications are exchanged between the Reichsfuehrer and the Emperor of Manchoukuo.

With Italy It must be recalled that the Italian Government, with the view to helping the maintenance of peace in the Far East gave de facto recognition to the Hsinking Government when it re-opened its consulate in Mukden on December 1, 1936. Italy once more manifested an admirable power of penetrating observation on the state of affairs in East Asia by announcing de jure recognition of Manchoukuo on November 29, 1937. Italy named her first minister to Hsinking in January and Manchoukuo hers in February, 1938. The treaty of amity, commerce and navigation was concluded on July 5, 1938.

Manchoukuo Joins Anti-Red Pact The historic signing of the protocol for Manchoukuo's participation in the Anti-Commintern Agreement took place in the flag-bedecked auditorium of the State Council Building in Hsinking on February 24, 1939, between the Manchoukuo plenipotentiary, Premier Chang Ching-hui, and the plenipotentiaries of Japan, Italy and Germany, Ambassador General Kenkichi Uyeda, Minister Luigi Cortese and Minister Wilhelm Wagner, respectively, the ceremony beginning at 10 a.m. Simultancously a similar protocol was signed in Budapest whereby Hungary also formally entered the anti-Red pact. Both protocols are based upon the German-Japanese Agreement on Communism and its supplementary protocol signed in Berlin on November 25, 1936, and the Japan-Germany-Italy Protocol signed in Rome on November 6, 1937.

Diplomatic Relations with Dominica On August 16, 1934, the President of Dominica presented his autograph letter to the Emperor of Manchoukuo through the Foreign Office of that country, in return for which the Emperor sent his dated January 21, 1935, to the President. The Foreign Minister of the Republic therefore sent a letter of appreciation to the Emperor through the Foreign Office of Manchoukuo, and in this manner diplomatic relations between the two countries have been established.

Recognition by Salvador On March 3, 1934, the Republic of Salvador declared that she would recognize Manchoukuo as an independent state.

Recognition by the Holy See Under date of April 18, 1934, the Holy See notified the Manchoukuo Government of its decision to form a separate mission field in Manchoukuo, independent from that of China, and appointed the Rt. Rev. Bishop A. Gaspais as Acting Apostolic Delegate in Manchoukuo with the intention to contribute to the moral and intellectual development of the country according to the disposition of the Manchoukuo authorities. The notice was confirmed on August of the same year by His Eminence Pierre Cardinal Fumasoni-Biondi, prefet de la S. Congregation de la Propagande.

Recognition by Nationalist Spain The Manchoukuo Government took steps to recognize the Franco Government in Spain and the latter did the same with regard to Manchoukuo. Official notes to the above effect were exchanged at Tokyo on December 2, 1937. This move, as the notes clarified, is another step toward the strengthening of an international united front against the destructive policies of the Third International.

Recognition by Hungary The Hungarian recognition of Manchoukuo was officially communicated to Hsinking on January 10, 1939, by Foreign Minister Csaky of Hungary. Premier Chang Ching-hui immediately replied and extended the official recognition of Hungary by the Manchoukuo Government.

Recognition by Poland The Governments of Manchoukuo and Poland on February 5, 1938, completed arrangements for the establishment of Polish Consulate in Harbin. Informal conversations between the representatives of Manchoukuo and Poland were carried on at Tokyo through the good offices of the Tokyo Foreign Office for the purpose of concluding a treaty of amity between the two countries. General agreement was reached in October and notes were exchanged under the date of October 19, 1938, for according to each other on condition of reciprocity the most-favoured-nation treatment in diplomatic and commercial relations. Poland thus accorded a de facto recognition to Manchoukuo.

Passport Visé Meanwhile, the Department of Foreign Affairs of Manchoukuo assiduously endeavoured to

Digitized by Google

pave the way for the opening of diplomatic relations with European and American countries, and promulgated new regulations governing the granting of passports and their visés effective June 1, 1933, and otherwise took steps to provide travelling facilities for foreigners.

Simultaneously with the enforcement of the new regulations, the Manchoukuo Foreign Office opened four passport offices in Antung, Dairen, Yingkow and Suifeng on June 1 to which Shanhaikwan, Manchuli, Tumen, Heiho and Kupeikou were added later, pursuant to the stipulations of the said regulation. Between June 1, 1933 and September 30, 1934, a total of 11,395 passports of foreigners entering or passing through the country were examined and viséd, an average of 950 a month.

Manchoukuo Consulates Another event worth mentioning in connection with Manchoukuo's foreign relations was the opening of the Manchoukuo consulate at Blagoveschensk, the first consulate to be established in a foreign country by the new nation, late in September, 1932. Mr. Kuei Heng-chin was appointed in charge of this consulate.

The number of Manchoukuo residents in Blagoveschensk, which is a Soviet city located near the Siberian border on the bank of the Amur River on the opposite side of Heiho, a Manchoukuo town, is approximately 7,000, most of them being engaged in the retail business.

Manchoukuo's second consulate in Soviet Russia was opened at Chita in January, 1933, the staff being headed by Mr. Li Yuan as consul.

Also the consulate at Shingishu, Korea, the first of the kind to be established in the Japanese Empire, was opened on November 9, 1934.

Exchange of Ambassadors The recognition of Manchoukuo by Japan on September 15, 1932, was acknowledged by the despatch of Pao Kuan-cheng to Japan by the Manchoukuo Government, to stay in Tokyo as Manchoukuo's representative, towards the end of the same month, and later by the visit to Tokyo of the Foreign Minister of Manchoukuo, Hsieh Chieh-shih, in November, 1932.

Meanwhile General Nobuyoshi Muto, commander of the Kwantung army, ambassador to Manchoukuo and governor of the Kwantung Leased Territory, who signed the Japan-Manchoukuo Protocol on September 15, 1932, presented his credentials as ambassador to the Chief Executive of the country.

This was followed by the arrival of General Ting Shih-yuan on May 10 in Tokyo as the first Manchoukuo Minister to Japan. Meanwhile Manchoukuo desired to elevate the legation at Tokyo to the status of an embassy in view of the increasing importance of her relation with Japan, which was endorsed by Japan on May 21, 1935. The first ambassador of Manchoukuo to Japan was Mr. Hsieh Chieh-shih, the former minister of Foreign Affairs.

Shortly after the conclusion of the Jehol expedition, Marshal Muto, to which rank he was promoted, fell ill in Hsinking and died on July 27. He was succeeded at his post by General Takashi Hishikari, and then by General Jirô Minami. The latter resigned and the post was taken by General Kenkichi Uyeda in March, 1936.

Diplomatic Representations Japan is the only nation which has an embassy in Manchoukuo. Consulates established by Japan and other Powers in that country and their locations follow:

Japanese Embassy at Hsinking.
Japanese Consulates-General at Hsinking, and Harbin.
Japanese Consulates at Yingkow, Tsitsihar, Paitsokuo, Tunghua, Hailung, Taolu, Hunchun, Manchouli, Chengchiatun, Toutaokou, Hsinminfu, Hailar, Suifenho, Yenki, Tumen, Tunhua and Mutankiang.
British Consulates-General at Mukden and Harbin.
British Consulate at Yingkow.
American Consulates-General at Mukden and Harbin.
French Consulates at Mukden and Harbin.
U.S.S.R. Consulates-General at Mukden and Harbin.
U.S.S.R. Consulates at Tsitsihar, Heiho, Suifenho and Manchouli.
German Consulates at Mukden and Harbin.
Italian Consulate at Harbin.
Dutch Consulates at Harbin and Yingkow.
Belgian Consulate at Harbin.
Danish Consulate at Harbin.
Norwegian Consulate at Yingkow.
Polish Consulate at Harbin.
Czechoslovak Consulate at Harbin.
Portuguese Consulate at Harbin

At Dairen, Kwantung Leased Territory

American Consulate
British Consulate
U.S.S.R. Consulate
German Consulate
French Consulate
Dutch Consulate
Swedish Consulate
Finnish Consulate
Belgian Consulate
Estonian Consulate
Norwegian Consulate

Finance

While the finance under Chang Tso-ling was comparatively sound in his earlier administration, the expenditure commenced to increase steadily due to his army being enlarged in the latter days. Thus in 1926, the total expenditure was ¥120,000,000 and showed a budgetary deficit of ¥12,000,000. When he was succeeded by his son, Chang Hsueh-liang, the deficit was further increased. The recklessness of his finance was evidenced by the fact that, of the total expenditure of ¥142,500,000, the sum defrayed for the military purpose amounted to ¥114,720,000. The deficit thus created was met by increased taxes and inflation of currency, thereby causing the people great misery.

In view of the deplorable state of affairs, as above stated, the leaders of Manchoukuo directed their efforts for the stabilization of the financial conditions of the country without increasing tax economic pressure on the people. It is much to the credit of the new state that such a rapid and sound development has been made in finance and currency in so short a time.

Manchoukuo's national budgets since its foundation follow :

MANCHOUKUO'S NATIONAL BUDGET

(In M¥1,000)

	Revenue			Expenditure		
	Ordinary	Extra-ordinary	Total	Ordinary	Extra-ordinary	Total
1932	97,386	15,922	113,308	104,482	8,826	113,308
1933	132,134	17,035	149,169	107,449	41,720	149,169

1939	299,837	103,540	403,377	182,033	221,344	403,377

Note: Manchoukuo's fiscal year corresponds with the calendar year.

Manchoukuo's Budget for 1938 and 1939 The State budget for the fifth fiscal year of Kangtê covering the period from January 1 to December 31, 1938, was published in the Official Gazette December 28, 1937.

Compiled on the principle of rational and positive finance, the new budget is designed, inter alia, to adapt the country to the situation brought about by the China Incident. It aims in the main to effect, by mobilizing all internal facilities, the strengthening of national defence, promotion of the nation's producing capacity and efficient collaboration with Japan in the adjustment of international receipts and payments, besides ensuring a smooth working of the various arrangements instituted to cope with the new situation arising from the abolition of extra-territoriality by Japan.

Much the same general trend governed the formulation of the 1939 budget now in force. This year, the Government is seeking some 396,428,000 yuan through the floatation of loans. Of this amount 42,300,000 yuan have been assigned to the new special account known as the Colonial Development Enterprise Special Account for various subsidized activities in connection with Japanese and Chosenese immigration. Of the balance, 250,000,000 yuan are taken up by the Investment Special Account, 30,000,000 yuan by the Hydro-Electric Power Enterprise Special Account, and 65,000,000 yuan by the General Accounts.

Government Monopolies In Manchuria, prior to the foundation of the new State, the production and sale of salt and matches were government mono-

Digitized by Google

polies. These monopolies, however, were not national, but provincial in character, without any uniformity or connection between each provincial system, for the four provinces that made up the so-called Northeastern régime in those days, were to all intents and purposes, separate entities, with their own laws and regulations.

Seven years have elapsed since the system of national monopolies was inaugurated in Manchoukuo, and along with the establishment of various other national systems, it has been gradually improved and expanded. Beginning with the promulgation of the Opium Law in 1932, an oil monopoly system was enforced in 1935, while salt and matches were made Government monopolies in 1937. The system which the Manchoukuo Government has temporarily adopted with regard to the sale of matches during the first five years was known as public sales system, a combination of taxation and monopoly systems. Under this system, the Government supervised the manufacture and distribution as well as retail business of matches but the public sale was entrusted to the Manchuria Manufacturers' Association, the wholesale dealers paying tax to the Government according to the amount of business handled. This system contained many defects and the Government has instituted investigations for the purpose of revising the system fundamentally. The result was the formulation of the Match Monopoly Law which was promulgated on December 26, 1936, and enforced from February 16, 1937. Under the new system, any person who wishes to manufacture, import, or export matches is required to obtain a permit therefor from the Government, while all matches manufactured or imported automatically become Government monopoly products, which must be sold to the Government in return for fair compensation. As in the other cases of monopoly products, the wholesale trade in matches is limited only to those who are licenced and designated by the Government.

The alcohol monopoly was instituted on January 1, 1938. It was designed to ensure the economical production of alcohol, to develop the use of alcohol in mixed liquid fuel, and to encourage the production and consumption generally. The monopoly alcohol contains 90 per cent or more pure alcohol, either absolute alcohol or hydrous alcohol, and a drastic control is placed over the alcohol with less than 90 per cent content. The manufacture, importation, or exportation of alcohol, as in other cases, are carried on under the Government licence system and all alcohol manufactured or imported, with the exception of export alcohol in transit and alcohol for special purposes, is expropriated by the Government. The distribution is made by the Monopoly Office through licenced dealers. As Manchoukuo has various grains suitable for making alcohol and also sufficient manufacturing equipments to meet the domestic demand with considerable surplus, the Government has adopted the policy of restricting importation and encouraging exportation of alcohol. Thus, the manufacturers of shaochiu, a popular native drink which is distilled by a primitive method from a mixture of kaoliang, corn, Indian beans, and millet, are required to use the monopoly alcohol, while the manufacture of so-called "new saochiu," a mixture of ordinary shaochiu and alcohol, has been prohibited.

The opium monopoly had as its fundamental purpose the extermination of opium evil through national control. In this respect, the reexamination of the system in 1934 and further study of the problem in general finally led the Government in August, 1937, to discard the policy of gradually eliminating addicts and to adopt a new policy of completely exterminating the habit within a period of ten years beginning in 1938. The ten-year plan for the extermination of opium evil as announced on August 12, 1937, outlined an elaborate programme including (1) education against opium-smoking, (2) prevention of the appearance of fresh cases, (3) curing of addicted persons, (4) control and improvement of opium to be used in the treatment of addicts, (5) self-restraint of Government and municipal officials, and (6) rigid control of production, buying, and selling of opium in conformity with the policy of eradicating opium smoking. Simultaneously with the strengthening of the opium monopoly, the Government has decided to ban the use of narcotic drugs. Consequently, the Narcotics Law was promulgated in August, and enforced from September 15, 1937. The narcotic administration under the Narcotics Law is primarily under the jurisdiction of the Health Department but, as the opium from which narcotic drugs are manufactured is a monopoly product, the manufacture, importation, and distribution of morphine and heroin were placed under the supervision of the Monopoly Office.

The national revenue from the mo-

Digitized by Google

nopoly products grew from 6,063,000 yuan for the year 1933-34 to 11,389,000 yuan for 1934-35, 6,373,000 yuan for 1935 (6 months), and 20,116,000 yuan for 1936. The addition of salt and match raised the budgetary estimate for 1937 to 44,368,000 yuan, the further addition of alcohol increased the budgetary estimate for 1938 to 52,325,000 yuan, and that for 1939 to a new record sum of 76,608,000 yuan or 12 times the net profit of 1933-34. In other words, the monopoly profit in 1933-34 amounted to only 3 per cent of the total net revenue but in the 1939 budget it rose to 17 per cent of the total estimated national revenue. With the progress of industrialization of the country, the monopoly profit is expected to increase further.

Banking

Central Bank of Manchou This bank was established on July 1, 1932, and it opened business on the same day. In it were included four old banks of issue, the Three Eastern Provinces and the Frontier Bank. It has its head office at Hsinking, and branch offices at Mukden, Kirin, Tsitsihar and Harbin. It is capitalized at M¥30,000,000, and the Manchoukuo government hold more than 50,000 shares of M¥100 each. It is authorized to mint coins and issue notes. The general balance sheet of the bank amounted to M¥913,813,000 at the end of 1938.

Currency Problem The currency in Manchoukuo has been in an extremely complicated condition, native and Japanese and other notes and coins being in circulation. But in the newly regulated system of Manchoukuo currency 23.91 grammes of pure silver is taken as the unit called the yuan, there being 100 fen or 1,000 li in one yuan. The new paper notes are issued in five different denominations of 100 yuan, 10 yuan, 5 yuan, one yuan and chian, or 50 fen, circulated together with 1-chiao and 5 fen nickels and 1-fen and 5-li coppers. The amount of coins issued by December, 1938, reached M¥27,158,869.

Note Issue Before opening for business on July 1, 1932, the Central Bank of Manchou took over old notes of 15 different kinds and 136 denominations amounting to M¥142,234,881 calculated in the new currency at the exchange rate fixed officially. This figure was gradually reduced and by the end of June, 1935 a total of M¥138,200,000 or 97.2% had been redeemed by the Bank. The amount of the notes in circulation at the end of December, 1938, reached M¥425,738,000.

Industrial Bank of Manchou This bank was founded in accordance with the Industrial Bank of Manchou Law issued by the Manchoukuo Government on December 3, 1936. Its capitalization is ¥30,000,000, a half of which is invested by that Government. Its object is to supply capital necessary for industrial development of Manchoukuo, and the domain of its business is not only limited to supply of capital to commerce, but to large and small industries on a basis of long-term and low interest rate. The bank is vested with authority to issue industrial debentures 15 times its paid-up capitalization. The Manchoukuo Government will guarantee for payment of principal and interest of loans for the bank, when the latter intends to raise necessary loans by floatation of its debentures abroad. Its president is Mr. Yutaro Tomita. Its head office is in Hsinking and branches in various cities of Manchoukuo. The general balance sheet of the bank amounted to M¥587,590,953 at the end of 1938.

Other Banking Institutions Though the Central Bank of Manchou occupies the controlling position in the monetary market as the note issuing bank, there are other banks which do substantial banking business. The names and capitalizations of the principal banks follow:

Name	Authorized Capital
(1) Manchoukuo Banks	
Fentien Commercial and Industrial Bank	M¥2,200,000
Fentien Commercial Bank	1,000,000
Yingkow	1,000,000
Kung Cheng "Yu Bank"	500,000
Tungpien Industrial Bank	1,500,000
I Fa Bank	1,000,000
I Tung Commercial Bank	1,000,000
Hui Hua Bank	250,000
(2) Japanese Banks	
Yokohama Specie Bank	¥100,000,000
Bank of Chosen	400,000,000
Shoryu Bank	12,000,000

(3) Chinese Banks	
Central Bank of China	25,000,000
Bank of Communications	10,000,000
Chin Cheng Bank	10,000,000
Ta Chung Bank	4,000,000
(4) Other Foreign Banks	
Russo-Asiatic Bank	R65,000,000
The Far Eastern Bank	$5,000,000
Hongkong Shanghai Banking Corporation	$5,000,000
National City Bank of New York	$150,000,000
The Chartered Bank of India, Australia & China	£3,000,000

To aid the sound development and

Digitized by Google

proper control of banking, the Government promulgated a new Banking Law in November, 1933.

Encouraged by the favourable results of the two credit associations which were created in 1932 in Fengtien province the Finance authorities in 1933 inaugurated eight similar associations in Fengtien, two in Kirin and one in Heilungkiang province. In 1934, 39 more such associations were established and preparations have been made for the establishment of 30 others during 1935.

Coupled with the credit associations referred to above, the Government is planning to grant special licences to chartered banking firms for the issue of premium bonds whereby they may be able to advance long-term low-interest loans to farmers and small industrialists.

The Government also is planning to create and subsidize a larger number of credit associations for the specific purpose of improving the finances of small and middle class farmers, merchants and minor industrialists. Such association would be subject to appropriate regulations and supervision by the Government. At the same time the Government is planning to assist and exercise necessary control over pawnshops.

Industrial Expansion of Manchoukuo

Five-Year Industrial Plan

On March 1, 1933, the Manchoukuo Government proclaimed the "General Outline of the Economic Construction Programme of Manchoukuo" and enunciated its national economic policy of control, and in cooperation with the Japanese Government, it began to draw up the second-period construction programme. The new programme was ready by the end of 1936 and the Government announced the outline of new five-year construction programme at the Provincial Governors' Conference in January, 1937. The second-period construction programme, requiring a huge expenditure of two and a half billion yuan, is designed to meet the need of strengthening the Japan-Manchoukuo economic bloc and to enable Manchoukuo to develop resources necessary for her national defence and for the eventual establishment of self-sufficiency of goods for consumption within the country as well as to supplement the resources of Japan. The nucleus of this programme is the Five-Year Industrial Plan which aims (1) to establish and expedite important industries and (2) to promote national economy.

The second-period Five-Year Industrial Programme calls for the development of natural resources and such industries as coal mining, iron mining, and coal liquefaction.

Coal Mining Coal, with an estimated deposit of over ten billion metric tons, is one of the most important mineral products of Manchoukuo. The Government has decided to raise the capital of the Manchuria Coal Mining Company, a Japan-Manchoukuo joint enterprise, from 16,000,000 yuan to 80,000,000 yuan.

It will enable the country to increase the annual production of coal to 24,600,000 tons during the next five years. This will necessarily require opening up of new mines. In 1931, the year before the birth of Manchoukuo, the domestic coal output amounted to 9,200,000 tons, of which 6,520,000 tons or 70% were mined at the Fushun Colliery. In 1935, the production reached 11,670,000 tons including 8,380,000 tons of Fushun coal, an increase of 2,470,000 tons over the 1931 output. These figures indicate that the increase of coal output since 1931 was chalked up principally at the Fushun Colliery and naturally the new five-year programme aims to increase chiefly the output of the mines operated by the Manchuria Coal Mining Company. The most encouraging recent discovery of large deposits of coal in the so-called Tungpientao region or the southeastern section of the country along the Chosen border, including an estimated deposit of 50 million tons at Yentungkou, 10 million tons at Tiehchang, and 100 million tons at Wutaochiang, is believed to expedite the above programme tremendously.

Iron and Steel Manufacturing. The Five-Year Industrial Plan also gives primary consideration to the iron industry. In this important field, however, Manchoukuo is still largely dependent upon foreign countries for its supply. Consequently the Five-Year Industrial Plan proposes to make Manchoukuo self-sufficient in iron, producing at least 2,350,000 tons of steel and 2,400,000 tons of pig iron together with 6,600,000 tons of iron ores. For this purpose, a systematic exploitation of her iron deposits, estimated at some 1,200 million tons, is projected along with the expansion of the Showa Steel Works at Anshan and the Penhsihu Iron Works on the Mukden-Antung Line, including the utilization of modern methods of ore refining to boost the domestic production of the metal. The providential impetus given to this programme has been the discovery of extensive iron deposits in the Tungpientao region. It is estimated that these deposits, counting only those already ascertained, amount to 1,200 million tons of fine iron ores, including 78 million tons at Tali-

Digitized by Google

tzukou, 5 million tons at Chitaokou, 100 million tons at Laoling, and no less than 1 billion tons in a vein covering 40 kilometres from Pataochiang to Ertaochiang.

Liquefaction of Coal The rapidly increasing domestic demand for liquid fuel and the dearth of petroleum resources in the country have directed Manchoukuo's attention to the manufacture of substitute liquid fuel through the process of liquefying coal. Manchoukuo is fortunately well-equipped for this purpose as she is endowed with an almost inexhaustible supply of coal. As a first step in this direction, a coal hydrogenation plant is under construction at Fushun, the site of the world-famous open-cut coal mine and new plants will be built at Fushin in Chinchou Province, Holung in Chientao Province, and Ssupingkai in Fengtien Province. The largest of this group, the projected company at Fushun will be a Japan-Manchoukuo joint enterprise capitalized at ¥50,000,000. Moreover, the Government is giving every possible assistance to the expansion of the oil shale industry at Fushun and additional plants are now under construction to double the present capacity. A new plant is also planned at Sanhsing. The Five-Year Industrial Plan proposes to produce 500,000 tons through the liquefaction of coal and 800,000 tons from the oil shale. In addition, alcohol as a substitute liquid fuel is to be produced on a far larger scale than at present.

Light Metallic Industry Manchoukuo is rich in resources for the light metallic industry and the magnesium and aluminium manufacturing industries have sprung up. In the districts around Tashihchiao, a huge deposit of excellent magnesite ores, estimated at 1 billion tons, is found. In order to exploit the magnesite deposits there, the Manchuria Magnesium Company has been established with an authorized capital of 7,000,000 yuan. The Company has two large plants in Japan and manufactures metallic magnesium out of Tashihchiao magnesite ores. Raw materials for the manufacture of aluminum, particularly aluminum shale, are also found abundantly in Manchuria and the aluminum manufacturing in Manchoukuo holds bright prospects. The Manchuria Aluminum Manufacturing Company has been incorporated in 1936 with an authorized capital of ¥50,000,000 and its plants at Fushun has commenced their operation late in 1938. The Five-Year Industrial Plan calls for a production of 200 tons of magnesium and 20,000 tons of aluminum.

Electric Industry Owing to the almost inexhaustible coal deposits in Manchuria, electricity is generated entirely by caloric heat and nothing so far has been done to harness the vast hydraulic resources of the country which, it is estimated, are capable of generating a constant supply of 1,500,000 kilowatt of electricity. In order to meet an increasing demand for electric power in the country, a far-reaching plan for the development of hydro-electric industry under the State management has been worked out in conjunction with the Five-Year Industrial Plan. It proposes to generate 350,000 kilowatts by hydraulic power and to increase the present amount of 420,000 kilowatts by caloric heat to 850,000 kilowatts. For this purpose, three projects are now under way. The Government is constructing a huge reservoir, approximately 210 square miles in area, by damming the Second Sungari a short distance above Kirin and a large hydro-electric plant capable of generating 180,000 kilowatts of electric power. The first-stage construction programme will be completed in five years and the second-stage construction programme will raise the maximum depth of the reservoir by 12 metres and will increase the generating capacity of the plant to 200,000 kilowatts. This project, besides generating necessary electric power, also (1) will help prevent the inundation by floods of about 160,000 hectares of land in the lower reaches of the Sungari River and (2) will help irrigate extensive dry districts for farming. The second project is the establishment of the Yalu River Hydro-Electric Power Company with an authorized capital of ¥100,000,000 to be invested jointly by Japan and Manchoukuo. The Japanese and Manchoukuo authorities have reached an agreement to harness the waters of the Yalu River for the purpose of facilitating the industrial development of the Tungpientao District of Manchoukuo and North Chosen and a huge dam is now under construction. When the first-stage construction programme which is spread over three years and which calls for 500,000 kilowatts of electric power is completed, the Company's capital will be increased to ¥300,000,000 and the generating capacity to 1,500,000 kilowatts. The third project now under construction is a hydro-electric plant on the shores of the Chingpo Lake. It was started in 1937 and will be completed in 1939 when it will generate 30,000 kilowatts of elec-

Digitized by Google

tricity. In addition, three generating plants are being constructed by the Manchuria Electric Industry Company at Santankou, Hunchun, and Mutankiang which will add 50,000 kilowatts by caloric heat.

Pulp Industry Having completed a survey of the forest resources of North Manchuria, the Government has decided upon their immediate exploitation with the object of increasing the present production of some 60,000 tons to 300,000 tons of rayon pulp and 100,000 tons of paper pulp annually when the five-year program is completed. Of this projected amount of 400,000 tons it is planned to produce 300,000 tons from woods, 70,000 tons from reeds, and 30,000 tons from bean stalks through the joint participation of the four already existing wood pulp companies in East Manchuria, the Yalu River Paper Manufacturing Company, the Kangte Reed Pulp Company, and the Manchuria Bean Stalk Pulp Company. However this is considered still inadequate and the Manchoukuo Government is now taking steps to establish a large pulp company with an authorized capital of 100,000,000 yuan in order to exploit the rich forestry resources in the Great Hsingan and Small Hsingan Ranges and to produce some 230,000 tons of pulp.

Gold Mining The present gold production in Manchoukuo is around 10,000,000 yuan worth. Under the Five-Year Industrial Plan, the Government aims to increase the production to 200,000,000 yuan worth within the next five years. For this purpose various adequate steps will be taken to encourage gold mining, especially the production of alluvial gold.

Promotion of National Economy Agriculture is the backbone of Manchoukuo's national economy and the development of her national economy rests upon the prosperity of her rural communities. Consequently, the Government has been exerting every possible effort to rehabilitate the rural communities by increasing the output of agricultural products, improving their quality and farming methods, rectifying rural finances, and reorganizing the rural social structure in general. The agricultural communities, however, are as yet in an impoverished condition and the second stage construction programme has incorporated a Five-Year Agricultural Programme as a fundamental measure for the rehabilitation of rural communities.

The Five-Year Agricultural Plan aims to establish the diversified farming in place of the one-crop system of cultivating soya-beans in an effort to resuscitate rural economy. During the first year of its operation, it calls for a total expenditure of 5,000,000 yuan, comprising 3,000,000 yuan for the encouragement of an increased production and 2,000,000 yuan for the prevention of blight, the encouragement of the use of improved farming implements, the establishment of agricultural experimental stations the cultivation of new farming lands, and the training of agricultural instructors.

The principal agricultural products whose output is to be increased are wheat, rice, oats, barley, lucerne, kenafe (Manchurian hemp), flax, castor-beans, cotton, tobacco, sugar beets, soya beans, kaoliang, millet, and maize. Special attention is to be directed toward wheat growing in North Manchuria and cotton cultivation in South Manchuria.

Wheat The increased domestic production of wheat, demand for which is yearly increasing, is absolutely essential for making Manchoukuo self-sufficient in this product and for expanding the domestic flour-milling industry. The Five-Year Agricultural Plan proposes to increase the 1936 wheat crop by 10 per cent to 1,100,000 hectares during 1937 and some 320,000 yuan have been appropriated by the Government for this purpose. At the end of five years, an increase of the wheat area by approximately 80 per cent and the wheat production to some 2,024,000 tons is expected.

Raw Cotton A new Five-Year Cotton Cultivation Plan was launched in 1937 to replace the 20-year programme enforced since 1933 with the object of producing 250,000,000 kin (1 kin equals 1.32 pounds) of unginned cotton annually after 1941 from 180,000 hectares of cotton fields in South Manchuria. Special attention will be paid to the cultivation of upland cotton in place of the native variety which is to be replaced by the former eventually as the yield from the former is far greater than that from the latter. In this connection the increasing activity of the Manchuria Cotton Association and the Manchuria Cotton Company looking forward to a complete revolution in cotton cultivation in South Manchuria is anticipated.

Kenafe Though new in Manchoukuo, the cultivation of kenafe shows much promise of developing into an important industry in the not far off future. In order to encourage its production among the farmers, the Department of

Digitized by Google

Industry in 1937 purchased some 8,000 yuan worth of kenafe seeds from the State-commissioned seed farms for distribution in Liaoyang-Hsien, Yingkou-Hsien, Haicheng-Hsien, Kaiping-Hsien, Fu-Hsien, Hsinmin-Hsien, Taian-Hsien, and Chin-Hsien. It is also planned to increase 1933 seed farm areas to 250 hectares in 1937.

Flax In order to meet the increasing demand for flax in Japan and Manchoukuo, plans have been drawn up also for boosting an estimated 1937 flax production of 15,000 tons to 70,000 tons at the end of a five-year period. This will necessarily expedite the domestic hemp manufacturing industry.

Stock-Farming Another important place in the Five-Year Agricultural Plan is assigned to the stock-farming. It aims to increase the existing breed of sheep, numbering some 3,000,000, to 4,200,000 and to produce some 4,740,000 tons of wool by introducing superior strains imported from abroad, such as Merinos and Coriedales from the United States and Australia, and by establishing adequate facilities. It plans to add some 400,000 heads of horses, 765,000 heads of cattle, and 260,000 heads of pigs. It also proposes to make an added effort in preventing and exterminating various forms of live-stock epidemics.

In cooperation with the Department of Industry, the Hsingan Affairs Office, until recently the Mongolian Administration Department, has also worked out a Five-Year Plan for the agricultural development of Mongolia through the introduction of modern methods of production and for the improvement and augmentation of the existing breed of Mongolian sheep. For this purpose several measures are being projected, such as the Hsingan Institute at Hailar for the training of veterinary surgeons, the establishment of sheep farms at Puhsi and Lupei and live-stock farms in banner districts, the opening of cooperatives communities, the encouragement of cultivation, and the readjustment of important facilities for the local farming industry.

Japanese Immigration The successful result attained by the Japanese farmer-immigrants during 1932-1936 has led the Japanese Government to initiate in 1937 a gigantic plan of settling I million Japanese households with 5 million members in twenty years. In view of the important part Japanese immigrants are destined to play in the second-stage construction programme, especially in promoting Manchoukuo's industrial development through an increased radius of cultivation, the Manchoukuo Government is planning to enlarge the scope of the Manchuria Colonial Development Company and other official and unofficial organizations concerned with Japanese immigration and to provide all available facilities for Japanese settlements.

Railways Undoubtedly the most noteworthy progress witnessed in Manchoukuo since 1932 is the development of railway transportation. Whereas there were about 5,500 kilometres of railways in all Manchuria in 1932, the total mileage has since almost doubled, now nearing 10,000 kilometres. It is not too much to state that this amazing development in the field of transportation and communication has become the vehicle upon which the second-stage construction programme is now progressing. Now that the fourth-stage railway construction programme has been launched to expand the radius of railway transportation farther afield, the Department of Communications is planning to build, in addition to the lines already projected, some 300 kilometres of new lines annually, chiefly in North Manchuria, during the next five years as well as to encourage the construction of about 1,000 kilometres of privately-owned railways by granting subsidies.

State Highways The Department of Communications is also planning to build some 13,000 kilometres of new State highways during the next five-year period beginning in 1937. At the same time, some 8,000 kilometres of roads already completed will be improved to facilitate transportation. The Department of Communications will continue the present policy of bus-line management under the Railway Directorate General of the South Manchuria Railway Company and bus service on all important highways will be extended and improved. The other bus lines will be left to private management.

Other Means of Communication As to the other means of communications, including erection of bridges and expansion of Rashin and Hulutao harbours, every effort will be made to develop them to meet the growing needs of the growing State.

Improvement of Financial Administration In line with the nature of the second construction programme, the Government has decided to follow the policy of avoiding an increase in general administrative expenditures and of setting aside the largest possible amount

Digitized by Google

of appropriations within the limits of sound finance for stabilizing and promoting the livelihood of the nation. It has also decided to resort to loan floatation as a source of revenue in financing undertakings for the development of industry. Inasmuch as taxes and Government monopolies have an important bearing upon the national economy, it has devised the following measures for the smooth realization of the second-stage construction programme.

Nation-wide coordination and readjustment in the internal taxation system had been effected in 1936 and the whole system has since been completely modernized. Further reform is now under contemplation to readjust the local taxation system, the customs, and the monopoly system so as to distribute the tax burdens equally and to provide elasticity to the financial resources of the nation.

The customs tariff has been revised several times since Manchoukuo took over the Maritime Customs with the result that the nation's trade continues to grow with a corresponding rise in customs revenue year after year. A fundamental revision of the customs tariff and an improvement in the customs clearance procedure are now projected with a view to promoting domestic industry, effecting a rational readjustment of Japan-Manchoukuo trade, and lightening the tax burden of the people.

The monopoly system of Manchoukuo was formerly confined to opium, petroleum, and a part of the salt output of the nation. Starting in 1937, the country's entire salt production and matches have been placed under the Government monopoly. As a result, the price of salt has been reduced from 10.16 yuan to 7.95 yuan per 100 kin. This reduction means a saving of approximately 6,000,000 yuan by consumers annually. Hereafter the Government will endeavour to readjust rationally the prices of monopoly products, to increase their output, and to facilitate their distribution with a view to effecting a smooth operation of the monopoly system.

The financing institutions play an important part in carrying out such an all-embracing construction programme. Naturally the Government plans to facilitate the smooth operation of financing business and to supply funds necessary for industrial development by giving full play to the functions of the newly established Industrial Bank of Manchou and the Central Bank of Manchou. At the same time, it will direct its efforts toward effecting general improvements in the ordinary banks, will establish additional Rural Credit Associations, will found Urban Credit Associations, and will increase their efficiency and lower their interest rates in order to help the financing of middle and small class commercial and industrial firms and rural communities.

Financing of Five-Year Programme Funds needed to finance the Five-Year Industrial Plan are two and a half billion yuan. Of this amount about 500 million yuan can be raised in Manchoukuo and the remaining two billion yuan will have to be raised in Japan. While there have been conflicting rumours as to the possibility of raising such an enormous sum, it was not believed impossible in view of the past Japanese investments in Manchoukuo and the recent financial condition in Japan. Japanese investments have amounted to almost 300 million yuan annually since 1933 and especially in 1935 they showed a sudden increase to 400 million yuan. Inasmuch as the Five-Year Industrial Plan aims at a general industrial development of the country, including the projects already decided upon, the necessary funds represent practically the total amount of investments to be made in Manchuria. Accordingly, for the execution of the plan only a small additional investment of 50-60 million yuan is needed above the average annual investment now being made normally in Manchoukuo. On the other hand, the successful completion of the Five-Year Industrial Plan, it is believed, will contribute greatly to the industrial development of both Manchoukuo and Japan, the promotion of trade between the two countries, as well as the improvement of the balance of their international payments.

Revision of Five-Year Plan It has been already pointed out that the sudden outbreak of the China Incident in July, 1937, was instrumental in indirectly retarding the progress of the Five-Year Industrial Plan during the first year of its operation. On the other hand, because of the China Incident, the outlook for the economic construction in Manchoukuo began to bear an added significance. In the first place, it became necessary to expand the productive activities in Manchoukuo from the point of view of Japan-Manchoukuo economic bloc to meet the new international situation in the Far East. In the second place, the new situation thus created demanded the em-

Digitized by Google

phasis of expansion in the mining and industrial fields more urgently than in the other departments. The result was the revision of the Five-Year Industrial Plan which was effected during the closing months of 1937 and the beginning of 1938. The gist of the Revised Five-Year Industrial Plan, which remains unpublished, is reported to be as follows:

The first Plan called for the production of 2,400,000 tons of steel at the end of five years. This goal was raised to 4,500,000 tons and, at the end of four years, it is hoped that Manchoukuo will be able to produce 3,500,000 tons of pig iron and 1,500,000 tons of steel materials, enabling her to export 2,000,000 tons of pig iron to Japan.

The first Plan projected the production of 25,000,000 tons of coal at the end of five years. This was increased under the revised Plan to 38,000,000 tons, of which 6,000,000 tons will be exported to Japan.

The first Plan called for the generation of 1,200,000 kilowatts of electricity at the end of five years. Under the revised Plan, this amount is increased to 2,600,000 kilowatts, equally divided between hydraulic power and caloric heat.

Through the increased utilization of reeds and bean stalks as well as woods, the revised Plan proposes to produce 400,000 tons of pulp, an increase of 100,000 tons over the first goal.

The first Plan looked forward to the production of 200,000,000 yuan worth of gold in five years but this amount was increased to 300,000,000 yuan worth in four years under the revised Plan.

In looking forward to the increased production of liquid fuel, 1,100,000,000 yuan instead of the original 320,000,000 yuan are appropriated for the preparation of this work.

Beginning with the increased production of roughly 1,000,000 tons of salt, the revised Plan hopes to increase the production of such minerals as aluminum, magnesium, lead, zinc, and copper as much as possible, at least doubling the present capacity.

In the field of agriculture, the most effort will be directed toward the eventual increase in the production of soya beans, amounting to at least 5,000,000 tons at the end of five years. As for the immediate future, the revised Plan hopes to increase during the first year 4,500,000 tons each of soya beans and kaoliang, 3,500,000 tons of millets, 2,300,000 tons of maize, 1,550,000 tons of wheat, 400,000 tons of rice, 210,000 tons of sugar beets, and 180,000 tons of barley.

As a necessary requisite for industrial expansion, the Government, the South Manchuria Railway Company, and the Manchuria Telephone and Telegraph Company will cooperate in realizing the first Plan and a revised Plan will be drawn up after a further study of the field.

In proportion to the proposed enormous increase in the production covering all fields of industrial activities, the necessary funds for the execution of the Revised Five-Year Industrial Plan had been increased from an original estimated sum of 2,500 million yuan to a new estimated amount of 5 billion yuan. Of this new estimate by far the largest items are 1,100 million yuan for liquid fuel, 700 million yuan for steel, 500 million yuan for electricity, and 300 million yuan each for coal and pulp. Other large items include 140 million yuan for agriculture and live-stock raising, 640 million yuan for transportation and communications, and 220 million yuan for immigration. Of this huge sum, 1,700 million yuan are expected to be raised in Manchoukuo and 2 billion yuan in Japan, while the balance is expected to be raised in other countries. With the rapid rise in prices, the projected estimates of 5 billion yuan may also rise to 6 billion yuan and special efforts will be directed toward the increased production of gold, the augmentation of export trade, and the importation of foreign capital.

The Five-Year Industrial Plan thus revised was put into force in the spring of 1938 and, undismayed by a serious shortage of capital and materials as well as an insufficiency of technicians and labourers, Manchoukuo moved forward to face the second year of this gigantic construction programme.

Results of the Second Year The Five-Year Industrial Plan during its second year of operation in 1938, according to the report of the Industry Department, on the whole, progressed smoothly. It achieved more than its desired results in the field of steel production and electric generation, while in the other fields of mining and manufacturing preparations and equipments were completed practically according to schedule but production process was delayed. Except a 33 per cent decrease in the production of salt as compared with the result obtained during the first year, productions rose in all branches of the Plan.

In the production of pig iron, steel materials, and steel ingots, an increase was registered respectively of 17 per

Digitized by Google

cent, 50 per cent, and 18 per cent as compared with the results obtained during the first year. This meant an attainment of the second-year goal to the extent of 99 per cent for pig iron, 112 per cent for steel materials, and 95 per cent for steel ingots. Moreover, a result beyond expectation had been obtained in the installation of furnaces and other equipments, mostly made in Manchoukuo. In the construction of hydro-electric power plants, all foundation works progressed according to, or even beyond, the schedule. In the production of coal, an increase of roughly 5 per cent was achieved over the first-year results, the Manchuria Coal Mining Company producing 300,000 tons and the S. M. R. collieries chalking up 800,000 tons. The chief difficulty felt was the shortage of labour and lumber supplies. The delay in the importation of equipments and materials have caused a considerable delay in the construction of coal-liquefaction plants. The production schedule of soda and ammonium sulphate progressed smoothly, but the production of pulp did not measure up to the second-year goal due chiefly to the delay experienced in the utilization of forest resources in the Hsingan Ranges. In the field of gold, zinc, lead, copper, aluminum, and magnesium industries, concentrated efforts were still being directed in completing preparations for increased or initial productions and, naturally, the actual production was 24 per cent short of the expected goal. The salt industry lagged and the production reached only about 40 per cent of the goal on account of the excess of rainfalls.

The agricultural plans received an unexpected setback on account of damages caused by cold and flood. Besides, the programme of establishing Agricultural Cooperative Associations did not progress according to schedule and their participation in the programme of increased production was sadly delayed. Yet, the programme of opening up new farms progressed steadily and the general results as shown by the third crop estimate for 1938 was fairly satisfactory. The productions of soya beans, maize, rice, and tobacco exceeded the expected results; of some 182,000 hectares of the area under cotton, only some 156,000 hectares matured due to the unreasonable cold weather but the actual yield was comparatively good; the wheat, kenafe, and lucerne crops did not measure up to the required goal due to abundance of rain, while the flax and wild silk productions were on the whole satisfactory.

In the live-stock industry, accurate figures are too early to be had but the actual increase was reported to be on the whole up to the estimated figure. Comparatively good results were secured in the improvement of the quality of pork, beef, skins, and wool, while the results obtained in the case of sheep, horses, and cattle were nothing outstanding. Thus, the question of improving the entire field of live-stock industry, will bear analysis in the third year of the plan.

In the construction of railways, highways, and harbours, the results exceeding expectations were registered. The development of communications in particular has shown phenomenal development.

The outbreak of the China Incident has unavoidably impeded the set programmes for Japanese immigration into Manchuria and the actual number entering the country fell short of 25,000 households, which is the combined quota for the first two years. This shortage was amply made up, however, by the arrival in Manchuria of the newly inaugurated youth volunteer settlers, of whom 17,429 entered various training camps in Manchoukuo during the year. These youths, after two-year training, will join various types of Japanese settlements. Moreover, the Japanese colonists had a net income of about ¥800 on the average from each cho of land (.991 hectares or 2.46 acres) after deducting living expenses, repaying borrowed capital, and meeting miscellaneous expenditures, the yield from each cho of land being between ¥1,800 and ¥2,000.

Of the estimated fund of 850 million yuan needed for the second year of the plan, about 80 per cent had been actually secured. This included the yen-funds of 460 million yen, comprising 150 million yen from Japanese bond fiotations, and 310 million yen raised by special corporations in Manchuria. With the exception of the Manchuria Coal Mining Company, the other special corporations on the whole succeeded in raising their needed funds without much difficulty. Due to the dismal international situation and the lag in exports the expected amount of foreign capital could not be obtained.

The following table shows the percentage of progress made in the manufacturing fields during the second year in comparison with 1936, the year before the Five-Year Industrial Plan was inaugurated, and the goal of the second-year in 1938.

Digitized by Google

SECOND YEAR OF FIVE-YEAR INDUSTRIAL PLAN

Classifications	Percentage over 1936 Figures	Percentage over Second-year goal
Steel	117%	99%
Steel Materials	150	112
Electricity	126	100
Chemical Products	449	92
Semi-manufactured Goods	118	95
Coal	105	91
Liquid Fuel	100	100
Metals Other than Steel	150	76

It should be added here, however, that the first and second years constitute a period of preparation and the actual results of the Five-Year Industrial Plan will not be shown until the end of the fifth year after passing through another period of added preparations during the third and fourth years.

Manchuria Industrial Development Corporation

The birth of the Manchuria Industrial Development Corporation in December, 1937, may be regarded as one of the greatest events in the industrial history of Manchoukuo.

The seeds of this project were sown in the early autumn of 1936 when Mr. Aikawa, the President of the Nippon Industrial Company, made a tour of Manchoukuo at the invitation of the Hsinking authorities for the purpose of inspecting all phases of the region's industrial opportunities. Later, he was appointed an advisor to the Kwantung Army. The seeds thus sown gradually bore a fruit in the form of a huge enterprise to harness and to make available the far-flung rich resources of Manchoukuo under one integrated and coordinated programme. Once this procedure had been decided upon, the negotiations proceeded smoothly and rapidly and the first announcement by the Japanese and Manchoukuo Governments and by Mr. Aikawa of the proposed change in the status of the Nippon Industrial Company and the formation of the Manchuria Industrial Development Corporation was made on October 29, 1937. On the following November 20, a general meeting of shareholders of the Nippon Industrial Company unanimously resolved to remove the Company's Head Office to the S.M.R. Zone in Hsinking; on December 1, the nationality of the Nippon Industrial Company was changed from Japanese to Manchoukuoan as a result of Japan's relinquishment of her extraterritorial rights in Manchoukuo and the transfer of her administrative rights over the S.M.R. Zone; on December 20, the Manchuria Industrial Development Corporation Administration Act was promulgated by the Manchoukuo Government; on December 27, a general meeting of shareholders of the Nippon Industrial Company unanimously passed the necessary resolutions for changing the Company into the Manchuria Industrial Development Corporation, and all the officers of the old Company resigned from office and new officers were elected; and on March 1, 1938, the new Corporation began its multifarious career officially.

The Manchuria Industrial Development Corporation is a semi-governmental corporation established under the Manchuria Industrial Development Corporation Administration Act which was promulgated on December 20, 1937. It was organized with its headquarters at Hsinking as a result of a merger of interests between the Manchoukuo Government and the Nippon Industrial Company. Thus, of its authorized capital of 450,000,000 yuan of which 396,750,000 yuan are paid up, one-half is furnished by the Manchoukuo Government and one-half by private interests which in fact are the shareholders of the Nippon Industrial Company which operates 18 huge subsidiary enterprises and 130 attendant projects with a combined authorized capital of ¥900,000,000 in Japan. Its object is defined in the Administration Act as expediting the coordinated establishment of heavy industries and controlling those industries. For this purpose the Corporation is authorized "to invest in any or all of the following industries and to direct the management thereof in this country: (1) iron and steel industry; (2) light metal industry; (3) automobile manufacturing industry; (4) aeroplane manufacturing industry; and (5) coal industry." It is authorized also that the Corporation "may invest in the business of mining gold, zinc, lead, copper, and other metals or other enterprises" by obtaining governmental permission for businesses other than the mining.

In order to safeguard the interests of shareholders and to provide for investment of private capital in Manchoukuo, the details of financing have been carefully worked out and defined by the Administrations Act as follows: (1) that the dividend, when the amount is not in excess of 7½ per cent, shall

Digitized by Google

be distributed in the proportion of one part to the Government and two parts to the private shareholders, and, when the amount exceeds 7½ per cent, such excess shall be distributed in equal proportion to both (Article 12); (2) that the Government shall guarantee the principal and consolidated net returns of 6 per cent per annum for ten years from the founding of the Corporation and, when the net profits at the end of each fiscal year are less than 6 per cent, it shall make up the deficit up to 6 per cent, it being understood that it shall be reimbursed in subsequent periods out of any earning in excess of 6 per cent (Article 13); (3) that, in case of the dissolving of the Corporation, the residual assets shall be divided between the Government and the private shareholders, in the ratio of one to two up to 150 per cent of the amount of the paid-in capital and equally in excess thereof (Article 14); and (4) that, when the capital is increased, special provisions shall be made for the distribution of dividends as well as the distribution of residual assets (Articles 12 and 14). In addition, according to a statement issued to the shareholders of the Nippon Industrial Company, the agreed terms include the following: that no Manchoukuo tax shall be imposed on profit made by the Corporation from investments outside of Manchoukuo and on dividends paid by the Corporation to shareholders residing outside of Manchoukuo; that the Manchoukuo Government shall take suitable steps in regard to the taxation of enterprises in Manchoukuo so that the function of integrated management of the Corporation will not be impaired when a change in the taxation system should cause an additional burden to be placed upon it in the future; that the Corporation shall not be restricted in fixing the dividend rate when a disposal of profits is made; and that the Japanese and Manchoukuo Governments shall take suitable measures with regard to the transfer of private shares so that the existing negotiability shall not be impaired. The Corporation is empowered to issue debentures up to twice the amount of the paid-in capital with the sanction of the Government. The Corporation is to have one President and two Vice-Presidents, to be appointed by the Manchoukuo Government, and five or more Directors and three or more Auditors, to be elected at general meetings of shareholders. Mr. Yoshisuke Aikawa, the former President of the Nippon Industrial Company, was appointed the first President of the new Corporation.

The work of the Corporation thus organized during the first year concerned on the whole in lining up its future activities. Under its general control have come among others, 9 companies in Manchuria and 13 companies in Japan as its principal subsidiaries. Those companies in Manchuria are the Showa Steel Works producing pig iron and steel products, the Penhsihu Coal and Iron Works producing pig iron and steel, the Manchuria Aluminum Manufacturing Company manufacturing aluminum, the Dowa Automobile Company producing passenger cars and trucks, the Manchuria Mining Company mining gold and other metals, the Manchuria Coal Mining Company engaged in coal mining, the Manchuria Gold Mining Company engaged in gold dredging, the Manchuria Lead Company producing lead and zinc, and the Manchuria Soya Bean Industry Company producing soya bean flour and oil. Of these, the first 4 are semispecial corporations, the next 3 are special corporations, and the last 2 are ordinary corporations. It has since organized the Manchuria Aircraft Manufacturing Company for the production of airplanes and the Tungpientao Development Company for the development of the Tungpientao region. The 13 companies in Japan were the subsidiaries of the Nippon Industrial Company before its merger.

General Industrial Expansion

The period under review has witnessed a continued expansion in all phases of industrial activities and new firms were established in increasing numbers. In this respect, Manchoukuo continues to be a veritable industrial boom land.

Between 1932 and 1935, the Manchoukuo Government has caused the establishment of 12 special and 6 semi-special corporations, the combined authorized capital of the former at the end of 1938 totalling 336,300,000 yuan and of the latter, 385,990,000 yuan. To these were added 17 special and 6 semi-special corporations during 1936-1938 as the following table shows:

Digitized by Google

SPECIAL AND SEMI-SPECIAL CORPORATIONS, 1932-1938

(In 1,000 Yuan)

Years	Special Corporations Number	Authorized Capital	Paid-up Capital	Semi-Special Corporations Number	Authorized Capital	Paid-up Capital
1932-35	12	336,300	234,000	6	385,990	258,490
1936	6	104,000	73,350	2	18,000	12,000
1937	6	607,000	518,850	2	6,000	3,100
1938	5	110,000	37,500	2	33,000	13,200
Total	29	1,157,300	863,700	12	442,990	286,790

Of the special corporations established during 1936-1938, the most important were the Manchuria Industrial Development Corporation, the Industrial Bank of Manchou, the Manchuria Colonial Development Company, the Manchuria Aluminum Manufacturing Company, the Manchuria Mixed Fuel Company (authorized capital 50,000,000 yuan, paid-up capital 10,000,000 yuan), and the Manchuria Yalu River Hydro-Electric Power Company (authorized capital 50,000,000 yuan, paid-up capital 25,000,000 yuan) which is the Manchoukuo portion of the gigantic Yalu River hydro-electric power project.

The companies and firms of all kinds which were established after the founding of Manchoukuo were as follows according to the reports of the Central Bank of Manchou:

During the year 1938, according to the same source, 625 new firms with a total combined authorized capital of 134,500,752 yuan were established, while 82 firms increased their authorized capital by 23,049,425 yuan, 75 firms increased their paid-up capital by 150,428,500 yuan, 3 firms decreased their capital by 212,500 yuan, and 107 firms with a total combined capital of 20,896,200 yuan were

Digitized by Google

dissolved, the total addition to the number of firms during the year being 518, and the total increase in authorized capital being 136,441,447 yuan. At the end of 1938, moreover, the total number of companies, according to the same source, jumped to 3,888, with a total combined authorized capital of 3,362,523,000 yuan and a total combined paid-up capital of 2,478,805,000 yuan. The details are as follows:

New Industrial Center of Mukden

Parallel with the construction of Hsinking as the political capital of the new State, the city of Mukden is witnessing a marvellous transportation of its western section into a new industrial centre. Just as in the case of Hsinking, what was before 1931 nothing but a rolling stretch of grassy fields and scattered farms has now become a veritable bee-hive of industrial plants, public buildings, and private residences. The Tiehsi, as this section of Mukden west of the railway is called, is destined to become the industrial capital of Manchoukuo.

Long before 1931, the South Manchuria Railway Company, with its usual foresight, planned to establish a new industrial centre in Mukden and repeatedly negotiated with the Chang regime for the purchase of a large tract of land to the west of the railway. All negotiations failed. Then came the Manchurian Incident and the eventual establishment of Manchoukuo. After the emergence of the new State, the eventual construction of an industrial empire was proclaimed by the publication on March 1, 1933, of the "General Outline of Economic Construction Programme of Manchoukuo." In this detailed document, the Government proposed, among other things, to establish industrial districts in Mukden, Antung, Harbin, and Kirin for the purpose of stimulating a "healthy development of industries" and securing the "benefits of concentrated establishments." It was in realization of this vision that the phenomenal development of industrial districts followed, especially at Harbin and more notably at Mukden.

With such a background, an auspicious start in the development of the Tiehsi section of Mukden was made in March, 1935, with the establishment of the Mukden Industrial Land Company. This Company was established with an authorized capital of 3,500,000 yuan, all paid up (increased to 5,500,000 yuan in July, 1935), jointly furnished by the Manchoukuo Government and the South Manchuria Railway Company, for the purpose of constructing and managing the industrial sites and accompanying facilities, including city streets and public utilities. Two years later, in 1937, in view of the impending abolition of Japan's extraterritorial rights in Manchoukuo, the South Manchuria Railway Company sold off its shares in the Mukden Industrial Land Company to the Manchoukuo Government and the management of the entire project was completely entrusted to the City of Mukden. The land involved in this gigantic industrial project now totals some 4,500,000 tsubo or 14,215,000 square metres, approximately 5 square miles.

Within a short span of slightly over three years since the inauguration of the project, the human efforts have transformed the Tiehsi area into a great industrial town. The marvellous speed with which the Tiehsi had been built up may be seen from the fact that, on January 31, 1939, there were already 107 factories in operation, 36 factories

Digitized by Google

under construction, and 48 factories still untouched, representing a total capital of almost 300,000,000 yuan. The following table gives the distribution of various industries on the Tiehsi map as of January 31, 1939:

NUMBER OF FACTORIES IN TIEHSI, MUKDEN

Industries	In Operation	Under Construction	Being Projected	Total
Textile	5	2	3	10
Metal	30	7	9	46
Machinery, Tools	15	6	12	33
Chemical	10	12	12	34
Food-stuff	15	1	1	17
Ceramic	5	3	2	10
Lumber, Wood Works	8	0	3	11
Miscellaneous	19	5	6	30
Total	107	36	48	191

Although the Tiehsi is easily reached from the centre of Mukden, a new city is also growing around the rapidly multiplying factories. For the project includes, not only the building of an industrial district, but also the accommodation of all necessary facilities such as residences, stores, governmental buildings, schools, and even parks and other recreation centers. Thus, by the close of 1938, there were already some 13,000 households embracing 63,000 inhabitants and roughly 80,000 people in employment within the district. Within a few years, an all-inclusive industrial town with a population of at least quarter of a million and annual production exceeding 100 million yuan is expected to rise.

Japan's Investments in Manchoukuo Japan's investments in Manchoukuo were estimated to have amounted to about ¥2,928,716,000 at the end of August, 1936. The figure does not include those before the Manchurian Incident, such as those in limited and unlimited partnership companies, private companies and others. If the pre-Incident figure is added, the actual investments in Manchuria are believed to total at least ¥3,400,000,000 or so. The fact also must not be overlooked that, in addition, the Manchurian Incident expenditures paid by the Japanese Government for six years, 1931-36, amounted to ¥1,067,528,000. The combined total of Japan's "investments" thus makes the aggregate sum of ¥4,467,528,000.. This enormous amount of money is penetrating into that State and is forming sources of economic boom of Manchoukuo.

Of Japan's total investments, about ¥1,700,000,000 was invested before the outbreak of the Incident. According to the South Manchuria Railway Company, the pre-Incident investments were distributed as follows : 30 per cent in transportation ; 11.6 per cent in finance ; 6.7 per cent in commerce ; 16.2 per cent in agriculture, forestry and mining ; 9.2 per cent in industry ; and 26.3 per cent in other enterprises. It is further classified that out of the ¥1,700,000,000 investments, ¥837,000,000 took the form of investments in securities and the remaining ¥863,000,000 in limited and unlimited partnership companies and private companies.

Investments in securities before the Incident consisted of those in debentures and stocks and loans, which may be partially regarded as investments in securities. At the end of 1931, the total investments of Japan in securities relating to Manchuria amounted to ¥837,536,000, of which ¥710,906,000 was connected with the S.M.R.Co. The fact shows Japan's investments in Manchuria before the Incident were almost exclusively limited to the railway company. Details are:

To this huge total were added new investments amounting to some ¥788,-381,000 during 1932-35 or first four years of the new State, making the total investments up to 1935 around ¥2,405,347,000. During the period under review, according to the reports of the Manchurian Affairs Bureau, ¥262,995,000 were added in 1936, ¥341,272,000 in 1937, and ¥430,981,000 in 1938, or a total of ¥1,035,-248,000. The grand total of Japanese investments in Manchuria at the end of 1938 is thus estimated to be around ¥3,440,595,000.

The details of Japanese investments in Manchuria during 1936-1938, as announced by the Manchurian Affairs Bureau in Tokyo, are as follows:

JAPANESE INVESTMENTS IN MANCHURIA, 1936-1938

(In 1,000 Yen)

Specifications	1936	1937	1938
S. M. S. Share Payments	36,000	56,000	20,000
S. M. R. Debenture Increase	154,775	21,000	115,000
S. M. R. Borrowings	75,550	84,000	89,000
S. M. R. Subsidiary Shares Sold	17,205	—	1,344
Net Increase in Debentures and Borrowings of Leading Companies in Manchuria	31,750	20,050	28,700
Paid-Up Capital of New Companies	36,046	34,144	91 613
Paid-Up Capital of Old Companies	23,394	50,719	42,285
Manchoukuo Loans	2,000	2,000	2,000
Manchoukuo National Bonds	4,000	6,000	8,000
Manchoukuo Borrowings for N. M. R.	15,400	38,360	38,360
Manchoukuo N. M. R. Bonds	60,000	—	50,000
Manchoukuo Investment Bonds	—	—	600
Manchoukuo Special Enterprises Bonds	—	—	100,000
Manchuria Industrial Bank Bonds	—	45,000	—
Total	262,995	341,272	430,981

Foreign Investments The foreign investments in Manchoukuo in 1933 amounted to ¥2,063,850,000 distributed among the various countries as follows, according to the statistics compiled by the South Manchuria Railway Company :

Country	Amount of Investments	%
Japan	¥1,510,755,000	73.201
Russia	465,051,000	22.531
Great Britain	39,590,000	1.918
United States	26,400,000	1.279
France	21,086,000	1.022
Sweden	850,000	0.041
Denmark	157,000	0.008
Total	2,063,880,000	100.000

According to the most reliable statistics, foreign investments in Manchoukuo before the Incident are roughly estimated at ¥2,400,000,000, of which those by Japan are approximately ¥1,700,000,000 ; those by the Soviet Union ¥590,000,000 ; those by Great Britain ¥40,000,000 ; those by the United States ¥30,000,000 ; and those by France ¥25,000,000.

Agriculture

General The vast plains of Manchuria consist for the most part of agricultural land, covered with fertile soil or humus, and agriculture has always been the main occupation of the people of Manchuria. The recent development of transport facilities has encouraged the coming of immigrants in large numbers from China, especially from Shantung province. Undeveloped land is being thus brought under cultivation, and every year sees some increase in the total amount of farming products. Unfortunately, these immigrants possess neither scientific knowledge nor capital, and, as they still follow primitive methods of cultivation, the productiveness of the land is not yet fully exploited. The wide plains that characterize the country invite the use of machinery for large-scale cultivation and if capital and technical skill were applied, their agricultural products could certainly be multiplied many times. One novel feature of the agriculture in Manchoukuo is that Korean farmers who migrated there are doing a large share of the work.

The plains along the lower Liao River, the upper and middle Sungari River, and the Hurka River are most fertile and constitute the main agricultural territory of Manchoukuo. Next come the lands in the centre or Lungkiang province and along the lower reaches of the Sungari. These districts have been developed with an astonishing rapidity by the Chinese immigrants from Shantung and Hopei.

Arable Land The area of arable land in Manchoukuo in 1935 follows :

AREA OF ARABLE LAND IN MANCHURIA

(Unit: hectare)

Provinces	Total Area	Arable Land
Kirin	11,276,777	4,618,860
Lungkiang	16,042,130	8,223,280
Heiho	2,858,260	873,180
Sankiang	9,685,380	4,090,750
Pinkiang	16,882,840	6,347,340
Chientao	4,629,220	1,853,780
Antung	8,160,250	425,000
Fentien	7,068,350	3,252,560
Chinchow	2,290,330	795,090
Jehol	13,606,060	1,217,930
Total	92,499,590	31,697,870

Digitized by Google

In round figures, 70% of the total crops constitute items of private and domestic consumption while the remaining 30% represent the exportable commercial goods. Soya beans constitute the dominant produce intended for export, 80% of which is marketed abroad. At any rate, agriculture in Manchuria can distinctly be labelled as private and individualistic. In the following sections, such items as area of cultivated land, produce in amount, and the conditions of commercialization will be briefly treated.

Agricultural Products and the Area of Cultivated Land As it is commonly known, the primary crops of Manchuria are soya beans, kaoliang, millet, corn, and wheat. The total land area used for the raising of these products is 80%. The remaining crops are paddy rice, upland rice, beans, green peas, buck wheat, cane, barnyard grass, rye, and barley, which are raised throughout Manchuria, while cotton, tobacco, hemp, flax, perilla, gingelly, etc., are widely raised. Together with cabbage, hop, fruits and lucerne, the entire agricultural products of Manchuria number some forty or fifty species.

Immigration of Japanese and Korean Farmers As a result of the Manchurian Incident the various obstacles brought to bear upon the Japanese, were effectively eradicated in 1931. The Japanese settlers were now entitled to hold land and to carry on commerce, and contrary to the previous situation, received much encouragement from the Manchoukuo Government, under whose efficient administration, peace, order and safety replaced the chaotic conditions prevalent in the past years. Consequently, the Overseas Ministry of the Japanese Government drew up definite plans in 1932 to promote the immigration of Japanese farmers into Manchuria seeking to send as many individuals or families that desired or were capable of cultivating farm lands.

Digitized by Google

Great care was taken by the above authorities to pursue a different immigration policy than that followed heretofore in sending contract labourers or employees destined for settlement in the Kwantung Leased Territory or the South Manchuria Railway Zone.

Thus, the Overseas Ministry decided to carry out its initial experimental immigration programme which called for the sending of approximately 2,800 families in five stages during the years beginning with 1932 and ending in 1936. The results of this programme were carefully studies from all angles.

Simultaneous with the above programme, others were carried out, some of them being private affairs. The main ones included the immigrants of the Tenrikyo Sect, Tenshoen, and the railway guard settlements sponsored by the South Manchuria Railway's General Directorate of Railways.

The experimental immigration projects were generally successful. On the one hand, the Government of Manchoukuo passed a law to protect and aid Japanese agricultural immigrants coming into the country. In 1935, the Manchuria Immigration Association was formed, and carried on advertisements, recruiting of prospective immigrants, and looked after preliminary training of the recruits. Then in the earlier part of 1936, the Manchuria Colonization Joint-stock Company capitalized at ¥15,000,000, was formally inaugurated, and authorized to handle immigration affairs in behalf of settlers such as negotiation for land leases, jurisdiction and distribution of land, to create establishments and institutions for immigrants, and to handle financial matters. Finally, in July of the same year, the Overseas Ministry in Tokyo adopted concrete plans to send a total of 1,000,000 families (5,000,000 persons) to Manchuria over a period of twenty years, as a result of careful deliberation in the Japanese Cabinet supported mainly by the success of the Fifth Experimental Immigration. Some 50,000 Japanese have already migrated to Manchoukuo.

In conformity with the mass immigration plan, the Manchuria-Korea Colonization Company, which took over the Korean immigrant farmers' encouragement work in the new State, conducted formerly by the Toa Kangyo Company, upon its establishment towards the end of 1936, has purchased suitable lands in various parts of the country for the settlement of Korean farmers, and is making every effort to stabilize their livelihood. For this purpose, it is establishing various facilities necessary for their settlement, is advancing loans to them to engage in independent farming, and is planning to transfer the ownership of farms to the settlers on an annual instalment payment plan.

The Company's business record for the past year is as follows:

	No. of households	No. of persons
Settlement of new immigrants	2,800	14,200
Settlement of those who had already migrated	330	1,650
Total	3,130	15,850

	Increase over 1937 (In chobu)
Paddy fields under cultivation	16,150	3,390
Lands cultivated with other crops	30,050	15,750
Loans advanced	M¥11,046,082	

The Manchuria-Korea Colonization Company plans to settle 10,000 Korean households in Manchoukuo in 1939.

Live Stock Raising of domestic animals is indispensable to Manchoukuo's agricultural system, as they serve well for the daily life of the farmer as well as for transport purpose. They are widely spread and almost every family raises some kind of them. Farm wastes are utilized for feeding them, while their excrements are used as fertilizer, and ploughing, stamping, harrowing, manuring, transporting and threshing, etc. are carried out with their help. The number and principal kinds of live stock were as follows in September, 1937:

Cattle	1,683,259
Sheep	1,965,994
Goats	1,243,105
Pigs	5,335,723
Camels	12,738

Wools and Hides Sheep are raised for the purpose of getting meat, but not for wool. Wool obtained from them is very coarse. It is not good for woollen cloth making, and is therefore used only as carpet wool. The amount of wool produced is estimated at 9,000,000 lbs. a year.

As meat is of universal demand in Manchoukuo, the number of live stock slaughtered every year is very large. Owing to the lack of accurate statistics,

Digitized by Google

the number actually slaughtered is not known, but the production of hides is estimated at 450,000 from cattle, 2,000,000 from sheep, and 380,000 from mules and donkeys. But there is no tannery which is equipped with modern machinery to put a good finish to the hides, though a large number of hides is exported every year.

Forestry

General The total forest area in Manchoukuo is estimated at 358,684 sq. km. which is equal to about 36 per cent of the entire area of the country. Some 350 species of timber are found in the forest regions located in the Yalu Valley, Tumen Valley, Mutan Valley, Lalin Valley, Sanhsing District, Great Hsingan Range and Small Hsingan Range. The volume of standing timber is estimated at 15,000,000,000 koku. Investigation conducted by the Manchoukuo Government, however, shows that the deforestation seems to have been done in a reckless manner in the past and the real volume of the standing timber may perhaps be about 9,000,000,000 koku.

STANDING TIMBER IN MANCHOUKUO

Districts	Estimated Standing Timber in 1,000 koku	Principal Species of Timber
Right bank of the Yalu and the Hunho valley	276,635	Korean pine, Korean fir, Korean larch, silver-fir, maple, birch, oak, ash, doronoki.
Sungari valley	874,036	
Tumen valley	420,401	Korean pine, fir, spruce, larch, lime,
Hurka valley	420,951	oak, elm, ash, birch.
Lalin valley	300,490	
North Manchuria Railway eastern line district	898,296	Korean pine, fir, spruce, maple, birch, doronoki, Siberian cork-tree, Manchurian walnut.
Sansing district	2,615,302	Korean pine, fir, spruce, Siberian cork-tree, ash, birch, oak, lime.
Great Khingan range	5,600,000	Larch, Japanese birch, Siberian red
Little Khingan „	3,500,000	pine, willow, alder.
Total	14,906,111	

For the purpose of preserving forests and securing their rational management, the authorities of the new régime have stopped granting fresh forest concessions and have commenced to classify forests into three categories, viz., State, public, and private, under a three-year programme. At the outset the authorities took over the various forests of the Central Bank in Kirin province as State forests, for which purpose a sum of M¥2,000,000 was appropriated in the 1933 supplementary budget. The forestry offices established in 1933 at Chiacho, Tunhua, Yenki, Wuchang and Peianchen and the branch office at Hailar, have been entrusted with the rational management of State forests and the improvment of forestry. Some 15 other forestry offices were also established in various other districts during 1934-35.

Under the slogans, "Arouse the Love for Forests," "Build Up the Health of the Citizens," "Beautify the Suburbs," and "Plant Forests for Protection Against Winds," Hsinking observed Arbor Week from April 16 to 22, 1939, by planting 400,000 saplings in various parts of the capital and along the Kirin Highway for a distance of 10 kilometres. One hundred thousand officials, citizens and students were mobilized for this task. On the last day, an impressive ceremony marking the completion of Arbor Week was held at Tatung Park, where saplings were distributed to all attending the function. Other cities throughout Manchuria also observed Arbor Week by planting thousands of young trees.

This year is the last year of the first stage of the 30-year reforestation and afforestation programme, upon the completion of which 845,000 hectares will be afforested, 812,000 hectares will be reforested, 3,065,000 hectares of nurseries will be established, and 7,960,000 hectares of forests will be preserved. Divided into four periods, the programme is as follows:

Digitized by Google

Unit: 1,000 hectares

	1-5	6-11	11-20	21-20	Total
Afforestation	95	150	300	300	844
Reforestation	65	150	300	295	812
Nurseries	155	510	1,200	1,200	3,065
Preservation	215	925	3,800	3,020	7,960

In 1939, 5,000 hectares will be planted with trees.

The forestation programme will entail an expenditure of M¥7,901,803 during the next five years, including this year.

Year	Yuan
1939	1,208,874
1940	1,346,787
1941	1,608,766
1942	1,819,426
1943	1,917,950
Total	7,901,803

Species of Timber In Manchuria there are as many as 350 species of timber, but the more common species are the following:

Evergreen: Korean pine, silver fir, Korean fir, spruce, larch.

Deciduous: Korean oaks, birch, Amur lime tree, ash, elm, willow.

The proportion of evergreen to deciduous is 4 to 6, and in the evergreen the Korean pine constitutes more than half of the total.

Lumber Industry Lumber industry is carried on in the districts of Antung, Kirin and Harbin, but that in Antung districts is best known. Production of lumber in Manchoukuo in 1937 was 7,525,617 koku.

The Industry in Eastern Manchuria. There has been a boom recently in the timber industry due to bristling building activities in the principal cities and the construction of additional railways throughout the country. At the present there are thirteen large lumber-mills in this region working at full capacity. If timber sawn by coolies in a primitive method is taken into consideration, the annual amount of timber sawn in this region may even reach 1,500,000 koku (1 koku—10 cu. feet). The thirteen large lumber-mills capitalized at M¥12,600,000 produced 2,700,000 koku: 1,300,000 koku of sleepers and 1,400,000 koku of others in 1936.

Pulp Industry With abundant timber resources, Eastern Manchuria is also expected to occupy an important position in the pulp industry. Four companies, the East Manchuria Rayon Co. (Kaishantun), Manchuria Pulp Co. (Hualin), Oriental Pulp Co. (Shihhsien), Japan-Manchuria Pulp Co. (Tunhua), capitalized at M¥7,500,000, are planning to start operation in 1938. The demand for timber by these companies will amount to no less than 800,000 koku. The production of pulp in Manchoukuo in recent years was as follows:

	In metric tons
1933	17,361
1934	13,737
1935	13,718
1936	13,171
1937	15,011
1938 (estimate)	44,000

Fisheries

General In spite of the largeness of area, the coast line of Manchoukuo is comparatively short, its total length being only 855 kilometres. Moreover, the coast is made up of shallow bays, which readily get frozen in winter and are not therefore favourable for fisheries. But the industry is growing and, in 1937, the amount of catches reached 16,390,000 kan valued at ¥7,462,000.

Fresh Water Fishery Fresh water fishes are abundantly found in the Sungari, the Nonni, the Mutankiang, the Ussuri, the Amur and the Liao Rivers as well as Lake Hujunti, Peierhih, etc. The amount of catches in 1932 follows:

CATCHES OF FRESH WATER FISHES

River or lake	Catches in kg.
Hulanpeierh	4,500,000
Sungari River	4,200,000
Mutanchiang	500,000
2nd Sungari River	1,500,000
Nunchiang	6,000,000
Ussuri River	2,000,000
Liao River	1,000,000
Yalu River	2,000,000
Heilungkiang River	2,000,000
Total	23,700,000

Salt Industry The coast line of Manchoukuo stretches only for 855 km. which is but one-eleventh of the entire border line of the country. However, the coast on the Yellow Sea and the Po-hai has very little rainfall and as the evaporation is very rapid and the air dry, the district is well adapted for salt manufacturing by evaporation. The total area of salt fields as at the end of 1934 was 15,400 chobu of which 8,300 chobu belong to Manchoukuo and 7,100 chobu to Kwantung Leased Territory. The production in 1934, though much reduced on account of the weather, totalled 700,000,000 kin of which the quantity produced by Manchoukuo amounted to 280,000,000 kin and that by Kwan-

Digitized by Google

tung Leased Territory to 420,000,000 kin. The salt field extension plan of Kwantung Leased Territory made a great progress. Production of salt in recent years was as follows:

Year	Area in hectare	Amount in metric ton
1936	22,594	891,178
1937	22,964	834,711
1938	23,026	688,821

Mining Industry

The first sign of interest in mining manifested by the Manchoukuo Government took the form of the Mining Law and regulations connected therewith, promulgated on August 1, 1935, which were put into force on September 1, the same year. The former mining regulations classified the legal minerals into three groups and contained different stipulations concerning the procedure for filing applications for mining permits for each class of minerals. They also specified different categories of taxation. Under the new Law, however, all these distinctions were abolished and a common procedure for the acquisition of mining privileges established, while forty different minerals, considered important from the standpoint of Manchoukuo's mining and industrial policy, have been designated as legal minerals.

The forty legalized minerals are gold ore, silver ore, platinum ore, copper ore, lead ore, zinc ore, tin ore, iron ore, antimony ore, aluminium ore, nickel ore, cobalt ore, iron sulphate ore, chromite ore, mercury ore, arsenic ore, phosphorous ore, sulphur, graphite, coal, petroleum (including combustible natural gas closely related to oil-bearing strata), asphalt, oil shale, limestone, dolomite, magnesite, fluorspar, felspar, fire clay, barite, saltpetre, gypsum, silica, talc, asbestos and mica.

Special mining corporations are: the Manchuria Gold Mining Company which was established in May, 1934, following the discovery of prospective gold fields in North Manchuria, capitalized at 12,000,000 yuan (one fourth paid-up), of which 5,000,0000 yuan each is invested by the Manchoukuo Government and the South Manchuria Railway Company, and 2,000,000 yuan by the Oriental Development Company, the corporation, with its head office in Hsinking, has a monopoly of gold mining in the former provinces of Kirin and Heilungkiang; the Manchuria Coal Mining Company was incorporated in May, 1934, with a capitalization of 16,000,000 yuan, subscribed jointly by the Manchoukuo Government (8,000,000 yuan in kind) and the South Manchuria Railway Company (5,000,000 yuan in kind and 3,000,000 yuan in cash). Necessitated by the expansion of its enterprise resulting from the enforcement of its five-year plan of increased production, aiming at 10,000,000 tons annual output, the capitalization was raised to 80,000,000 yuan in April, 1937, the 64,000,000 yuan increase being borne equally by the Government and the S. M. R. Its head office is located in Hsinking. The Manchuria Petroleum Company was established in February, 1934, as a Manchoukuo juridical person, for the purpose of exploiting the oil resources of the country and of regulating the domestic demand and supply of petroleum, its initial capital of 5,000,000 yuan, of which 2,000,000 yuan was invested by the South Manchuria Railway Company, 1,000,000 yuan by the Manchoukuo Government, and 500,000 yuan each by the Nippon Oil, Ogura Oil and the Mitsui and Mitsubishi interests, was recently raised to 10,000,000 yuan. Of the 5,000,000 yuan increase, 2,500,000 yuan was furnished by the Manchoukuo Government and the remaining 2,500,000 yuan equally by the Central Bank of Manchou, the Nippon Oil, Mitsui, Mitsubishi and S. M. R. companies. Abiding by the Manchoukuo Oil Monopoly Law, enforced in April, 1935, and conforming to the plan for placing petroleum products in Manchoukuo on a self-supporting and self-sufficing basis, the Company is engaged in the buying, selling and refining of oil, as well as the investigation and prospecting of oil resources in the country. It has a large plant at Kanseishi, across the bay from Dairen, where crude oil imported from foreign countries is refined and sold to the Manchoukuo Government, which has a monopoly of the sale of gasoline, kerosene, gas-oil, heavy oil, benzol, and fuel oil substitutes; and the Manchuria Mining Development Company was established by Imperial Ordinance No. 91, promulgated in August, 1935, which stipulated that the company will have exclusive right to mine the following twenty-three minerals: platinum ore, lead ore, zinc ore, tin ore, iron ore, antimony ore, aluminium ore, nickel ore, iron sulphate ore, manganese ore, scheelite ore, molybdenum ore, mercury ore, phosphorous ore, coal, petroleum, oil shale, magnesite, fluorspar, fire clay, saltpetre, talc and asbestos. Its total capitalization is 5,000,000 yuan, subscribed equally by the Manchoukuo Government (1,000,000 yuan in kind and 1,500,000

Digitized by Google

yuan in cash) and the South Manchuria Railway Company (200,000 yuan in kind and 2,300,000 yuan in cash).

Gold Gold has been mined in Manchuria, especially in North Manchuria, from ancient times as there are historical facts showing that gold miners in the Moho district at one time established a republic of their own in opposition to the Chinese Government which held sway over the region. Records of that time show that as much as 500 poods of the precious metal (present value 19,000,000 yuan) were mined in the Moho district alone in three years.

The Moho district was later reverted to Chinese control through the dexterous policy of Li Hung-chang, Senior Grand Secretary of State, and the exploitation of its gold resources was conducted as a government enterprise, but no appreciable progress was witnessed owing to inefficient supervision and management.

In contrast to the slow progress of the gold mining industry in Manchuria prior to the advent of the new State, due to the employment of primitive mining methods by private interests, marked development is expected in the future, considering the rapid pace at which the industry has advanced within the short span of five years since the inception of Manchoukuo.

Iron The greater part of the iron deposits in Manchuria is found in South Manchuria. The ores are generally hematite and contain from 34 to 70 per cent of iron. The bulk of the deposits analyse between 35 to 40 per cent.

By the terms of the Sino-Japanese Treaty of May, 1915, the Japanese were allowed to take up mining activities in South Manchuria, and the Anshan Iron Ore Development Company was incorporated in March, 1916, under Japanese-Manchurian joint investment, for the purpose of mining the Anshan deposits and supplying them to the Anshan Iron Works, which was simultaneously established by the S. M. R. Company.

For several years the Anshan Iron Works experienced much difficulty owing to the high cost of production, due to the low content of iron in the Anshan deposits. To remedy the situation, a special concentration process for utilizing profitably the lean Anshan ores, invented after a series of painstaking research, was employed from 1926 with satisfactory results, but difficulties in management and finance were still unavoidable.

The outlook, however, became optimistic with the boom created in the heavy industries following the Manchurian Incident, and in 1933 the Showa Steel Works was established as an independent corporation with a ¥100,000,000 capital to take over the entire enterprise of the Anshan Iron Works.

Following its establishment, the Showa Steel Works purchased the rich iron mine at Kungchangling and built a railway line to transport ores from that mine to Anshan. The iron deposits at Kungchangling are estimated at about 380,000,000 tons.

In November, 1935, the Sumitomo corporation of Japan completed at Anshan, a well-equipped factory for producing iron pipes and fittings, with an annual output of 25,000 tons. The products are partly marketed in Manchuria and partly exported.

The iron works at Penhsihu are built on a smaller scale. Records show that the Penhsihu iron mine was worked by the Manchurians in a primitive way as early as 1833. Just before the outbreak of the Russo-Japanese War, the Russians had plans on foot for its exploitation, which were, however, frustratd by later events.

In 1914, the Penhsihu Colliery and Iron Works was established as a joint Japanese-Chinese enterprise, but owing to inefficient and complicated management, the company encountered much difficulty, especially after the World War. Following the Manchurian Incident, an extensive reorganization was effected and with the rapid progress of heavy industries during the past few years, the enterprise has been attaining noticeable improvement.

The leading market for Manchurian pig iron is Japan, which imports nearly 75 per cent of the total exported from the country.

Coal Coal is the most important mineral of Manchuria. According to an estimate made by the S. M. R. Geological Institute at the end of 1929, the total deposits in the country amounted to 4,800,000,000 tons. With the restoration of peace and order since the birth of the new State, an extensive survey has been made, and in consequence, a number of new mines have been discovered and opened so that to-day, the deposits are estimated at 10,000,000,000 tons at least. Many rich coal fields are expected to be found as further surveys are made in future, raising the aggregate deposits still higher.

Magnesite Manchuria is endowed with an abundant supply of magnesite, the total deposits being estimated at

Digitized by Google

several billion tons. In the districts around Tashihchiao, huge deposits of excellent magnesite, amounting to one billion tons, are found.

Magnesite mining in Manchuria is of a comparatively recent origin. It dates back to 1913 when native inhabitants brought an incombustible mineral resembling limestone to the South Manchuria Railway Company for chemical analysis. The mineral was found to be none other than magnesite, and the S. M. R., recognizing the need of magnesite as raw material for the future of Japan's light metallic industry, made every effort to acquire magnesite mining districts. Between 1915 and 1921, it managed to acquire thirteen such districts. Since 1921, it has purchased several other districts.

Oil Shale Oil shale covers the main coal seams of the Fushun coal fields to a thickness ranging from 70 to 120 metres. The deposits there are estimated at 5,400,000,000 tons, of which 200,000,000 tons will be dug out in the routine process of operating the open-cut coal mines, and thus this raw material is virtually obtained without involving extra cost. The oil content of Fushun shale varies from one to 14 per cent, averaging round six per cent.

Aluminium Shale In Manchuria, fire clay is found in layers between the strata of coal which belongs to the Permian carboniferous series. Fire clay having a high content of aluminium is used as raw material for the manufacture of aluminium and was discovered by Mr. Murakami, former director of the S. M. R. Geological Institute. He named it aluminium shale.

To commercialize the manufacture of aluminium from aluminium shale, the Japan-Manchoukuo Light Metal Manufacturing Company has been incorporated with a 25,000,000 yuan capital. Its plant, now under construction at Fushun, is expected to commence operations in the near future.

The Yentai fire clay deposits are exploited by the Showa Steel Works, but the production there does not amount to much.

Petroleum Since Japan is sorely in need of mineral oil resources, she conducted investigations in Manchuria following the Russo-Japanese War, but it was generally concluded by geologists that there was no oil in the country.

Before the Manchurian Incident, the South Manchuria Railway Company, hearing that oil was found to some extent in the district near Chalainoerh and another locality on the former North Manchuria Railway, took every pain to locate the reported oil fields, but came to the conclusion that the Chalainoerh district alone was worth further surveying.

After the Manchurian Incident the diamond drilling system was employed in the Chalainoerh district, with no appreciable results. Since the establishment of the Manchuria Petroleum Company, the oil boring method has been used, but so far no oil has been struck.

Steatite Steatite is found in large quantities near Taling, Tashihchiao and Haicheng. Its output is steadily mounting, due to increasing demand in Japan resulting from the rapid expansion of the paper manufacturing and spinning industries there. The Taling Steatite Company was established by the Northeastern Mining Bureau prior to the Manchurian Incident, and it soon came to take a controlling hand over the steatite mining industry.

Following the birth of Manchoukuo, the Minister of Industry, with the view to unifying the steatite industry in the country, caused the establishment of the Manchuria Steatite Company, with which was merged all the small mining companies, and entrusted this new concern with the exploitation of the rich Taling steatite deposits. Since then the industry has made marked progress.

Copper Well known copper mines in Manchuria are located at Malukow, in Chientao Province, and at Panling, on the Antung-Mukden line, but the operation of these is still discontinued at the present, due to the low price of copper. The reopening of these mines is highly desirable in view of the projected establishment of a copper refinery in Mukden and Japan's large importation of this mineral from abroad.

Lead In contrast to the scarcity of lead in Japan, Manchuria has large deposits of this mineral. The largest mine in operation at present is Yangchiachangtzu, near Chinchou, which is owned jointly by the S. M. R. and other Japanese interests.

Limestone Another abundant Manchurian mineral is limestone. The largest deposits are located at Choushuitzu, Huolienchai and Penhsihu. The Choushuitzu limestone is used extensively in cement and glass making at the factories located nearby. The output from Penhsihu nd Huolienchai is utilized at the iron works of Penhsihu and Anshan. The combined limestone output annually ranged from about 450,000 to 700,000 tons in recent years. Manchurian limestone is rarely found in pure form, but its total deposits are very

Digitized by Google

great.

Sulphuric Iron Sulphuric iron ore is found in many parts of the country, but so far no large mines have been discovered. At Linchiatai, near Tungyuanpu on the Mukden-Antung line, and at Yangmukou, there are sulphuric iron mines which are still being worked. The yield of these mines is supplied to the Sulphuric Acid Plant of the Fushun Colliery.

At the Penhsihu, Niuhsintai and Yentai coal fields, sulphuric iron ore is found in the coal seams, and is mined together with the coal.

Manganese Manganese is found at Heisunglin and at Hsiaohuangchi, where the deposits are of good quality but small, and are now being mined.

MINERAL OUTPUTS

(Unit: Metric Ton)

Products	1934	1935	1936
Iron Ore	1,133,371	1,477,940	1,795,287

Manufacturing Industries

General In spite of the abundant supplies of various raw materials and cheap labour, the industry in Manchoukuo is not yet in an advanced stage. This was particularly the case before the advent of Japanese into the country, owing to the undeveloped state of transport and the backward condition of most regions. At present industries have developd in the Kwantung Leased Territory and the South Manchuria Railway Zone. Aside from it the industry of modern type sprang up around Harbin. As a whole the industry in Manchoukuo is based on raw materials produced in the country which use them as material for products intended for exports as well as for the domestic consumption. Spinning industry is at present the only industry which uses raw materials imported from abroad. But except those in Kwantung Leased Territory most of the cotton spinning mills are of a class which are barely able to fulfil domestic demands.

Mills which employ more than 5 operatives in Manchoukuo number about 4,000 the products of which amount to more than ¥300,000,000 a year. Industries which yearly produce more than ¥10,000,000 are as follows :

Articles Produced	Amount Produced in yen
Bean cakes	72,000,000
Bean oil	32,000,000
Tobacco	29,000,000
Cotton yarns & fabrics	23,000,000
Wheat flour	23,000,000
Rolling stock	20,000,000
Cereals	19,000,000
Intoxicants	13,000,000
Pig iron	11,000,000

Oil Industry Making of soy bean oil and bean cake by pressing the soy beans early developed in Manchoukuo. With almost limitless supplies of soy beans, the industry advanced from mere handicraft work into the modern advanced industry as soon as the real worth of bean oil and bean cake was recognized. The bean oil and bean cake produced in this way constitute the most important items for export. The prosperity of Manchoukuo largely depends on this industry. In 1936 the total output of soy bean oil amounted to 65,940 metric tons and that of bean cake 654,500 metric tons.

Textile Industry Tusser silk is another export article next only to bean oil in importance. With the increased demand for pongees in Europe and America, the Japanese silk weavers in Fukui, Gifu and Kyoto prefectures began weaving them and the demand for this silk comes from these prefectures in Japan. The reeling is carried on by the Chinese farmers as a side line, and necessarily on the household basis. The production is largest in Antung. In 1932 it was M¥9,775,000, in 1933 M¥9,555,000 and in 1934 M¥7,408,000. About 70 per cent of the total export goes to Japan.

Of the total population of 30,000,000 in Manchoukuo, about 90 per cent wear cotton clothes. Therefore, from ancient times, there existed in Manchoukuo small, primitive plants for cotton weaving, but no large modern factories rose before the Great War. The establishment of the Cotton Spinning and Weaving Plant by Chinese at Mukden was followed by the establishment of

Digitized by Google

three companies by Japanese, viz.: the Manchurian Cotton Spinning Company, the Chinchou Factory of the Naigai Spinning Company, and the Manchuria Fufang Company. The total number of mills in 1932 was 83, the number of labourers 9,621, and the total production ¥17,401,310. The production of course cannot keep pace with the demand, and cotton cloth constitutes one of the principal imports for Manchoukuo, the amount reaching from ¥40,000,000 to ¥74,000,000.

Production of cotton yarns in 1937 amounted to 24,453,700 kg. and that of cotton textiles to 2,278,700 tan.

Flour Milling Flour milling industry is one of the three main industries of Manchoukuo. It is carried on either by the old-fashioned native mills or the modern mills run by machinery. Harbin is the centre of flour milling and has 40 mills, there being only 8 other mills in the southern part of Manchoukuo. The consumption in 1930 was only about 24,000,000 bags a year, which included both domestic and imported products. This increased in 1934 to 23,000,000 bags, exclusive of domestic product. If, therefore, the domestic product amounted in the year to 15,000,000 bags, the amount of consumption totalled 38,000,000 bags. Even this per capita consumption in Manchoukuo was a little over one bag, so that there is still a vast room left for further consumption. Import from Japan in 1934 amounted to 17,000,000 bags and about 6,000,000 bags were imported from Australia and America. The amount of its import is only second to that of cotton cloth in value.

Production of wheat flour in 1936 amounted to 337,447,700 kg. and in 1937 to 312,396,700 kg.

Foreign Trade

In parallel with the expansion of productive power brought about by world-wide rearmament, the trade policy of the Powers is aimed at closer economic relationship within their economic sphere of influence on the one hand, and, on the other, efforts for the development of international trade are being made not in accordance with free trade policy but within the sphere of controlled economy. Manchoukuo's foreign trade of 1937, too, moved in the direction of a closer Japan-Manchoukuo economic bloc on the basis of the Five-Year Industrial Development Plan. This tendency became stronger with the outbreak of the China Incident, and, with the strengthening of Manchoukuo's international position, her trade policy for the regulation and extension of foreign trade developed along the line of controlled trade. This policy of controlled trade took concrete forms upon revision of the Manchoukuo-Germany Trade Agreement in May, upon the establishment of the Otto Wolf Credit in September, and upon the revision and enforcement of Exchange Control Law in October.

With the expansion of the Five-Year Industrial Development Plan the Manchoukuo-Germany Trade Agreement which was extended for another three years and the Two Million Pound Otto Wolf Credit, gained in importance with the expansion of the Five-Year Plan. The revision of the Exchange Control Law and the Trade Control Law were aimed at the regulation of international balance of payment on the basis of Japan-Manchoukuo economic bloc in concert with the trade control policy of Japan, the former through the regulation of 'money' and the latter through the control of 'goods.' The economic relations between Japan and Manchoukuo made marked progress not only in the movement of capital but also in trade through these measures. The revised Customs Law at the end of December, 1937, further strengthened the inseparable economic tie of the two countries. Under a series of these measures the foreign trade of Manchoukuo achieved remarkable progress in 1937 and 1938. As it will be seen in the following figures, the total amount of trade in 1938 increased by 35 per cent to M¥2,000,202,050, the largest since the establishment of Manchoukuo.

(Amount in M¥1,000)

	Exports		Imports		Total		Excess of Imports
	Amount	Index Number	Amount	Index Number	Amount	Index Number	
1933	448,478	100.0	515,832	100.0	964,310	100.0	67,354
1934	448,427	99.9	593,562	115.1	1,041,989	108.1	145,135
1935	421,078	93.9	604,149	117.1	1,025,227	106.3	183,071
1936	602,759	134.4	691,830	134.1	1,294,589	134.3	89,130
1937	645,298	143.9	887,412	172.0	1,532,709	158.9	242,115

Digitized by Google

The causes of the remarkable increase in the value of trade were, the rise of commodity prices, especially those of imports; the increase of export value and the increase of volume of raw materials exported. The increase of import trade was due to the tremendous demand for construction materials as shown in the following table:

IMPORTATION OF HEAVY CONSTRUCTION MATRIALS

(Unit: 1,000 Yuan)

Goods	1933	1934	1935	1936	1937	1938
Iron and Steel Products	39,997	58,227	51,540	39,506	76,429	122,074
Machinery and Tools	9,544	28,056	33,510	38,918	65,901	121,501
Vehicles and Vessels	22,699	30,946	38,471	38,670	44,724	81,734
Electrical Appliances	8,115	14,484	18,778	21,683	34,014	39,767

According to Countries Japan's share of the foreign trade of Manchuria has been larger than that of any other nation for many years. This tendency has been strengthened further after the emergence of Manchoukuo and the creation of the Japan-Manchoukuo economic bloc. This result is natural when one takes into consideration various factors, especially the geographic propinquity and the phenomenal expansion in all phases of industrial activities in Japan.

During the period under review, the Manchoukuo trade with Japan kept on steadily increasing and far outdistanced other nations in its volume. It has grown from a total amount of 673,967,000 yuan in 1935 to 820,533,000 yuan in 1936, 987,781,000 yuan in 1937, and 1,410,238,000 yuan in 1938, respectively, from 65 per cent of the total trade of Manchuria in 1935, to 63 per cent in 1936, 64 per cent in 1937, and 71 per cent in 1938.

In studying these figures in terms of goods, a decidedly steady growth is noticeable in the importation of Japanese cotton, silk, and woollen goods into Manchuria. Especially noticeable has been the supremacy established by the Japanese cotton industry. Japan's strenuous but constant efforts to develop this industry have resulted in an amazing organization of all phases of this industry that its products can successfully compete with any Western products in almost any part of the world. In addition, Japan was favoured by her geographic position, enabling her to send her goods to the Manchurian market at much less freight expenses than the Western competitors. Thus, after the Great War, which crippled the cotton mills in Western countries and disturbed ocean transportation, Japan stood supreme in the Far Eastern market. But it should be remembered that the more Japanese cottton goods are exported to Manchuria or elsewhere, the greater will be the purchase of American and Indian raw cottons by Japan.

Next to Japan, China for years has occupied an important place in the Manchurian trade and the position second only to Japan has been consistently maintained. Since the Manchurian Incident, the Manchurian trade with China has declined for obvious reasons, from a total of 135,022,000 yuan in 1933 to 123,299,000 yuan in 1934 and to a low watermark of 97,346,000 yuan in 1935. It began to pick up again in 1936 when a total of 176,288,000 yuan was chalked up, followed by 153,077,000 yuan in 1937 and 192,398,000 yuan in 1938. It is an interesting fact that, in this decline and rise, the Manchurian export trade with China has been steadily on the increase. Thus, Manchurian exports to China rose from 55,210,000 yuan in 1933 to 65,694,000 yuan in 1934, 65,353,000 yuan in 1935, 128,603,000 yuan in 1936, 113,753,000 yuan in 1937, and 121,682,916 yuan in 1938. The imports from China have shown a slight gain during the period under review, from 31,993,000 yuan in 1935 to 47,685,000 yuan in 1936, 39,324,000 yuan in 1937, and 70,716,000 yuan in 1938.

If we turn to Western countries, the Manchurian trade with the United States has shown a most noticeable development in the recent years. The American trade with Manchuria totalled only 22,758,000 yuan in 1932 but it has jumped to 40,088,000 yuan in 1936, 76,197,000 yuan in 1937, and 104,430,000 yuan in 1938. The most remarkable fact about these figures has been the strong favourable balance which the United States has maintained steadily. Thus, the Manchurian imports from the United States have increased from 17,748,000 yuan in 1932 to 23,735,000 yuan in 1936, 57,523,000 yuan in 1937, and 93,070,000 yuan in 1938, more than a five-fold in-

Digitized by Google

crease, while the Manchurian exports to the United States have increased from 5,010,000 yuan in 1932 to only 16,353,000 yuan in 1936 and 18,674,000 yuan in 1937, dropping to 11,360,000 yuan in 1938, less than a two-fold increase between 1932 and 1938. These figures are most interesting in the face of the American attitude of non-recognition and her complaint against what she calls the "closed door" in Manchuria. On the other hand, the Manchurian trade with Germany has been about the same in value as that with the United States, but the Manchurian exports to Germany far outweighed the German exports to Manchuria. The Manchurian trade with Germany gradually dropped from 79,716,000 yuan in 1932 to 47,541,000 yuan by 1935 and began to regain the lost ground again since 1936, reaching 63,303,000 yuan in 1936, 76,330,000 yuan in 1937, and 87,700,000 yuan in 1938. Unlike the American trade, however, the bulk of the Manchurian trade with Germany was made up of exports. Thus, the Manchurian exports to Germany, which amounted to 73,946,000 yuan in 1932, dropped to 32,799,000 yuan in 1935 and began to rise again in 1936 with the conclusion of the new trade Agreement, rising to 50,278,000 yuan in that year and to 59,052,000 yuan in 1937, and dropping slightly to 50,396,000 yuan in 1938. The Manchurian imports have been increasing during the same period, increasing from 5,770,000 yuan in 1932 to 13,025,000 yuan in 1936 and 17,278,000 yuan in 1937 and jumping to 37,304,000 yuan in 1938.

The Manchurian trade with other Western countries has been almost negligible as the following two tables clearly indicate:

MANCHURIAN TRADE ACCORDING TO COUNTRIES

(Unit: 1,000 Yuan)

Countries	1936			1937			1938		
	Export	Import	Total	Export	Import	Total	Export	Import	Total

According to Commodities In the field of exports, the agricultural products continue to dominate all other products. Although Manchuria is rapidly becoming a bee-hive of industries, it is still primarily an agricultural country and the soya beans and their products, beancakes and bean-oil, have constituted more than half of its total exports for years. During the period under review, this condition has roughly persisted. The exports of soya beans and other beans, beancakes, and bean-oil totalled 214,611,000 yuan in 1935, increasing

Digitized by Google

steadily to 305,827,000 yuan in 1936, 328,297,000 yuan in 1937, and 334,224,000 yuan in 1938. In the total value of exports, these figures represented 50.9 per cent in 1935, 50.7 per cent in 1936, 50.6 per cent in 1937, and 46.1 per cent in 1938. Next to soya beans among agricultural products come millet, kaoliang, maize, groundnuts, and seeds. The export of millet has increased from 9,049,000 yuan in 1935 to 18,318,000 yuan in 1936, dropped slightly to 14,197,000 yuan in 1937, and again rose to 20,260,000 yuan in 1938, respectively, 2.1 per cent, 3.0 per cent, 2.2 per cent and 2.8 per cent of the total exports; that of kaoliang has increased from 3,993,000 yuan or 0.9 per cent of total exports in 1935 to 11,726,000 yuan or 1.9 per cent in 1936, 9,843,000 yuan or 1.5 per cent in 1937, and 18,846,000 yuan or 2.6 per cent in 1938; that of maize has increased from 1,470,000 yuan or 0.3 per cent of total exports in 1935 to 6,995,000 yuan or 1.2 per cent in 1936, 8,526,000 yuan or 1.3 per cent in 1937, and 18,328,000 yuan or 2.5 per cent in 1938; that of seeds, including perilla and castor seeds, has risen from 21,335,000 yuan or 5.1 per cent of total exports in 1935 to 22,936,000 yuan or 3.8 per cent in 1936, but dropped to 18,822,000 yuan or 2.9 per cent in 1937 and 17,868,000 yuan or 2.5 per cent in 1938. Next to agricultural products in importance is the coal which is gradually declining as an export item due to the increasing demand within Manchuria. Thus, the export value of coal has decreased from 40 million yuan or 9.6 per cent of total exports in 1935 to 35 million yuan or 5.8 per cent in 1936, 36 million yuan or 5.5 per cent in 1937, and 28 million yuan or 3.9 per cent in 1938. The export of sulphate of ammonium has increased from 6 million yuan in 1935 to 17 million yuan in 1938.

Among the commodities imported during the period under review, by far the largest group has been still the construction material. Thus, the imports of iron and steel, machinery and tools, vehicles and vessels, electrical equipments and appliances, timber and cement have first slightly dropped from 157,759,000 yuan or 26.1 per cent of total imports in 1935 to 151,897,000 yuan or 22.0 per cent in 1936 but again have risen to 224,347,000 yuan or 25.3 per cent in 1937 and 410,609,000 yuan or 32.2 per cent in 1938. Next in importance came the cotton piece goods which have increased from 60,340,000 yuan or 9.9 per cent in 1935 to 87,501,000 yuan or 12.6 per cent in 1936 and 104,645,000 yuan or 11.8 per sent in 1937, dropping slightly to 88,225,000 yuan or 4.4 per cent in 1938. On the other hand, the import of raw cotton has increased steadily from 9 million yuan in 1935 to 18 million yuan in 1936, 32 million yuan in 1937, and 43 million yuan in 1938. The increase in the importation of silk and woollen goods has been also noticeable, altogether showing the rising purchasing power of the populace in general. The imports of gunny bags, sugar and paper are steadily on the increase also. A marked decrease in the importation of wheat flour has been strikingly noticeable, decreasing from 53,989,000 yuan in 1935 to 27,116,000 yuan in 1936 and 13,828,000 yuan in 1937 but again rising to 47,089,000 yuan in 1938. This eloquently indicates an increasingly important place which the flour industry is beginning to occupy in Manchuria. On the whole, the import figures continue to show the tremendous amount of construction activities which are in progress under the Five-Year Industrial Plan and also the increase of the purchasing power of the Manchurians in general brought about by the thorough reform of the former chaotic currency system and the initiation of good administration under the new régime.

The following tables show the principal imports and exports comparatively for four years between 1935 and 1938.

PRINCIPAL COMMODITIES OF EXPORT

(In Yuan)

Commodities	1935	1936	1937	1938
Soya Beans	126,329,191	210,250,528	222,932,539	234,263,340

Transportation

The Railway Act, 1933 Simultaneously with the establishment of the State railway system, the Manchoukuo Government enacted the Railway Act of 1933, on February 9, 1933, after studying the conditions of these railways which were managed by diverse methods, entailing serious loss, and contemplated nationalization of the whole system in order to develop the economic wealth

railway connections and other facilities and the port of Rashin had grown almost overnight to a city embracing 24,500 people. The accompanying table shows the rapid increase of trade at Rashin which naturally followed the progress of the harbour construction activities.

TRADE AT RASHIN, 1937-1938

(Unit: 1,000 Yen)

Years	Exports	Imports	Total
1937	28,683	11,766	40,449
1938	28,683	21,590	100,273

2. Port of Hulutao. In 1935, the South Manchuria Railway Company, through the Manchoukuo Government, had launched a five year harbour construction programme at Hulutao. The development of Hulutao was undertaken for the purpose of providing facilities for handling an increasing movement of goods to and from the Liaosi regions or the south-western part of Manchoukuo. The project involved the construction of two main piers together with various appurtenant equipments at a total estimated cost of some 20,000,000 yen with a view to increasing the cargo handling capacity of the port to 3,500,000 tons a year when the project is completed in the spring of 1941. The work was actually started in April, 1936, and the project has been progressing on schedule since. Thus, by the end of 1938, one pier had been completed and the foundations were laid for the second, trebling the cargo handling capacity from 65,000 tons in 1937 to 200,000 tons. However, in consideration of the increasing importance of Hulutao in connection with the Five-Year Industrial Plan and the looming closer relationship with North China since the beginning of the China Incident, the original project had been revised in 1938 to expand and to increase the capacity of the port to 4,000,000 tons a year. Under this revised project, requiring an additional estimated expenditure of 10,000,000 yen, both Piers 2 and 3 will be opened for use in 1939, while Pier 4 will also be completed during the same year, raising the capacity to 1,000,000 tons. The entire project is scheduled for completion by the spring of 1940.

3. Five-Year Harbor Expansion Programme. The initiation of the Five-Year Industrial Plan and the subsequent explosion and continuation of the China Incident have decidedly increased the movement of goods to and from Manchuria. Even the port of Dairen, with its capacity to handle 10,000,000 tons of cargo annually, became too limited to face the changed situation. Thus was drawn up in 1938 a Five-Year Harbour Expansion Program. At Dairen, among other things, it proposes to complete the Pier 4 which was started back in 1923 but which had been discontinued since and to construct two new piers at Jijiko, raising the eventual capacity to 12,000,000 tons; at Kanseishi, across the bay from Dairen, it proposes to construct a special pier for handling of iron and steel products; and at Yingkou, among other things, it proposes to add a new wooden pier and a warehouse. These various projects and appurtenant equipments were started in 1939 at an estimated expenditure of some 130,000,000 yen. The construction of the Pier 4 at Dairen was resumed even earlier, in 1938, and is scheduled to be completed in 1939, while the two new piers at Jijiko will be started in 1939. The new Kanseishi pier will be started also in 1939 and completed in the spring of 1942.

4. Port of Shiaoshihkou. Among the various features of Manchoukuo's harbour expansion programme, a part of which has been already outlined above, the most interesting is the proposal to construct a non-freezing port at Shiaoshihkou, some 20 miles south-west of Antung. Another five-year programme of construction is drawn up for this purpose and the work will be started in 1939 with an initial estimated expenditure of some ¥7,000,000 for the first year. When completed, the new port of Shiaoshihkou will have facilities to handle 2,000,000 tons of cargo a year. Side by side with the construction of the port, an equally far-reaching project for the construction of an extensive industrial district will also be lauched. It may be added also that the Government General of Chosen is constructing a similar port at Tashi Island near by, which will have a cargo handling capacity of 1,000,000 tons a year.

Extension of Highways Since the announcement by the Manchoukuo Government in 1932 of its programme to construct some 60,000 kilometres of national highways in ten years, various circumstances necessitated its slight modifications. It assumed the form of the First and Second Five-Year Highway Construction Projects. The First Five-Year Project covered the years 1932-1936 and involved the construction of 9,809 kilometres of national highways and 20 special bridges at an estimated expenditure of 30,785,000 yuan, while the Second Five-Year Project, extend-

with the management of the North Chosen Railways within its hands and the vast resources of North Manchuria tapped through the Manchoukuo State Railways, the S. M. R. Company, in co-operation with Manchoukuo, has become the pioneer agency in the development of North and Northeastern Manchuria.

The Length of the Lines Operated The following table gives the progress of railway construction activities during 1936-1938, year by year:

NEW RAILWAY LINES COMPLETED, 1936-1938

1936

Lines	Length in Kms.
Pingchuan-Chengte	97.4
Mutankiang-Linkou	110.0
Linkou-Mishan	170.9
Solun-South Hsingan	130.8
Ssupingkai-Hsian	82.5
Total for 1936	591.6

1937

Lines	Length in Kms.
Linkou-Chiamussu	221.5
Noho-Nonkiang	93.5
Taipingchuan-Lupei	192.3
South Hsingan-Halunarshan	15.4
Ihsien-Fuhsin	78.1
Fuhsin-Shinlitun	53.4
Meiho-Tunghua	130.2
Mishan-Hulin	160.9
Total for 1937	945.3

1938

Lines	Length in Kms.
Lungtanshan-Tafengman	22.4
Chengte-Kupeikou	106.3
Total for 1938	128.7

UNDER PROVISIONAL OPERATION IN FEBRUARY, 1939

Lines	Length in Kms.
Tunghua-Huangpai	82.1
Wangching-Peihuangling	82.4
Suihua-Shenshu	135.8
Minghsan-Niuhsintai	13.3
Total under Provisional Operation	313.6

With these new lines added, the total length of new railways which had been constructed after the establishment of Manchoukuo reached 3,642.4 kilometres. This made the total length of the Manchoukuo State Railways 8,374.3 kilometres and the total length of all railway lines in Manchoukuo 10,148.4 kilometres, with the addition of 1,129.1 kilometres of the South Manchuria Railways, 102.1 kilometres of the Chin-Fu Railway, and 229.3 kilometres of private railways, at the end of March, 1939. In addition, 313.6 kilometres of the Manchoukuo State Railways were under provisional operation and the road beds of further additional 192.3 kilometres had been laid. Thus, within the scheduled ten years, Manchuria is combed by a net work of over 10,000 kilometres of railway lines. And the railway construction work still continues.

Construction of Harbours It has been noted in the Fifth Report that the expanding radius of Manchoukuo State Railways necessitated outlets to sea in addition to the existing ports of Dairen, Yingkou, Antung, and Port Arthur, and that the construction of Rashin and Hulutao harbours had been started by the Construction Bureau of the South Manchuria Railway Company. These construction activities have been progressing according to schedule during the period under review. In addition, plans were made for the construction of a new non-freezing port of Hsiaoshihkou and the expansion of existing ports, especially the port of Dairen.

1. Port of Rashin. A project of constructing a modern port on an erstwhile quiet fishing village at Rashin had been undertaken in 1932, and the work had been started actually in 1933. The project involves the completion by 1947 of most modern facilities for the handling of some 9,000,000 tons of cargo annually. One-third of this project, including all foundation works, was to be completed in five years by the spring of 1938, at an estimated cost of ¥11,206,000, the next one-third by the spring of 1942 at ¥11,139,000, and the last one-third by 1948 at ¥11,487,000. The first leg of this three-fold enterprise was started in April, 1933, and successfully completed on schedule, by the end of March, 1938, and the second leg was started immediately, at the same time giving finishing touches to the already completed portions of the project. In addition, a new project of constructing equipments across the Bay for the handling of local and coastwise trade had been started in 1938. Thus, at the end of 1938, two beautiful piers and one-half of the third pier, capable of handling 3,000,000-ton cargo annually, had seen their completion with necessary

Digitized by Google

railway connections and other facilities and the port of Rashin had grown almost overnight to a city embracing 24,500 people. The accompanying table shows the rapid increase of trade at Rashin which naturally followed the progress of the harbour construction activities.

TRADE AT RASHIN, 1937-1938

(Unit: 1,000 Yen)

Years	Exports	Imports	Total
1937	28,683	11,766	40,449
1938	28,683	21,590	100,273

2. Port of Hulutao. In 1935, the South Manchuria Railway Company, through the Manchoukuo Government, had launched a five year harbour construction programme at Hulutao. The development of Hulutao was undertaken for the purpose of providing facilities for handling an increasing movement of goods to and from the Liaosi regions or the south-western part of Manchoukuo. The project involved the construction of two main piers together with various appurtenant equipments at a total estimated cost of some 20,000,000 yen with a view to increasing the cargo handling capacity of the port to 3,500,000 tons a year when the project is completed in the spring of 1941. The work was actually started in April, 1936, and the project has been progressing on schedule since. Thus, by the end of 1938, one pier had been completed and the foundations were laid for the second, trebling the cargo handling capacity from 65,000 tons in 1937 to 200,000 tons. However, in consideration of the increasing importance of Hulutao in connection with the Five-Year Industrial Plan and the looming closer relationship with North China since the beginning of the China Incident, the original project had been revised in 1938 to expand and to increase the capacity of the port to 4,000,000 tons a year. Under this revised project, requiring an additional estimated expenditure of 10,000,000 yen, both Piers 2 and 3 will be opened for use in 1939, while Pier 4 will also be completed during the same year, raising the capacity to 1,000,000 tons. The entire project is scheduled for completion by the spring of 1940.

3. Five-Year Harbor Expansion Programme. The initiation of the Five-Year Industrial Plan and the subsequent explosion and continuation of the China Incident have decidedly increased the movement of goods to and from Manchuria. Even the port of Dairen, with its capacity to handle 10,000,000 tons of cargo annually, became too limited to face the changed situation. Thus was drawn up in 1938 a Five-Year Harbour Expansion Program. At Dairen, among other things, it proposes to complete the Pier 4 which was started back in 1923 but which had been discontinued since and to construct two new piers at Jijiko, raising the eventual capacity to 12,000,000 tons; at Kanseishi, across the bay from Dairen, it proposes to construct a special pier for handling of iron and steel products; and at Yingkou, among other things, it proposes to add a new wooden pier and a warehouse. These various projects and appurtenant equipments were started in 1939 at an estimated expenditure of some 130,000,000 yen. The construction of the Pier 4 at Dairen was resumed even earlier, in 1938, and is scheduled to be completed in 1939, while the two new piers at Jijiko will be started in 1939. The new Kanseishi pier will be started also in 1939 and completed in the spring of 1942.

4. Port of Shiaoshihkou. Among the various features of Manchoukuo's harbour expansion programme, a part of which has been already outlined above, the most interesting is the proposal to construct a non-freezing port at Shiaoshihkou, some 20 miles south-west of Antung. Another five-year programme of construction is drawn up for this purpose and the work will be started in 1939 with an initial estimated expenditure of some ¥7,000,000 for the first year. When completed, the new port of Shiaoshihkou will have facilities to handle 2,000,000 tons of cargo a year. Side by side with the construction of the port, an equally far-reaching project for the construction of an extensive industrial district will also be lauched. It may be added also that the Government General of Chosen is constructing a similar port at Tashi Island near by, which will have a cargo handling capacity of 1,000,000 tons a year.

Extension of Highways Since the announcement by the Manchoukuo Government in 1932 of its programme to construct some 60,000 kilometres of national highways in ten years, various circumstances necessitated its slight modifications. It assumed the form of the First and Second Five-Year Highway Construction Projects. The First Five-Year Project covered the years 1932-1936 and involved the construction of 9,809 kilometres of national highways and 20 special bridges at an estimated expenditure of 30,785,000 yuan, while the Second Five-Year Project, extend-

The total length of South Manchuria Railway lines open to business at the end of the fiscal year, March 31, 1938, remained the same as that of the previous year, viz. 1,129.1 kilometres.

Since its formal organization in 1906 the railway business of this company has grown with the years as is shown in the following table (in yen):

Year	Passenger Revenue	Freight Revenue	Other Revenue	Total
1907	3,594,239	6,160,274	14,375	9,768,887
1912	5,008,633	13,913,341	985,482	19,907,456
1916	6,040,453	19,882,476	1,892,420	27,815,349
1921	12,194,288	59,615,835	6,394,010	78,204,132

1927	16,102,953	94,040,819	3,100,408	113,244,180
1928	17,619,293	97,738,147	3,281,649	118,639,090
1929	17,451,585	101,089,474	3,562,684	122,103,743
1930	11,461,175	77,936,688	5,932,867	95,330,730
1931	9,135,663	70,897,756	4,539,937	84,573,356
1932	14,812,045	85,022,314	4,012,153	103,846,512
1933	16,434,000	94,263,000	8,980,000	119,677,000
1934	17,405,000	101,489,000	7,631,000	126,525,000
1935	22,412,000	103,362,000	8,911,000	134,686,000
1936	22,302,299	103,165,249	173,576,950	299,044,498
1937	24,875,527	115,558,375	214,612,237	355,048,139

Note: Figures for "other revenue" in 1936 and 1937 include receipts from coal mines and all other associated works.

In 1937-38 the number of passengers carried was 17,515,044, a gain of 2,200,000 over the previous fiscal year, and the tonnage of goods hauled was 24,331,393 metric tons, a gain of 3 million.

Among the goods transported by this railway, beans, bean cake, cereals and coal are the most important items.

(2) Accessory Business. In addition to its transportation business, the company is engaged in activities in many other fields including manufacturing.

Digitized by Google

warehousing, shipping, mining, real estate and building, and various public works.

(a) As regards manufacturing, the company makes and repairs its own locomotives and other rolling stock at its Dairen shop, which occupies a site of 340,000 tsubo in area.

(b) The company operates warehousing business at 31 different places at the wharf of Dairen and along its railway lines.

(c) As for marine transportation, the company started a steamship service between Dairen and Shanghai in 1907. The opening of the Tsingtao line and the Hong-Kong line followed later, the latter being intended to facilitate the shipping of the company's coal, mined at Fushun, to South China.

All these three lines were later transferred to the Dairen Steamship Company, which is capitalized at ¥25,000,000 by the company.

(d) Harbours are a wing of the railway business and are inseparable from it. Therefore, the South Manchuria Co., Ltd. has invested a sum amounting to ¥97,280,000 in Dairen, Port Arthur, Antung and Yingkow. Special attention has been devoted to the improvement of the harbour of Dairen, and the greater half of the entire harbour programme has already been finished, its present facilities being capable of handling 7,000,000 tons of freight annually with a berthing capacity of 190,000 tons of shipping at the same time.

(e) In mining, the company operates coal mines at Fushun and Yentai, and in addition to this, it is also engaged in shale-oil mining and steel foundry work.

(f) In the railway zone, the company is engaged in the real estate, building business and municipal administration, attending to the needs of sanitation, education and policing, while at the same time promoting agriculture, industry, commerce and mining in this area. The sum invested by the Company in these branches of work amounts to ¥188,620,000.

(g) The landed estate owned by this company extends over a total area of 371,430,000 square metres, of which approximately 59,000,000 square metres is leased to individuals. The company also owns some 14,200 buildings, of which 859 are rented to individuals.

(h) Another notable achievement of the company is its city-planning in various places. Up to the present it has built 25 cities at Liaoyang, Mukden, Hsinking, Yingkow, Antung, and other places. In these places the company has constructed roads, bridges, sewerage, schools, parks, markets and other modern municipal facilities.

(i) In education, the company now operates 26 kindergartens, 36 primary Schools, 5 middle schools, 4 girls' high schools, 2 colleges, 1 university, 10 public schools for Chinese students, 34 business supplementary schools, 13 girls' housekeeping schools, 2 commercial schools, 1 mining school, and 6 other schools. It has also opened two public libraries, one each at Dairen and Mukden, and 27 other reading rooms with 566,782 books in November, 1937.

(j) Among other enterprises of the company are 87 hospitals and 1 sanatorium, and for research and experimental work it carries on a hygienic station, an agricultural station, a farm, a tobacco farm, a geological research station, a central experimental station, and other institutions.

(3) There are in Manchoukuo 72 companies directly connected with the S.M.R. Co., with an aggregate paid-up capital of M¥461,675,000, about 43 per cent of which is being borne by the mother company.

Communications

(1) Postal Service. The post office is under the direction of the Department of Communications and Manchoukuo now has 353 post offices and 783 postal agencies, as compared with 283 and 720, respectively, in March, 1932. Since July, 1932, postal charges for both domestic and foreign mails have been reduced. Postal savings which were started in May, 1933, now total M¥1,150,000 (end of Aug., 1935). Money orders can be exchanged between this country and Japan, as well as China, Germany, Dutch Indies, Poland and Netherlands. Ordinary mail between Manchoukuo and China, too, is now exchanged without serious hitch, while international postal air service has also been inaugurated.

With the pacification of Jehol in 1933, the Government succeeded in bringing the postal administration throughout the country under its complete control. Since then postal charges have been reduced for both domestic and foreign mails. In May, 1933, postal savings, telegraphic transfer, postal note and savings transfer, and account services were opened for the benefit of the masses. In addition the new administration has inaugurated an international postal air service. Japanese postal administration in the S.M.R. Zone was transferred to Manchoukuo in 1937.

1933	16,434,000	94,263,000	8,980,000	119,677,000
1934	17,405,000	101,489,000	7,631,000	126,525,000
1935	22,412,000	103,362,000	8,911,000	134,686,000
1936	22,302,299	103,165,249	173,576,950	299,044,498
1937	24,875,527	115,558,375	214,612,237	355,048,139

Note: Figures for "other revenue" in 1936 and 1937 include receipts from coal mines and all other associated works.

In 1937-38 the number of passengers carried was 17,515,044, a gain of 2,200,000 over the previous fiscal year, and the tonnage of goods hauled was 24,331,393 metric tons, a gain of 3 million.

Among the goods transported by this railway, beans, bean cake, cereals and coal are the most important items.

(2) Accessory Business. In addition to its transportation business, the company is engaged in activities in many other fields including manufacturing,

Digitized by Google

of communication facilities between Japan, Chosen and Manchoukuo, the Company commenced work recently on a long-distance submarine cable at a cost of ¥14,000,000. Part of the cable, or that over the land section between Mukden and Antung, has already been completed. The distance between these two places is 280 kilometres, and the cable used is of non-loading variety, which marks a novelty in technique and material, and is the first experiment of its kind in the world.

Heretofore, international communications were possible only at Dairen through the Dairen-Chefoo submarine cable, and at Harbin which possessed facilities for wireless communication with Peking, Tientsin and Shanghai. In February, 1935, the Company revived the Mukden-Tientsin telegraph service, and in June of the same year, telephone connections between the two cities were restored. In October of the same year, an agreement was signed between Manchoukuo and China for handling messages in the Japanese language.

Communications wih Europe and America were perfected in March, 1934, the equipment used being entirely of Japanese make. Continuous two-way radio connections with Berlin and San Francisco were made available at the Hsinking wireless station, while in December, 1935, direct two-way contact with Paris was inaugurated.

There were 363 offices handling telegrams in Manchuria in September, 1933, and the number increased to 691, at the end of 1937, an increase of 328 offices since the formation of the Company. The various offices are classified as follows:

	1934	1935	1936	1937	Comparison between 1936 and 1937
Telephone and telegraph offices	75	95	124	187	+63
Telegraph offices	148	136	147	100	-47
Offices handling telegrams	222	243	249	275	+26

	1934	1935	1936	1937	Comparison between 1936 and 1937
Offices handling both telegrams and telephone calls	2	6	7	4	- 3
Offices handling telegrams and telephone messages	14	27	38	71	+33
Wireless stations	1	—	—	—	—
Stations handling wireless messages	38	48	51	54	+ 3
Total	504	555	616	691	+75

With the increase in the number of offices for handling telegrams, a surprising increase was seen in the number of telegrams transmitted. In 1930, there were only 4,770,000 messages sent and received, but in 1933 (the year the Company was established) there were 8,730,000; 10,340,000 in 1934, 21,750,000 in 1935, and 25,240,000 in 1936. The monthly figures for 1937 follow:

NUMBER OF TELEGRAMS HANDLED IN 1937

(Jan.—Sept.)

	No. of telegrams including those relayed	Index No. (Base: Sept 1933=100)
January	2,108,848	186
February	1,817,412	160
March	2,602,892	230
April	2,332,195	206
May	2,310,300	204
June	2,195,934	194
July	2,461,168	217
August	2,506,889	221
September	2,479,517	219

Frequency of international messages handled is on the increase, the figures for the year beginning October, 1936 and ending September, 1937, were as follows:

Messages sent	275,551
Messages received	269,537
Total	545,088

TELEPHONE SUBSCRIBERS ACCORDING TO NATIONALITY

	1934	1935	1936	1937 (Aug.)
Manchoukuoans	12,707	17,634	21,701	25,660

(2) Telegraph, Telephone and Radio Services. By virtue of the agreement concerning the establishment and joint management of a communications company signed between Japan and Manchoukuo, the Manchuria Telegraph and Telephone Company was established on March 26, 1933, capitalized at ¥50,000,000. The Company was entrusted with the management, improvement, unification and control of the communication systems in Manchoukuo.

The Company's head office is located in Hsinking while its branch offices are in Dairen, Mukden, Hsinking, Harbin, and Tsitsihar, and a district office in Chengte.

Since the machinery and equipment which the Company took over were in a very poor condition with the exception of those in the Kwantung Territory and the South Manchuria Railway zone, the Company undertook vast improvement and expansion programme costing ¥2,000,000 in 1933, and ¥10,000,000 annually since 1934. The appropriations made by the Company since 1933 are as follows:

Transferred property	¥21,358,414
Accounts for 1933	2,868,048
,, ,, 1934	11,012,652
,, ,, 1935	10,130,940
,, ,, 1936	10,647,134
,, ,, 1937 (1st six months)	1,550,153
Total	¥57,567,341

Following the transfor of the North Manchuria Railway to Manchoukuo from Soviet Russia, by virtue of the agreement signed on March 23, 1935, the Manchuria Telegraph and Telephone Company came into possession of all the establishments and equipment owned and operated by the N. M. Railway. Extensive improvements were made on the existing facilities, while new offices were created at the important railway stations where there were no telephone or telegraph connections. The Company eliminated all the inconveniences of communication between North and South Manchuria experienced in past years and perfected the communication facilities linking the two regions.

Telegraph and telephone administration in the Chientao district which lies on the border between Chosen and Manchoukuo, was in the hands of the Chosen Government's Bureau of Communications. The telegraph and telephone stations located at Lungchingtsun, Yenki, Hunchun, and Toutaokuo under Chosen Government were taken over by the Company on April 1, 1936, after satisfactory negotiations.

The demand for communication between Japan, Chosen, and Manchoukuo has been increasing year by year, and the Company has been doing everything possible to meet the requirements and has produced remarkable results. Through its newly established huge wireless station at Hsinking, the Company inaugurated radiophone service on August 1, 1934, between Tokyo and Hsinking, linking all the cities in Japan with the important municipalities in Manchoukuo, bringing the two countries much nearer than ever before. In addition to this, direct telegraphic connections have been established between Manchoukuo and North Chosen, a region which is witnessing remarkable industrial development, while direct telephone and wireless connections have been completed. Foreseeing the need for further expansion

Digitized by Google

of communication facilities between Japan, Chosen and Manchoukuo, the Company commenced work recently on a long-distance submarine cable at a cost of ¥14,000,000. Part of the cable, or that over the land section between Mukden and Antung, has already been completed. The distance between these two places is 280 kilometres, and the cable used is of non-loading variety, which marks a novelty in technique and material, and is the first experiment of its kind in the world.

Heretofore, international communications were possible only at Dairen through the Dairen-Chefoo submarine cable, and at Harbin which possessed facilities for wireless communication with Peking, Tientsin and Shanghai. In February, 1935, the Company revived the Mukden-Tientsin telegraph service, and in June of the same year, telephone connections between the two cities were restored. In October of the same year, an agreement was signed between Manchoukuo and China for handling messages in the Japanese language.

Communications wih Europe and America were perfected in March, 1934, the equipment used being entirely of Japanese make. Continuous two-way radio connections with Berlin and San Francisco were made available at the Hsinking wireless station, while in December, 1935, direct two-way contact with Paris was inaugurated.

There were 363 offices handling telegrams in Manchuria in September, 1933, and the number increased to 691, at the end of 1937, an increase of 328 offices since the formation of the Company. The various offices are classified as follows:

	1934	1935	1936	1937	Comparison between 1936 and 1937
Telephone and telegraph offices	75	95	124	187	+63
Telegraph offices	148	136	147	100	-47
Offices handling telegrams	222	243	249	275	+26

	1934	1935	1936	1937	Comparison between 1936 and 1937
Offices handling both telegrams and telephone calls	2	6	7	4	- 3
Offices handling telegrams and telephone messages	14	27	38	71	+33
Wireless stations	1	—	—	—	—
Stations handling wireless messages	38	48	51	54	+ 3
Total	504	555	616	691	+75

With the increase in the number of offices for handling telegrams, a surprising increase was seen in the number of telegrams transmitted. In 1930, there were only 4,770,000 messages sent and received, but in 1933 (the year the Company was established) there were 8,730,000; 10,340,000 in 1934, 21,750,000 in 1935, and 25,240,000 in 1936. The monthly figures for 1937 follow:

NUMBER OF TELEGRAMS HANDLED IN 1937

(Jan.—Sept.)

	No. of telegrams including those relayed	Index No. (Base: Sept 1933=100)
January	2,108,848	186
February	1,817,412	160
March	2,602,892	230
April	2,332,195	206
May	2,310,300	204
June	2,195,934	194
July	2,461,168	217
August	2,506,889	221
September	2,479,517	219

Frequency of international messages handled is on the increase, the figures for the year beginning October, 1936 and ending September, 1937, were as follows:

Messages sent	275,551
Messages received	269,537
Total	545,088

1937 (November)	84,452	43,250	104.9%

Justice and Police

General The present judicial system of Manchoukuo comes largely from the old Chinese system, which existed before the founding of Manchoukuo.

Before the unification of the country by the National Government, the number and grades of new courts established in China proper, the Three Eastern Provinces and other districts were as follows :

1. Supreme court, 1; supreme court prosecutorate, 1 at Nanging.
2. High court and high court prosecutorate, 23.
3. Branch high court and branch high court prosecutorate, 26.
4. District court and district court prosecutorate, 66.
5. Branch district court and branch district court prosecutorate, 25.

After the founding of Manchoukuo the old system has been revised several times due to the contradiction it involves being inimical to the other ex-

The Hsinking Medical College Under the former regime health and hygienic facilities were likewise neglected. The South Manchuria Railway Company alone had a medical college in Mukden and managed a number of fine hospitals in the S.M.R. Zone. In many districts various malignant diseases were prevalent and the sanitary condition of the general community was such as to cause no small anxiety. Since the birth of the new State the Manchoukuo authorities have been exerting their utmost efforts to prevent epidemics and to spread knowledge of hygienic living among the people. As the training of competent doctors and their stationing in different parts of the country are most essential in realizing the above purposes, the Government transferred the medical school attached to the Kirin National Hospital, to Hsinking in March, 1938, and renamed it the Hsinking Medical College. Modern equipment has been installed at this institution which has at present an enrollment of 285 students. Its course is four years.

The Tatung Academy Of the various educational institutions founded since the birth of Manchoukuo, the Tatung Academy in Hsinking is probably the most unique.

The Tatung Academy was established for the purpose of training government officials and young men entering government service, in the spirit underlying the foundation of Manchoukuo and also practically, to qualify them for the task of building up the new State. It was founded in July, 1932, only a few months after Manchoukuo was born, because the training of many such men was vitally necessary at the time.

This unique establishment is under the control of General Affairs Board of the State Council, and admits graduates of institutions above higher schools and colleges, and officials already in government service. It is divided into two sections, one for Japanese and the other for Manchurians. Besides giving necessary courses in political science, economics, geography and history, the Tatung Academy conducts surveys of actual rural conditions, lets Japanese students travel in various parts of Manchoukuo, and sends Manchurian students to tour Japan.

The National University The National University was founded in Hsinking in May, 1938, with the object of propagating the sprit in which the new State was founded, and of educating men who will become builders of a moral society and leaders in the work of national enlightenment. It is under the direct supervision of the Premier. All educational expenses of the students admitted to this institution are borne by the State.

The National University offers a six year course, divided into two courses of three years each. Those who have completed secondary education are admitted to the basic course upon passing entrance examiations. Those finishing this course and graduates of colleges and universities are admitted into the advanced course after rigorous selection. Higher ordinary education is chiefly given in the basic course, with emphasis placed upon the study of the spirit of national foundation and actual training for developing the spirit of service, which is also given in the advanced course. The subjects taught in the advanced course are political science, economics, logic and philosophy. All the students are housed in dormitories in order to inculcate discipline and the spirit of self-government. The National University was opened with an enrollment of 150 in the basic course.

The National University, according to plans, will have separately a graduate school and a research institute. The former will admit those graduating from the advanced course or those of similar scholastic standing, who will further specialize in their selected fields. The faculty will form the organization of the research institute which will serve as an agency for research in various studies.

Religion The principal religions in Manchoukuo are Confucianism, Buddhism, Taoism, Lamaism, and Mohammedanism. Christianity was introduced in 1858. In April, 1934, the Holy See formed a separate mission field in Manchoukuo, independent from that of China, and appointed the Rt. Rev. Bishop A. Gaspais as Acting Apostolic Delegate for the whole of Manchoukuo. The latest available number of preachers and believers for each and the number of temples, shrines, and churches follow :

Medicine and Sanitation

Sanitary Conditions The climate of Manchuria is not at all unhealthy. But since the country is extensive, bordering on Mongolia and Siberia and inhabited by different races, many of whom lead an insanitary life in extremely primitive conditions, and especially since coolies and refugees are constantly migrating in large groups, the risk of the spread of dreadful infectious diseases is rather common. In the past twenty years, Manchuria has been often afflicted by such plagues; for instance, the pneumonic plague in 1910–1911, cholera in 1919, pneumonic plague again in 1920–1921, and pneumonic plague once more in 1927. Another plague is the pest which destroyed the lives of 900 people in 1934. But due to vigorous exertion made jointly by the Department of Civil Affairs, the Department of Mongolian Administration and the South Manchuria Railway Co. special districts have been mapped, isolation hospitals and lookouts established and they have been placed under supervision of the pest investigation institute. Owing to the activities of these institutions as well as the thoroughness in inoculation the number afflicted by pest in 1935 was reduced to one-half of that of 1934.

Medical Institution The administration of hygiene of the country is undertaken by the Bureau of Hygiene of the Department of Civil Affairs. As regards the facilities of the administration of hygiene they have organs established in various provinces, in North Manchuria Special District, in Hsinking, in various hsiens, the police stations, etc. Though medical institutions in large cities in the Kwantung Leased Territory and the South Manchuria Railway Zone are well equipped the situation is quite different in local districts and is not so good. State hospitals are located in Kirin, Harbin and Chengte where patients numbering about 25,000 are received every month. Among public hospitals there are Feng-

Digitized by Google

tien City Hospital, the Harbin First and Second Hospitals and a few others which are under construction. Physicians in the public service number 67 in all and it was planned that there would be at least one public physician in every hsien. In addition there are some private hospitals. The number of places where there are public physicians and private hospitals are as follows :

Province	No. of Places	
	Public Physicians	Private Hospitals
Fengtien	5	1
Pingkiang	9	2
Sankiang	8	2
Kirin	6	2

Medical Education As organs for educating medical students there are only the Medical School attached to Kirin Government Hospital College and the Harbin Medical College. All the other educational organs are under management of foreign countries. They are the Manchuria Medical University and College, Fengtien Medical College, Harbin First and Second Dental School, and one pharmaceutical school under Russian management. But all except the Manchuria Medical University, are poorly equipped. In view of this, the Manchuria Medical College opened its technical course in 1933 and now admits Manchurian students.

For the improvement of national health, and especially for the successful realization of the ten-year anti-narcotics plan which was launched in 1937 in order to eradicate narcotic evils for which Manchuria was rather notorious under the former régime, Manchoukuo is urgently in need of more medical facilities and a greater number of efficient doctors. Such being the case, the government has recently

Digitized by Google

decided to raise the medical school at Hsinking to college standing. The construction of the building for the new college, costing M¥339,200, is to start early in the spring of 1938 and expected to be finished early in 1939.

Sanitation With central epidemics prevention organ in the Bureau of Hygiene there are various sanitary institutions placed in local districts. There are also installed six quarantine stations at the frontier which have been established as permanent organs. As an organ for the prevention of pest 2 pest investigation institutes, 9 isolation hospitals and 9 lookouts which are permanent institutions have been established. Quarantine and the hygiene of the ports of Dairen and Port Arthur are under the direction of the Marine Office of the Kwantung government and its branch.

Hygienic investigations and inspections are conducted by the following institutions: The Central Laboratory, the Hygiene Institute and the Animal Disease Research Institute of the South Manchuria Railway Company; the government hospitals at Dairen and Port Arthur; physicians, veterinary surgeons and pharmaceutists stationed by the Kwantung government at civil administration offices, police stations and sub-stations.

The Hygienic Institute was established in 1925 by the railway company at an outlay of ¥400,000 in view of the lack of facilities for pathogenic investigations, and also for the supply of preventive and curative medicines.

Vaccines, serums, and disinfectants produced at the Institute are distributed free or at cost not only in Manchuria but also in Tientsin and Shantung districts. The latest statistics for production and distribution of vaccines and serums give the following figures:

	Vaccines and serums manufactured in cc.	Products sold or distributed in cc.
1928	21,856,857	21,128,423
1929	25,574,962	25,513,384
1930	30,801,140	30,728,469

The Animal Disease Research Institute of the South Manchuria Railway Co., was established in 1925 at Mukden at a cost of ¥250,000. The Institute is divided into the Research and Enterprise Divisions. The Enterprise Division manufactures and distributes serums, vaccines and medicines for various animal diseases, conducts classes and lectures on animal diseases, gives itinerant medical treatment by sending free treatment and research corps, and also operates the examination station in the Institute.

Extermination of Opium Evil The painstaking efforts of the new State during the past four years since the enforcement of the Opium Law in January, 1933, to curb the drug habit were not made in vain, and the Government, having established an efficient monopoly system, has succeeded in completing its preparatory period for the eradication of the evil. In view, however, of the fact that conditions at home and abroad demand the immediate extermination of the opium menace, the Government authorities have formulated a ten-year plan under which they hope to prevent the appearance of fresh cases and to cure the present addicts. Concerning this ambitious project, which was launched in 1938, Premier Chang Ching-hui, in an announcement made on August 12, 1937, stated in part:

In accordance with its policy framed at the time of the foundation of the new State to eradicate the opium evil in the country, the Manchoukuo Government enforced an opium monopoly and established various facilities for its smooth execution. Though much appreciable results have been achieved, the Government keenly realizes the necessity of augmenting the policy in order to exterminate the age-long curse, especially at a time when general conditions in the country strongly call for national unity and readjustments, externally and internally. The Government has therefore firmly decided to expand and improve the existing facilities, enforce more stringent regulations and to surmount all difficulties to exterminate the evil practice as early as possible.

The main points of the ten-year programme are:

1. Reformatory education. Every effort will be made to propagate the necessity of abolishing opium smoking through the medium of educational and social institutions, while at the same time, a national anti-opium campaign will be launched through the Manchoukuo Concordia Association to awaken the people to the deadly effects of opium-smoking.

2. Prevention of the appearance of fresh cases.

(a) More effective control over the issue of certificates to addicts will be exercised, and no person under 25 years of age will, under any circumstances, be permitted to smoke five years after

Medical Education As organs for educating medical students there are only the Medical School attached to Kirin Government Hospital College and the Harbin Medical College. All the other educational organs are under management of foreign countries. They are the Manchuria Medical University and College, Fengtien Medical College, Harbin First and Second Dental School, and one pharmaceutical school under Russian management. But all except the Manchuria Medical University, are poorly equipped. In view of this, the Manchuria Medical College opened its technical course in 1933 and now admits Manchurian students.

For the improvement of national health, and especially for the successful realization of the ten-year anti-narcotics plan which was launched in 1937 in order to eradicate narcotic evils for which Manchuria was rather notorious under the former régime, Manchoukuo is urgently in need of more medical facilities and a greater number of efficient doctors. Such being the case, the government has recently

Digitized by Google

largest and best equipped stadiums on the Asiatic continent. Compared to foreign municipalities, Hsinking has set aside 7% of its city area for parks, playgrounds and stadiums, against 2% of Berlin, 2.8% of Tokyo, 1.4% of Washington, and 9% of London.

Hsinking also boasts the best water supply system in Manchoukuo. The present system can best be appreciated by comparing it with the water supply system of the Changchun days. Under the former régime, there were water mains only in the S. M. R. zone. The majority of the residents of other sections had to buy drinking water at so much a pail. Good pure water comes from the Chingyuehtan reservoir in the suburbs of the city, another huge project completed under the first five-year plan of Capital Construction. Covering an area of 78 square kilometres, the mammoth reservoir utilizes water from a tributary of the Itung River, and enough water is stored there to supply a population of half a million.

Mukden Mukden (Fengtien), formerly the seat of the old militarist government of the Chang family, still retains its prosperity as a commercial and industrial centre of Manchoukuo situated as it is in the heart of a vast plain watered by the Liao River.

The main line and the Antung-Mukden line of the South Manchuria Railway, the Mukden-Shanhaikwan Railway, and the Mukden-Hailung Railway converge at Mukden thus making this city an important point of communication between Europe and Asia.

As an industrial centre, Mukden produces matches, bean-oil, rice, pottery, textiles and tobacco. This city also is a centre of education in Manchoukuo, among its important schools being the Manchuria Medical College, in addition to several primary and secondary schools for boys and girls.

The population of the open town and the railway zone of Mukden at the end of 1937, numbered 711,085, of which 83,542 are Japanese nationals.

Dairen Dairen is the most important port for Manchoukuo. Located in the Leased Territory of Kwantung the city is under Japanese administration. Starting from this city, the main line of the South Manchuria Railway runs north as far as Hsinking, branching off at Mukden to Antung.

The city is built on the shore of the Bay of Dairen, extending 7.8 kilometres from east to west and 3 kilometres from north to south. Divided into the residential, mixed, commercial and industrial districts, the city is well planned, with a sewerage system, parks and other modern public utilities completed by the Japanese.

In 1915 the city was organized as an autonomous municipality and efforts have since been continued to perfect its sanitary and educational institutions and fire-preventing facilities.

From the central square covering an area of more than 10,000 tsubo, 10 boulevards radiate in all directions, the streets of this city being of seven different widths with a maximum of 25 ken or about 50 yards.

Among the parks of the city, the Electric Park is the most famous. Hoshigaura Park, which is in Hoshigaura, a suburb of Dairen, is also well known for its golf links and sea-bathing beach.

Being the largest commercial centre of South Manchuria, the city has a population of approximately 503,778 of which 158,696 are the Japanese coming from Japan proper. Among the important offices in the city are the headquarters of the South Manchuria Railway Company, the city hall, the civil administration office, the bureau of communications, the chamber of commerce and industry, the branch offices of the Yokohama Specie Bank, the Chosen Bank, the Oriental Colonization Company, the Central Bank of Manchou, the Chenglung Bank, the Mitsui Company, the Mitsubishi Company, the Okuragumi, Mitsukoshi and other business concerns.

Various local institutions include the Manchuria Dockyard Company, the Dairen Steamship Company, the South Manchuria Electric Company and the Dairen Hospital. Among the schools in this city are 12 kindergartens, 14 primary schools, 2 middle schools, 2 girls' high schools, a commercial school, a girls' commercial school, a commercial and industrial school, a foreign language school and a technical college.

Ryojun (Port Arthur) Ryojun was once the seat of the government of the Kwantung Leased Territory. Situated at the southern tip of Liaotung peninsula, the city is surrounded by hills on all sides except on its water front, which forms a port opening to the Gulf of Pechihli.

The city is made up of two sections, the old town and the new town. In the old town are located the city hall, the dockyard, the defence headquarters, the higher law court, the civil administration office and the headquarters of Port Arthur fortress.

The new city is built on the shore of the west port and forms the government and school district with the for-

Digitized by Google

mer office of government of the Kwantung Leased Territory, the Ryojun Engineering College, and other schools located in it.

The boulevards of the city are of two different widths, 84 feet and 63 feet respectively, while the standard width of the street is 42 feet.

The vicinity of Ryojun is the old scene of the siege of Port Arthur during the Russo-Japanese War, and a smooth driveway now connects Ryojun and Dairen to take tourists to the old battlefields.

The population of the city is put at 31,000, of which about 12,000 are the Japanese nationals.

Yingkow Before the opening of Dairen, Yingkow was the only commercial port of Manchuria, and it enjoyed great prosperity. It is now known mostly as an industrial centre for manufacturing bean oil, tobacco, brick and soy sauce.

Being situated on the bank of the Liao River about 14 miles from its mouth, this town still plays an important rôle in the commerce of the river, meeting the needs of the rural populace along its banks. The town on the opposite bank of the river is known as Newchwang.

The population of the Japanese section of the city is put as 5,433 among the total population of 161,903 at the end of 1937.

Kirin Standing on the western bank of the Sungari River, Kirin is the terminus of the Kirin-Changchun Railway and is known as an important station in the transportation of lumber produced in the upper basin of the river.

Being one of the largest cities in Manchoukuo, it has a population of 122,586, of which 12,556 are the Japanese. As the city is kept comparatively clean, surrounded by shapely hills, Kirin is known among the Japanese as the Kyoto of Manchuria. Among other products marketed in this city are lumber, tobacco leaf, hemp and furs.

Harbin Special Municipality Harbin is situated on the eastern bank of the Sungari River, at 44.5 degrees North Latitude and 126.40 degrees East Longitude. Although now known as the Paris of the Far East, Harbin was only a deserted village before the Russian penetration into Manchuria.

Built in European style, the city has a population 457,980, of which 26,347 are the Japanese, 4,355 Koreans and 34,133 Russians.

From this city, the southern line of the North Manchuria Railway runs to Hsinking. The city also forms an important point in the long railway which links Vladivostok and the cities of Europe via Siberia.

As the largest commercial and industrial centre of north Manchuria, Harbin handles more than 4,000,000 tons of soy beans, wheat, bean-cake and other products annually.

The city was formerly divided into three sections: Old Harbin, the new city and the open town. The new city is said to have been planned after Moscow. The railway station, the offices of the North Manchuria Railway and the North Manchuria Railway and the foreign consulates are located in this section.

In the open town, which is the commercial section of the city, reside Russian, Japanese and Manchurian merchants engaged in thriving business activities. The Harbin offices of the Yokohama Specie Bank, the Chosen Bank and Mitsui Company are found in the open town.

In June of 1933 Harbin was made a special municipality and since July 1, 1933 the municipality became an autonomous city which comes under the direct control of the Department of Civil Affairs. Since then the old plan of extension of the city has been given up and the city is under construction according to a new plan which purports to make it ten times as large as that designed under the old plan

Kwantung Leased Territory

General and Historical The Kwantung Leased Territory under Japanese rule which was ceded to Japan by Russia and the lease of which lasts till 1997, together with the railway zone of the South Manchuria Railway Company, forms the most civilized area of Manchuria with all kinds of modern facilities introduced by the Japanese.

Occupying a small southern portion of Liaotung Peninsula, the Leased Territory covers an area of some 3,367.88 square kilometres with a population of 1,134,074 at the end of 1935, of which 163,796 are Japanese, 4,389 Koreans, 963,875 Chinese and Manchous and 2,014 people of other nationalities.

Government The government of the Kwantung Leased Territory at Ryojun is in charge of the civil administration office under the supervision of the Kanto Bureau, which is again placed under the Embassy at Hsinking.

In the beginning the territory was under military rule with an army officer as governor-general. This system was changed in 1919, and since then a civili-

Kwantung Leased Territory

General and Historical The Kwantung Leased Territory under Japanese rule which was ceded to Japan by Russia and the lease of which lasts till 1997, together with the railway zone of the South Manchuria Railway Company, forms the most civilized area of Manchuria with all kinds of modern facilities introduced by the Japanese.

Occupying a small southern portion of Liaotung Peninsula, the Leased Territory covers an area of some 3,367.88 square kilometres with a population of 1,134,074 at the end of 1935, of which 163,796 are Japanese, 4,389 Koreans, 963,875 Chinese and Manchous and 2,014 people of other nationalities.

Government The government of the Kwantung Leased Territory at Ryojun is in charge of the civil administration office under the supervision of the Kanto Bureau, which is again placed under the Embassy at Hsinking.

In the beginning the territory was under military rule with an army officer as governor-general. This system was changed in 1919, and since then a civili-

Digitized by Google

an officer was appointed governor of the territory by the Emperor of Japan. A drastic change was made in this system on December 26, 1934, in which the Kanto Bureau was established at Hsinking under the control of the Ambassador at Hsinking, and most of the administrative powers formerly vested in the governor of the Leased Territory were transferred to the president of the newly created Bureau. The president takes charge of the civil administration within the territory and supervises the business of the South Manchuria Railway Co. The Bureau is sub-divided into the president's secretariat, home affairs, police, and controller's divisions. At the same time a separate office was created for administration of the Peninsula. Under this office, which is at Ryojun, falls the administration of civil affairs in the Peninsula, the prisons, the Ryojun Engineering College, the middle schools, the girls' high schools, the normal school for natives, the commercial school for natives, the agricultural schools for natives, the Police Training School, the Meteorological Observatory, the government hospitals, the Agricultural Experimental Station, the Sericultural Experimental Station and several other institutions in the territory.

Finance Taxes are regularly collected, but due to a large expenditure required for improvement in hygiene, strengthening of police force, extension of educational facilities, development of industries, etc., the revenue from this source is not enough to meet the expenditure, so that subvention is allowed from the General Account. The budget for the financial year 1936–37 was as follows :

Revenue	
Ordinary revenue	¥4,760,276
Extraordinary „	¥2,510,243
Total	¥7,270,519
Expenditure	
Ordinary expenditure	¥3,544,089
Extraordinary „	¥3,726,430
Total	¥7,270,519

Of the ordinary revenue the income from taxes amounts to ¥2,066,278, that from the Government enterprises and properties to ¥2,393,450, while in the extraordinary revenue the Government subvention amounts to ¥1,747,412. The main items of expenditure included ¥2,084,432 for various subsidies, ¥1,510,251 for public works and repairs, ¥1,198,056 for various enterprises and ¥757,213 for education.

Justice and Communications In regard to the administration of justice in the Leased Territory, a judicial system was established in 1906 whereby the courts of justice were empowered to adjudicate in all civil and criminal cases, irrespective of the nationalities of the persons involved.

The defence of the Leased Territory is secured by a neutral zone along the northern frontier.

The communication system and educational, hygienic and other modern institutions are well organized in the territory. In matters concerning hygiene and sanitation, the Kwantung government is collaborating with the South Manchuria Railway Company.

CHINA

Area and Population

Owing to the lack of scientifically compiled statistics it is difficult to grasp the actual size of the territory and the population of China. The ambiguity of the international position is also in some way responsible, for in many cases, the Chinese make their calculations with Manchuria and Outer Mongolia still considered as integral parts of China while both of them are clearly independent of the Chinese Republic. As regards the various divisions and separations which have occurred from the political viewpoint following the outbreak of the China Incident, however, it would be more convenient to keep them out of consideration because the events closely associated with the occurrence are still in progress.

Area

The following figures are those available showing the area of the provinces included in China Proper and the border regions:

North China

Name of Province	Area in Square Kilometers	
Hopei	140,526	(153,682)
Shantung	153,711	(179,269)
Honan	169,782	(172,736)
Shansi	161,842	(155,935)
Shensi	195,076	(187,394)
Kansu	380,863	(378,059)
Total	1,201,800	(1,227,075)

Central China

Name of Province	Area in Square Kilometers	
Kiangsu	105,605	(108,339)
Chekiang	101,061	(103,058)
Anhwei	143,447	(134,426)
Kiangsi	168,326	(200,209)
Hupei	183,724	(207,692)
Hunan	215,457	(273,231)
Szechwan	403,634	(431,309)
Total	1,321,165	(1,458,264)

South China

Name of Province	Area in Square Kilometers	
Fukien	121,050	(158,702)
Kwangtung	223,844	(217,404)
Kwangsi	219,876	(217,578)
Kweichow	176,480	(179,478)
Yunnan	398,583	(320,051)
Total	1,139,833	(1,093,213)

Border Regions

Name of Province	Area in Square Kilometers	
Chahar	258,815	(278,957)
Suiyuan	304,058	(291,432)
Ninghsia	302,451	(274,910)
Chinghai (Kokonor)	728,198	(697,194)
Sikang	472,704	(371,599)
Tibet	904,999	(1,215,788)
Sinkiang	1,641,554	(1,828,418)
Total	4,612,779	(4,958,298)
Grand Total	8,275,577	(8,736,850)

(Note: The figures in parentheses were published by the Ministry of the Interior of the National Government on March 17, 1937, and do not cover the cities of Nanking, Shanghai, Peking (then Peiping), Tientsin, Tsingtao and Weihaiwei.)

In passing, it may be noted that the area of Outer Mongolia is given as 1,612,912 square kilometres (the figures published by the Ministry of the Interior of the National Government on March 17, 1937, being 1,621,201 square kilometres).

Foreign Concessions Following is a list of the foreign concessions, international settlements and leased territories in China:

	Location		Date of Creation		Area

Leased territory	Weihaiwei	1898	1922

Population

The inhabitants of China are generally divided into six tribes, the Hans, Tibetans, Miaos, Manchus, Mongols and Turks. The Hans, found all over China, account for more than 90 per cent of the total population. They are prolific, highly civilized and have great economic power. The total number of Tibetans is estimated at approximately 2,000,000, all living in Tibet. Their standard of civilization is low. The Miaos are aborigines of China and at present inhabit the two provinces of Kweichow and Yunnan, having been gradually driven to these southwestern provinces by the Hans. The Manchus, who were the founders of the now defunct Ching dynasty, migrated, during the time they were in power to various parts of China Proper, where they were assimilated with the Hans. At present they are estimated to number some 5,000,000 persons. The Mongols, of whom there are probably about 800,000, inhabit chiefly Inner and Outer Mongolia, though some of them are found in Sinkiang and Chingkai (Kokonor). The Turks live in Kansu, Shensi and Sinkiang, their number being estimated at about 10,000,000.

Figures for the total population of China vary according to estimates from different sources. The Ministry of the Interior of the National Government reported in 1928 that the country had a total population of 474,787,386 persons. The Year Book published by the Shen Pao gives the total population as 433,077,785 persons. The average density of population in the 18 purely Chinese provinces is given as 110 persons to each one square kilometre. Details of the figures compiled by the Shen Pao, excluding those for Manchuria and Outer Mongolia, are tabulated as follows:

Digitized by Google

	Number of Households	Population	Density of Population (per one square kilometer)
Kiangsu Province	6,998,389	35,102,524	336.77

Chinese Abroad The number of the Chinese residents abroad is estimated at 7,838,895 persons by the committee on affairs concerning Chinese residents abroad, according to the 1925 edition of the year book compiled by the Shen Pao. The 1936 edition gives two different figures, one being 8,758,533 persons and the other 11,405,332 persons (because two different figures are given for the Chinese residents in Siam and the Dutch Indies). It must be noted that the above figures also include Formosans. With the Formosans excluded, it is believed that the Chinese residents abroad at present number about 6,500,000 persons, including 2,500,000 in Siam, 1,825,000 in the Dutch Indies, 1,273,000 in Malay and the Straits Settlements, 381,000 in the French Indo-China, 193,000 in Burma, 75,000 in the United States, 47,000 in the British North Borneo, 43,000 in the Philippines and 46,000 in Taiwan.

The economic power which the Chinese residents abroad possess is not small. Through their homeward remittances, the Chinese residents in foreign countries have been making a great contribution towards balancing the trade of their homeland with foreign nations. At one time, the total amount of remittances which the Chinese residents made to their homeland was estimated at more than 400,000,000 yuan, but a decrease has been brought about by the recent economic depression.

Density of Population Density of population in China is estimated at 1,405 per square mile, headed by Kwangton with 3,011. In northern 5 provinces it is said to be 629, in provinces along the Yellow River valley 1,171, in provinces south of the Yangtze 2,108.

Digitized by Google

Distribution by Age Group The distribution of population by age groop is supposed to be as follows:

Age Groop	Percentage
Under 9	22.2
10—19	19.5
20—29	17.1
30—39	14.8
40—49	11.8
50—59	8.4
Over 60	6.3

Marriage The average year of marriage of Chinese people is placed at 20.6 for men and 18 for women.

Birth and Death Rates According to the reports of major cities in China in 1929 death rate was higher than birth rate in all reported cities, except Peking. Nanking reported 5 births per 1,000 of population and Tientsin but 3 births per 1,000 of population. Yearly reports of the Kuomintang Government give a death rate of 20 per 1,000 of population. But that all these reports are unreliable is the unanimous opinion of Chinese scholars both native and foreign. A Chinese scholar puts birth rate as 38.2 per 1,000 of population, death rate 25.8 and the rate of annual increase of population 12.4. But this scholastic conclusion is untenable, because the present Chinese population will be doubled in the coming 10 years and reach over 800 million, and such a matter will never happen judged from the history of Chinese population in the past.

Kuomintang and Government

Following the Opium War and the Taiping Rebellion, the corruption of the Ching dynasty and the oppression by foreign countries came to be felt more keenly than ever before and after the weakness of China had been demonstrated by the result of the Sino-Japanese War, 1894-5, the country became the objective of the struggle of the Powers for rights and interests. This, coupled with the imposition of the enormous indemnity in connection with the Boxer Uprising by the interested Powers, spelt ruin to the Ching dynasty. Endeavours were made to resuscitate it through reforms, but in vain.

Birth of the Chinese Republic The revolutionary drive which was launched in the Wuhan area on October 10, 1911, spread like wild-fire and on January 1, 1912, a provisional government was established in Nanking with Sun Yat-sen, the "father of the Chinese Republic," designated as President ad interim.

Unable to completely overcome the old influence in the north, however, the revolutionaries concluded a compromise with Yuan Shih-kai, representing the Ching dynasty, under which the Emperor abdicated his throne and the Chinese Republic was formally inaugurated. Sun Yat-sen then resigned as President ad interim to be succeeded by Yuan Shih-kai who assumed office in Peking, but there was a deadlock for sometime as to whether this city or Nanking should be the capital. As representative of the revolutionaries, Li Yuan-hung was designated Vice-President. In the third year of the Republic, the first cabinet of the new regime was formed, with Tang Shao-yi as the Prime Minister.

In the meantime, the Kuomintang or Nationalist Party was brought into being as a strong rival of the faction headed by Yuan Shih-kai. The rivalry led to the assassination in the North Station of Shanghai of Sung Chiao-jen, one of the most capable of the southern leaders, and was one of the many events which led to the subsequent second revolution launched in Kiangsi by Li Lieh-chun against the Peking faction. After about two months of fighting the revolutionaries were defeated by Feng Yu-hsiang and Chang Hsun.

The national assembly was inaugurated in April of the second year of the Republic (1913) and in October of the same year, Yuan Shih-kai was formally installed as President for a period of five years. A frontal clash, however, soon occurred between Yuan and the Nationalists over the question of a constitution with the result that the national assembly was dissolved and a new Advisory body of the President's nominees appointed to act in its stead after two years of absolute rule. Yuan went to the length of having a movement for a monarchical form of government launched with a view to having himself installed as emperor. In opposition to the monarchist movement, the Nationalists launched a third revolution in December of the fourth year of the Republic (1915) in Yunnan, and in June of the following year, Yuan died but not before he had cancelled his monarchical project, on April 25.

After the death of Yuan Shih-kai, Li

Digitized by Google

Yuan-hung was promoted from Vice-President to full President. As a system of responsible government through a cabinet had already been adopted, however, the real power fell into the hands of Tuan Chi-juei, the Premier. Feng Kuo-chang was designated Vice President and with the support of the Kuomintang, he strove for the restoration of the old provisional constitution and a national assembly, but was opposed by Tuan, who, with the support of the new political party called the Cheng-hsueh-hui, and held the Nationalists in check. The Nationalists soon, therefore, departed for the south and their influence gradually waned.

When the European War broke out, China also became involved. In March, 1917, the Republic severed its diplomatic relations with Germany, but over the question of the declaration of war Parliament disagreed with the government, and the various militarist factions supporting the Tuan Cabinet urged its dissolution. President Li Yuan-hung rejected the demand and discharged Tuan from his Premiership, thus bringing about a dangerous situation. The military governors (tuchun) established a provisional government in Tientsin, and with its backing, Chang Hsun, outstanding leader of the militarists at the time, pressed for the dissolution of Parliament. Under the circumstances, President Li could not refuse, and Chang Hsun, whose influence was thus increased, suddenly announced on July 1, the restoration of the Ching Emperor to the throne, and the political system being changed overnight President Li escaped to the Japanese barracks for shelter. Tuan Chi-juei, who had been living in Tientsin since his discharge by President Li, immediately organized an expedition against Chang Hsun and easily defeated him. The monarchist move thus failed. Feng Kuo-chang was now appointed President, and Tuan Chi-juei formed a cabinet for the second time, the proposed declaration of war against Germany being issued on August 14, 1917.

In spite of the services he rendered the Republic by crushing the monarchist move, the relations between Tuan Chi-juei and the Kuomintang failed to improve. The Nationalists continued their demand for the restoration of the national assembly but Tuan would not approve it. Meanwhile, the former members of the national assembly, encouraged by a circular telegram issued by Tang Chi-yao of Yunnan, proceeded to Canton from Shanghai and there supported Sun Yat-sen to become President of the new military government organised in September, 1917, by the Nationalists. Thus, the opposition between the northerners and the southerners became intensified.

Tuan Chi-juei planned to suppress the southerners by armed force but his plan was frustrated by acting President Feng Kuo-chang secretly communicating with the southerners. As a result, the Tuan Cabinet collapsed, but in the absence of any person capable of settling the chaotic situation at the time, Tuan became Prime Minister for the third time, in the seventh year of the Republic (1918). This time he promulgated new ordinances and convened a new national assembly which elected Hsu Shih-chang as President. Subsequently, Tuan resigned of his own accord but his Anfu faction continued its remarkable activity in the political world in the north.

On the other hand, Lu Jung-ting of the Kwangsi faction joined the military government in Canton, which resulted in a reorganization of the government with Sun Yat-sen retiring in favour of Chen Chun-hsuan of the Kwangsi faction as the political superviser. This change brought about a situation favourable for the peace-advocating policy of President Hsu Shin-chang and under the influence of the atmosphere created by the termination of the Great European War, a peace conference of the northerners and southerners was called in Shanghai during 1919. No agreement was reached at the parley, however, and the conditions in the north and south remained most chaotic. Internal dissension of the southerners continued, with Sun Yat-sen and his associates being driven away from Canton by the Kwangsi faction.

In March, 1920, the opposition between the Chihli and Anfu factions came to the surface with the result that Tuan Chi-juei, leader of the Anfu group, organized an expedition against the Chihli group headed by Tsao Kun who had among his lieutenants Wu Pei-fu. Chang Tsuo-lin, the then governor of the Three Eastern Provinces, sent his troops across the Great Wall to assist the Chihli forces. The Anfu troops were defeated and Tuan Chi-juei retired from active service.

The militarists in the south were also fighting among themselves with the result that the Kwangsi faction was expelled from Canton and Sun Yat-sen and his associates returned. The military government there was reorganized

Digitized by Google

and the old national assembly was convened in Canton in April, 1921, when the general principles for the organization of the National Government were decided and Sun Yat-sen was elected formal President of the Chinese Republic.

The Nationalists led by Sun Yat-sen soon placed Kwangsi under their control, but their influence, confined as it still was within the bounds of the two provinces of Kwangtung and Kwangsi, could not affect the general situation in China. On the other hand, the Fengtien (Mukden) faction in the north rapidly increased its influence after the defeat of the Anfu faction but the antagonism between the Chihli group and the Anfu group had been eliminated only to be replaced by the rivalry between the Chihli group and the Fengtien clique. About that time, many local militarists declared their independence and the organization of a sort of Federation of Provinces of China after the model of the United States of America in order to realize the national unity of the Chinese Republic was advocated.

In April, 1922, the Chihli and Fengtien factions came into armed conflict. The Fengtienites were defeated and Chang Tsuo-lin retired to the Three Eastern Provinces while the Chihli faction, elated over the victory and with Wu Pei-fu as its leader, commenced working for a compromise with the southerners. A circular telegram was issued announcing an accord between the north and the south and Hsu Shih-chang was reinstated as President. In the following year, Tsao Kun drove President Hsu out of office and realized his ambition to become President by bribing members of the national assembly.

Prior to this, Sun Yat-sen as President of the southern government undertook to achieve national unity by dispatching a punitive expedition against the northerners. The expeditionary forces advanced as far as Kwangsi in the latter part of 1921, but in November Sun Yat-sen had to escape to Shanghai becuase Chen Chiung-ming, military leader at Canton, rose in revolt against him. While Sun was planning a rally, the Soviet diplomat Joffe arrived in the East and held an interview with Sun in Shanghai during January, 1922. Their conversation resulted in an agreement whereby the Soviet would assist in the accomplishment of the Chinese Revolution and the Chinese Communist Party would cooperate with the Kuomintang. In the same month the Kuomintang was reformed and Sun was invited to Canton to assume the post of generalissimo.

When Tsao Kun bribed members of the national assembly for the realization of his ambition to become president Chang Tsuo-lin of Mukden, Lu Yung-hsiang of Chekiang and the Kwangtung government formed a tripartite alliance against the Chihli faction. In September, 1924 Wu Pei-fu caused Chi Hsieh-yuan to lead an expedition against Lu Yung-hsiang, but before the expedition could be completed, the second war between the Chihli and Fengtien factions broke out and the former had to fight with desperation because the latter was assisted by the Kwangtung faction in the south. In October, Feng Yu-hsiang, who was then commander of the third army of the Chihli forces, suddenly appeared with his army in Peking and demanded peace. Wu Pei-fu fell from power, and following up his success, Feng imprisoned President Tsao Kun and caused the Emperor Hsuan Tung to seek refuge because of his non-recognition of the agreement on courteous treatment of the old Imperial family. Tuan Chi-juei returned to power and assumed the post of Regent ad interim.

Expedition to the North As the generalissimo with headquarters in Canton, Sun Yat-sen ordered a punitive expedition to the north in the thirteenth year of the Republic (1924) with Tan Yen-kai designated as commander-in-chief but as the political situation changed as a result of the coup effected by Feng Yu-hsiang, Sun Yat-sen was invited to Peking in November of the same year for a conference with the Northern leaders. There Sun fell ill and died in March of the following year. Meanwhile, the Fengtien faction, in the execution of a plan to advance to the Yangtze valley, clashed with the Five Provinces' Combined Forces under the command of Sun Chuan-fang and was defeated. Taking advantage of the situation thus created, Kuo Sung-ling stirred up trouble in Manchuria and acting in concert, Feng Yu-hsiang sent a circular telegram proclaiming an expedition against Chang Tsuo-lin. The affair proved a failure for Feng because Wu Pei-fu, who was at Hankow at that time, took action in support of the Fengtien group. The Tuan regime collapsed and Chang Tsuo-lin appeared in Peking again to organize a transitional government with Tu Hsi-kuei as acting regent. When the Nationalist expedition to the north progressed, Chang

Digitized by Google

assumed the post of commander-in-chief of the Ankuochun or national pacification forces and finally realized his ambition to become generalissimo, in June, 1927.

After the death of Sun Yat-sen, the Kuomintang made a new start. For some time Hu Han-min acted as the generalissimo and in April, 1925, a National Government on the basis of the committee system was inaugurated with all relations with the Peking Government severed. In July of the following year, Chiang Kai-shek assumed the post of commander-in-chief of the revolutionary forces and the Nationalist expedition to the north was commenced. In October, the Nationalist forces occupied the Wuhan area and toward the end of the same year the Wuhan Government was brought into existence. The Communist Party was in its heyday then and its machination accounted for the recovery of the British concession in Hankow.

January of the sixteenth year of the Republic (1926) witnessed the gaining of control over the Shanghai-Nanking area by the revolutionary forces. The intensification of the dissension between the Kuomintang and the Communist Party led Chiang Kai-shek to remove the National Government to Nanking and to effect a coup against the Communists. When Wuhan and Nanking reached a compromise, Chiang resigned as commander-in-chief of the revolutionary forces and made a trip to Japan. Shortly afterwards, however, he returned to power and carried out the second stage of the expedition to the north to fight against the Chihli and Shantung armies. Feng Yu-hsiang and Yen Hsi-shan joined the Kuomintang about that time and Li Tsung-jen and Pai Chung-hsi, both of Kwangsi, also came forward to assist the revolutionary forces in fighting the Mukden troops.

The expedition steadily progressed favorably for the revolutionary forces until May, 1928, when a hitch occurred as a result of the Tsinan affair, in which they became involved with the Japanese at the time of the occupation of that city, the provincial capital of Shantung. In the meantime, the situation gradually became unfavourable for the Fengtien faction. Chang Tsuo-lin withdrew from Peking to return to Mukden, but on the way he met his death by the train on which he was travelling being blown up. Peking then fell into the hands of the revolutionary forces and was renamed Peiping while Chihli was renamed Hopei.

Chiang Kai-shek the President Upon the completion of the expedition to the north, Chiang Kai-shek became president of the National Government in October, 1928. Chang Hsueh-liang, heir and successor of Chang Tsuo-lin, joined the Kuomintang and the Three Eastern Provinces were placed under the control of the National Government, thus formally realizing the national unity of of the Chinese Republic.

In the eighteenth year of the Republic (1929,) the question of disbanding local troops gave rise to a dispute between the National Government and Feng Yu-hsiang who revolted against the Nanking regime. The revolt was soon suppressed but the internal troubles continued. When Wang Ching-wei, who had been staying abroad on account of his differences with Chiang Kai-shek, returned, he joined in creating a common front with Feng Yu-hsiang, Yen Hsi-shan and Li Tsung-jen against the National Government. Renewed civil war ensued and Chang Hsueh-liang dispatched his troops from Manchuria across the Great Wall into North China to assist the Nanking forces and help them to victory.

The foundation of the National Government thus became solidified and the influence of Chiang Kai-shek increased, but the internal dissension among the Nationalists could not be eliminated so easily. A clash in opinion occurred between Chiang Kai-shek and Hu Han-min over the question of a provisional constitution with the result that Hu, who was then president of the Legislative Yuan of the National Government and outstanding leader of the Kwangtung faction, was kept in confinement for some time and the Kwangtung faction severed its relations with the Nanking government. About that time, the Chinese Communist Party which had been weakened by the coup effected by Chiang Kai-shek gradually regained its influence with the aid of a red army organized in Kiangsi Province. This engaged the attention of Chiang, who finally undertook to suppress the red elements by starting an anti-Communist drive and proceeding to Nanchang to take personal command of the punitive forces.

After the outbreak of the Manchurian Incident of September 18, 1931, the Nanking government reached a compromise with the Kwangtung faction, whereby the National Government was reorganized with Chiang Kai-shek resigning in favour of Lin Sen as the President. Later, Chiang returned to power by assuming the chairmanship

Digitized by Google

of the newly created Military Affairs Committee and Wang Ching-wei resumed cooperation with Chiang by assuming the post of president of the Executive Yuan of the National Government. When the Manchurian Incident spread to Shanghai, the advocacy for an early accomplishment of the national unity gained ground and Chiang Kai-shek assumed the post of commander-in-chief of the air, land and sea forces of the Chinese Republic, thus greatly increasing his influence.

The Japanese campaign in Jehol was followed by a conflict between the Japanese and Chinese forces in North China in the 22nd year of the Republic (1933) which brought about a new situation in North China. Huang Fu was appointed chairman of the political affairs committee in Peiping and during the latter part of May an armistice terminating the hostilities within the Great Wall was concluded. Wang Ching-wei held the post of Foreign Minister at the time concurrently with his presidency of the Executive Yuan and took charge of the diplomatic dealings of the National Government with Japan.

During the latter part of 1933, Li Chi-shen of the Kwangsi faction, who had been kept in confinement for some time by Chiang Kai-shek, joined hands with the Leftist elements and established a popular government in Fukien Province by secretly communicating and conspiring with the Communist army. A rebellion broke out, but was immediately crushed by Chiang Kai-shek. The activity of the anti-Japanes elements caused trouble in North China in 1935 at a time which coincided with the launching of a movement for autonomy and defence against Communism by those friendly toward Japan. As a result, an anti-Communist autonomous government was established in East Hopei under the chairmanship of Yin Ju-keng.

Following the emergence of the East Hopei government, the Nanking authorities created a Hopei-Chahar political Council under the chairmanship of Sung Che-yuan. Prior to this, Wang Ching-wei was assaulted and injured by a ruffian in connection with his policy toward Japan and Chiang Kai-shek had succeeded him as head of the Executive Yuan. The Kwangtung faction, which had joined forces with the Nankingites after he outbreak of the Manchurian Incident, again took an uncompromising attitude toward the Chiang Kai-shek regime after its leader Hu Han-min suddenly died in May, 1936 and revolted with anti-Japanese slogans. Public opinion in the country, however, was against internal dissension at a time when the nation was face to face with a crisis, and this, causing a split in the Kwangtung faction, resulted in the revolt collapsing and Chen Chi-tang fleeing from Canton, in July.

In November of the 25th year of the Republic (1936), the Suiyuan affair occurred and hostilities were opened between the Inner Mongolian troops and the central army. While the war situation was developing favourably for the central army, Chiang Kai-shek, who was then visiting at Sian in Shensi Province, was kept in confinement by Chang Hsueh-liang and Yang Hu-cheng. The general situation in the country suddenly became threatening but the trouble was settled when Chiang was released. The compromise which was reached between Nanking and Sian in connection with the release of Chiang led to a great intensification of the anti-Japanese movement and the subsequent outbreak of the Lukouchiao affair on July 7th of the 26th year of the Republic (1937). The affair developed into the North China Incident which in turn developed into a sweeping armed conflict between the Chiang Kai-shek regime and Japan.

As a result of the Japanese advance to Nanking the Kuomintang Government issued an announcement on November 20, 1937, and removed the seat of government to Chungking, placing the military headquarters at Hankow which was again forced to remove to Chungking in October, 1938.

Industries

Agriculture

Only 17 per cent of the entire area of China is now under cultivation. Those engaged in farming, however, account for more than three-fourths of the entire population of the country and four-fifths of the national incomes are composed of receipts from agricultural enterprises. The agricultural community is composed of big landlords, medium landlords, independent farmers, tenant farmers and farming labourers. The tenant farmers accounted for 32 per cent of the emtire agricultural community during 1933, increasing from

Digitized by Google

28 per cent in 1912, while the percentage of independent farmers during the same period decreased from 49 per cent to 45 per cent.

The principal agricultural products with the amounts of production are shown in the following table (the figures being given in units of 1,000 piculs) :

	1931	1933	1935	1936
Rice	817,481	879,017	878,627	871,002
Wheat	432,360	450,562	426,052	461,555
Barley	158,552	148,295	158,112	162,748
Kaoliang	131,535	138,324	132,051	153,532

Mining

More than 1,000,000 tons of iron ore has been produced annually with Chinese capital, including about 380,000 tons at Tayeh, about 70,0000 tons at Hsiangpishan, about 280,00 tons at Fanchang and about 200,000 tons at Tangtu. The annual output of coal has amounted to some 20,000,000 tons, 39 per cent of which has been produced with the aid of foreign capital, the rest being accounted for by Chinese capital. The production of antimony in China is about 70 per cent of the world's total. China is also a leading producer of tungsten, accounting for 42 per cent of the world's total production.

On account of insufficient facilities the production of steel is small, and considerable supplies, therefore, have to be obtained from abroad. The production of minerals is as follows:

PRODUCTION OF MINERALS

(In units of 1,000 tons)

	1931	1933	1935	1936
Coal	28,820	18,585	14,938	15,034
Iron ore	2,201	1,136	1,364	1,340

Tungsten ore	4	6	7	7
Manganese	61	10	—	—
Gold	(118,505)	(94,608)	—	—
Silver	(153,000)	(200,585)	—	—

(Note: The figures in ( ) are in units of tael. The production in Machuria is included. The underlined figures are based on the 1937 edition of the Chinese Year Book.)

Manufacturing Industry

Modern industry was introduced into China after the Opium War of 1840. As a means for self-advancement, the Ching dynasty tried to promote industrial enterprises of a military nature and established the Anking and Shanghai arsenals in 1862. These were followed by the Kiangnan dockyard and a few more similar institutions. After the Sino-Japanese War of 1894, Japan acquired the right to conduct industrial enterprises in the treaty ports of China and the various Powers began working for the acquisition of similar rights. In 1897, Germany having obtained mining concessions along the Kiaochow-Tsinan Railway, intensified competition among the Powers in making investments in China resulted. Under the circumstances, the Chinese bureaucrats and landlords became interested in industrial investments and modern industry entered upon an important stage.

The outbreak of the Great European War in 1914 brought about a situation favourable for a rapid development of industry in China. As the war progressed, foreign capital, with the exception of Japanese, became less active, and gave the Chinese financiers a good opportunity to further the industrial development of their country. This situation, however, did not last very long as boom conditions disappeared with the termination of the war, and the various Powers renewed their efforts for supremacy. Such was the position until 1932 when the Chinese found themselves confronted with both a national and an industrial crisis.

In the light industries, Japanese and British capitals were definitely dominant. During the period from 1919 to 1935, the number of the spindles in the Japanese spinning mills in China increased seven times while those in the Chinese mills increased only three times. The number of weaving machines in the Chinese mills, too, increased by only

Digitized by Google

slightly over three times against an increase by fifteen times in the Japanese mills. Detailed figures for the spinning and weaving industry, as given in the 1936 edition of the Year Book compiled by the Shen Pao, are tabulated below:

	1933	1934	1935	1936
Number of mills	133	136	143	143
Number of spindles	5,019,917	5,171,600	5,381,688	5,526,847
Number of weaving machines	39,564	42,834	47,064	52,009
Amount of cotton yarn produced	2,332,684 (bales)	2,272,834 (bales)	2,288,357 (bales)	2,025,489 (bales)
Amount of cotton cloth produced	20,121,900 (rolls)	23,465,437 (rolls)	999,323,134 (thousand square yards)	1,036,575 (thousand square yards)
Amount of raw cotton used	8,706,019 (piculs)	8,955,767 (piculs)	8,892,633 (piculs)	8,768,161 (piculs)
Number of workers	—	—	—	207,899

As a result of the hostilities of 1937 in connection with the China Incident, eight spinning mills under Chinese management were totally destroyed in Shanghai and five others partially destroyed.

The woollen textile industry in China has a history of 50 years but its development has been very slow. According to a survey made at the beginning of 1937, there were 39 mills, with a total capital of 5,069,770 yuan and 2,655 hp., engaged in the woollen textile industry in the country.

With reference to the manufacture of matches, the Chinese displayed considerable activity for a time but at present Japanese capital dominates the industry. No more than 40 per cent of the production of tobacco in China is accounted for by the Chinese; while the salt refining industry has been unable to achieve any remarkable development on account of the restrictions of the Finance Ministry of the National Government.

Prior to the outbreak of the China Incident, the conditions of the flour manufacturing enterprises in China were quite satisfactory. The total capital of the Chinese flour mills in 1935 amounted to 26,900,000 yuan, while the amount of flour produced during the one year ending in July, 1936, reached 61,941,612 bales. The control of the flour manufacturing enterprises in Hopei and Shantung Provinces has, however, since the outbreak of the Incident, fallen into the hands of Japanese capitalists.

The conditions of the machinery industry in China are not satisfactory when viewed from the standpoint of Chinese management. There have been more than 560 factories throughout the the country but their total capital has never exceeded 6,000,000 yuan, and the work they have done has been limited to repairs or manufacture of parts. Almost all necessary machines have been imported from foreign countries, imports of this kind during 1937 amounting to approximately 6,500,000 yuan, the principal items of which were connected chiefly with the expansion of spinning mills under the management of foreign capital and construction work undertaken on the strength of the refunding of the Boxer Indemnity.

The chemical industry in China is still in its infancy. The number of establishments engaged in the industry which have each a capital of more than 100,000 yuan is only 17, made up of five salt factories and twelve acid factories. Only two establishments are capitalized at more than 1,000,000 yuan each. The alcohol manufacturing enterprises in the country have a history of only five or six years but their conditions are comparatively satisfactory.

The following is a list showing the index number of production of the principal industries in China during the past few years:

INDEX NUMBER OF PRINCIPAL INDUSTRIAL PRODUCTS

(Base, 1931=100)

	1932	1933	1934	1935
Cotton Yarn	103.9	93.4	105.9	100.7
Tobacco	114.6	106.9	93.9	99.2
Wheat Flour	66.0	109.4	101.3	89.3
Matches	96.8	100.4	103.0	96.7
Cement	96.8	100.4	103.0	96.7
Beer	—	87.0	105.0	101.1
Alcohol	—	—	—	100.0
General Index	99.5	97.2	100.7	102.1

Accurate statistics for the factory workers in China are still unavailable. According to a survey conducted by the

Digitized by Google

National Council of Industrial Associations during 1927, there were more than 2,680,000 factory workers and more than 11,000,000 persons engaged in handiwork during that year. The returns of the survey conducted by the Central Factory Inspection Office at Nanking on the basis of the revised factory law, show that there was a total of 6,344 factories in the various provinces and cities during the first half of 1935, employing a total of 521,215 workers. The number of railway workers was given as 61,545 persons by the Railways Ministry of the National Government, while the Communications Ministry gave the number of workers engaged in the postal service as 26,639 and 23,355 telegraph workers.

The following is a list giving the number of labour unions and their members on the basis of reports received by the International Labour Office:

	Number of Labour Unions	Number of Members
1932	647	411,329
1933	695	422,730
1934	759	462,742
1935	823	469,240

Transportation and Communications

Railways Railway construction in China was started in 1863 but it did not progress rapidly until after 1890. According to a survey compiled at the end of June, 1936, the total length of the state, provincial and private railways in the country was about 10,000 kilometres. The number of state lines was 16, the principal being as follows:

Peking-Hankow Line
Peking-Mukden Line
Tientsin-Pukow Line
Shanghai-Nanking Line
Soochow-Chiahsing Line
Shanghai-Hangchow-Ningpo Line
Peking-Suiyuan Line
Chengtai or Shansi (Shihchiachwang-Taiyuan) Line
Lunghai (Haichow-Tungkwan) Line
Canton-Kowloon Line
Shantung (Tsingtao-Tsinan) Line
Nanchang-Kiukiang Line
Canton-Hankow Line

The railway loans outstanding at the end of June, 1936, amounted to 1,441,637,538 yuan, about 90 per cent of which was accounted for by foreign loans. In other words, every one kilometre of the state railways in China then was under the obligation to redeem a foreign loan amounting to more than 144,000 yuan. The biggest creditor in connection with the railway loans was Great Britain, followed by France and Germany.

Road Road construction has become quite active during the last four or five years. The total length of motor-roads, which was only some 1,000 kilometres in 1921 and a little more than 66,000 kilometres in 1931, reached 109,749 kilometres at the end of 1936. The construction of public highways, which used to be associated chiefly with military operations in connection with civil disturbances and the anti-Communist-bandit drives, has also shown remarkable progress in recent years in line with the general construction programme.

Aviation Aviation in China has a history of only eight or nine years and almost all the activities in this field have been conducted with American and German capital.

The China National Aviation Corporation was brought into existence with a capital of 10,000,000 yuan in 1929 by American capital and technique. The air routes under the management of the corporation at the end of 1936 covered a total distance of 5,595 kilometres including the Shanghai-Chengtu line (2,023 kilometres), the Shanghai-Peking line (1,235 kilometres), the Shanghai-Canton line (1,543 kilometres) and the Chungking-Kunming line (780 kilometres).

The Eurasia Aviation Corporation was established in 1931 with a capital of 7,200,000 yuan, of which 2,500,000 yuan was paid by Germany. Up to 1935, the corporation had inaugurated air services covering a total distance of 6,560 kilometres including the Shanghai-Lanchow line (1,860 kilometres), the Peking-Canton line (2,050 kilometres), the Peking-Lanchow line (1,350 kilometres) and the Sian-Kunming line (1,300 kilometres).

The Southwest Aviation Corporation was established by the Kwangtung Provincial Government in 1934 and was placed under the control of the National Government in 1936 after the settlement of the Southwestern Affair involving a campaign launched by the Southwesterners against the Chiang Kai-shek faction. The air services under the management of this body include the Canton-Hanoi line (the northern line linking the two points via Lungchow, a distance of 838 kilometres, and the southern line connecting the two points via Kwangchowwan, a distance of 1,010 kilometres), the Canton-Nanning line (777 kilometres) and the Canton-Kiung-

Digitized by Google

cow line (505 kilometres).

Besides, an aviation corporation was established in North China during November, 1936, in accordance with an agreement reached between Japan and the then Hopei-Chahar Political Council, to take charge of the air services linking North China to Manchoukuo.

Telegraphic Communication At the end of 1936, there were a total number of 1,404 telegraph offices operating a total length of 102,346.1 kilometres of telegraph lines throughout the country. The number of radio stations was 65. The development of the wireless telegraph in the country during the period from 1931 to 1936 is shown in the following table:

	Number of Radio Stations	Number of Transmitting Apparatuses	Number of Receiving Apparatuses
1931	32	73	101
1932	38	89	120
1933	39	99	123
1934	47	117	154
1935	60	143	207
1936	65	173	260

The international telegraphic systems of China are in the hands of the British-managed Eastern Extension Australia and China Company, the Danish-managed Great Northern Telegraph Company (actual control being in British hands) and the American-managed Commercial Pacific Cable Company. Between Japan and China there are cables either owned by the Japanese Government or under joint Sino-Japanese management.

The following is a list classifying the various telegraphic services in China according to management or control:

Points Connected By Telegraphic Services	Managed By
Tsingtao-Sasebo	Japan and China jointly
Shanghai-Hongkong	G. N. T. C.
Shanghai-Nagasaki	„
Shanghai-Hongkong	E. E. A. C. C.
Shanghai-Manila	C. P. C. C.
Shanghai-Nagasaki	Japan
Foochow-Tamsui	„

Shipping The shipping business in China has been almost completely under the control of foreign shipping interests. The greater part of the foreign trade of China has been conducted by foreign vessels and even in the inland river shipping, foreign interests have been dominant over Chinese shipping interests. The volume of shipping, which was 145,000,000 tons for 1935, suddenly decreased to 90,000,000 tons in 1937 on account of the military operations and stoppage of shipping in connection with the China Affair.

The movements of shipping during 1937 together with the activities of Chinese, British and Japanese vessels are shown in the following tables:

1. Movements of Shipping in China (1937)

	Foreign Shipping	Chinese Shipping	Total
Number of arrivals and departures	58,006	133,393	191,399
Tonnage	64,449,000	25,588,738	90,037,738
Percentage of tonnage	72.25	27.75	100.00

2. Arrivals & Departures of Chinese British & Japanese Shipping (1937)

	International Routes	Chinese National Routes	Total
Chinese shipping (excluding junks)	8.30%	4.15%	23.98%
British shipping	36.51	43.43	40.10
Japanese shipping	19.18	11.02	14.23

Among the foreign shipping interests which hold dominant positions in China are Messrs Butterfield and Swire, Messrs. Jardine, Matheson and Company, the Nisshin Kisen Kaisha, the Dairen Kisen Kaisha and the Standard Oil Company.

According to a survey conducted in May, 1935, there were then a total of 20 foreign firms interested in the shipping business in China, operating 199 vessels of a total of 457,337 tons. The number of Chinese shipping companies each having no less than 5,000 tons of ships was 46 which operated 228 ships of a total of 350,961 tons. Of the foreign firms, 6 were Japanese which operated 59 vessels of a total of 141,004 tons against 124 vessels of a total of 305,100 tons for 10 British firms.

The settled accounts for the fiscal year of the 23rd year of the Republic (1934-35), as reported by the Ministry of Finance headed by Finance Minister H. H. Kung of the National Government, are tabulated below:

1. Revenue

(In yuan)

Tax receipts	744,922,042.20
Customs duty	353,175,774.95
Salt gabelle	167,437,077.36
Consolidated taxes	104,566,384.64
Cigars and Cigarettes	68,133,649.60
Cotton cloth	15,633,721.46
Wheat flour	4,786,867.71
Matches	8,948,167.92
Cement	3,086,313.48
Snuff	3,977,664.46
Spirits and tobacco duty	11,484,844.06
Stamp duty	6,914,406.46
Mining tax	4,232,259.30
Exchange tax	139,763.71
Banking tax	1,613,539.06
Receipts from state property	2,270,595.96
Receipts from state enterprises	60,503,154.53
Administrative receipts of government	10,627,049.06
Net profits or government enterprises	1,281,060.00
Other receipts	20,676,133.07
Receipts in loans and advances	226,195,589.69
Brought forward from preceding year	59,589,332.69
Total	1,030,706,964.58

2. Expenditure

(In yuan)

Party expenses	6,420,863.57
Civil expenses	230,868,398.94
State Council	16,448,979.01
Ministry of Interior	5,395,405.61
Ministry of Foreign Affairs	8,703,246.32
Ministry of Finance	68,553,342.77
Ministry of Education	31,739,487.23
Ministry of Justice	3,727,229.72
Ministry of Industry	6,725,402.94
Ministry of Communications	6,553,691.63
Ministry of Mongolian and Tibetan Affairs	1,669,457.19
Construction fund	26,364,620.28
Capital funds for state undertakings	537,200.00
Subventions	55,488,072.42
Pacification and relief funds	1,557,205.47
Relief fund	700,000.00
Military expenses	387,855,936.31
Investments in banks	73,500,000.00
Loan Service	237,498,355.57
General Reserve	4,784,901.81
Brought forward from preceding year	89,778,508.47
Total	1,030,706,964.58

A review of the National Government's budgets for the five fiscal years beginning in 1930 shows that the principal items in the table of expenditure are military expenses and loan service funds while the amount set aside

Digitized by Google

for education and construction expenses is comparatively small. This fact is well illustrated by the following figures:

1. Military Expenses

(In one million yuan)

	Amount	Percentage to Total Expenditure
1930	312	40.2
1931	304	40.6
1932	321	45.9
1933	373	44.6
1934	384	41.2
1935	321	33.8
1936	322	33.7
1937	392	39.2

(Note: The underlined figures denote that some of the expenses were defrayed during the preceding fiscal year.)

2. Appropriations for Redemption of Loans & Payment of Indemnity

(In one million yuan)

	Amount	Percentage to Total Expenditure
1930	290	37.5
1931	270	36.1
1932	210	30.0
1933	244	29.2
1934	237	25.2
1935	274	29.6
1936	239	24.4
1937	324	32.4

3. Education & Construction Expenses

(In one million yuan)

	Amount	Percentage to Total Expenditure
1933	24	2.8
1934	58	6.2
1935	73	7.6
1936	97	9.7
1937	112	11.2

Most of the revenue comes from customs duties, the salt gabelle and consolidated taxes. The customs duty accounted for 36.9 per cent of the total revenue during the 1937-38 fiscal year (in the 1928-29 fiscal year it was as high as 65.9 per cent) while the salt gabelle accounted for 22.9 per cent and the consolidated taxes, 17.5 per cent. Detailed figures are tabulated below:

PRINCIPAL SOURCES OF INCOME

(In one million yuan)

	Customs Duty	Salt Gabelle	Consolidated Taxes	Total
1929	245	85	39	369
1930	294	130	40	462
1931	389	115	74	618
1932	312	145	83	540
1933	340	159	89	588
1934	335	176	113	624
1935	316	184	116	616
1936	324	205	(132)	—
1937	342	(228)	(175)	—

(Note: The parenthesized figures in the above table are based on the budget estimates of the National Government.)

Banking

The modern-type banking business in China may be said to have commenced in 1900 when the country began to import foreign goods in large quantities. The modern-type banks thus appearing in the country are divided into two categories, i. e. foreign establishments and the Chinese institutions. The increases, 157, and decreases, 156, in the number of Chinese commercial banks during the period from 1912 to 1936 show a net gain of one.

For a long time, the old-fashioned credit associations of China exercised a great influence upon banking circles but, after the panic of 1932, many credit associations went into bankruptcy, while some others were reorganized into modern-type banks. Since the monetary system in the country was unified and a large number of branches of the modern-type banks have commenced operating in the interior, the time honoured associations have been losing their influence. The number of credit associations in the various provinces and their paid-up capital are said to be as follows:

	Number of Credit Associations	Total Amount of Paid-up Capital (Unit: 1,000 yuan)
Kiangsu Province	188	29,947
Chekiang ,,	269	7,563
Shansi ,,	39	1,587
Shantung ,,	75	2,292
Honan ,,	25	2,610
Shensi ,,	6	155
Hopei ,,	99	6,718
Szechwan ,,	53	4,061

Digitized by Google

		Number of Credit Associations	Total Amount of Paid-up Capital (Unit 1,000 yuan)
Anhwei	,,	17	445
Kiangsi	,,	73	2,132
Hupei	,,	55	2,824
Hunan	,,	59	1,102
Fukien	,,	85	5,955
Kwangtung	,,	174	8,115
Suiyuan	,,	20	1,376
Total		1,217	76,904

According to the latest available figures, the number of Chinese banks with deposits departments is 28, the total deposits being as below:

	Total Deposits with 28 Banks (In yuan)
1921	13,221,332
1931	206,668,240
1932	246,117,664
1936	456,222,902

Monetary System

The year 1935 deserves special mention as the year which witnessed China going off the silver standard and adopting the controlled currency system on the basis of foreign exchange. The drastic reform was necessitated by the rapid soaring of the price of silver and the violent rise of the exchange rates of the Chinese currency. The new monetary system was established with the support of the banking capital of Great Britain, while the monetary agreement concluded with the United States contributed much toward the maintenance and operation of the system.

After the outbreak of the China Affair in July, 1937, and even after the fall of Nanking, capital of the National Government, into the hands of Japanese forces, the Chinese monetary system continued to be strongly upheld, contrary to expectations. Among the factors accountable for the continuance of the monetary system were the support extended to the National Government by Great Britain and others and the exchange stabilization funds which the National Government were able to create with the large quantities of silver it obtained from various quarters in the country and shipped abroad.

Emergence of the Provisional Government of the Chinese Republic in North China and the establishment of the Federal Reserve Bank, also in North China, as well as the inauguration of the Renovation Government of the Chinese Republic in Central China, however, rendered it inevitable for the National Government to modify its exchange policy. Under date of March 13th, 1938, the National Government issued a notice announcing that the sales of exchange by the Central Bank in Shanghai would be discontinued and that the Central Bank in Hankow and its branch in Hongkong would conduct such sales instead. This change brought about a week tone in the exchange market in Shanghai, but a collapse was prevented by the deflation arising from the shortage of the old legal tender and the allotment of foreign currencies. Under the circumstances, the Central Bank changed its original scheme and opened an office in Shanghai to receive exchange purchase offers for transmission to the head office in Hankow.

With the nationalization of silver in November 3, 1935, the note issue, which had been in many banks' hands, became the prerogative of the three Government Banks, but the Farmers' Bank was exempted for the time being because of its connections in the interior, where the Government Banks did not function.

The following is a table showing the amount of notes issued by the Central Bank, the Bank of China, the Bank of Communications and the Farmers' Bank of China, demonstrating the growth with the withdrawal of private issues. (The figures are given in units of 1,000 yuan):

	Central Bank	Bank of China	Bank of Communications	Farmers' Bank	Total
End of December, 1935	176,065	286,245	176,244	29,847	668,402
End of December, 1936	325,592	459,310	295,045	162,014	1,241,952
End of December, 1937	430,608	606,548	371,144	230,798	1,639,098
End of January, 1938	432,244	623,324	372,927	244,142	1,677,637
End of February, 1938	441,650	632,986	361,143	261,409	1,777,188
End of March 1938	444,354	654,188	319,013	261,632	1,679,187

The reserves of the aforementioned four banks against note-issues were estimated at the end of February, 1938, to be as follows:

Digitized by Google

	Coins & Gold and Silver Bars	Bonds
Central Bank	285,502,000 yuan	156,148,000 yuan
Bank of China	406,340,000	226,646,000
Bank of Communications	216,808,000	144,334,000
Farmers' Bank of China	175,284,000	86,125,000

National Defence

For a number of years, the National Government under the leadership of General Chiang Kai-shek was engaged on large-scale warlike preparations with a hostile eye upon Japan, and this finally led to the outbreak of the China Incident. A review of the conditions of the military operations in connection with the incident shows that although the Chinese troops displayed considerable powers of resistance in some regions, their general standard was low. The lack of unity and discipline and imperfect equipment betrayed the nature of the Chinese troops as semi-feudal bodies. The backwardness of China is reflected in the fact that the National Government, in carrying on its military operations of resistance against Japan, must look to foreign countries for the supply of almost all the arms needed.

There is a point which cannot be overlooked in the consideration of the Chinese troops and that is that the Chinese troops have of late come to be political-minded as a result of the racial movement. The conditions of the Chinese troops in the early stages of the China Affair were as shown in the following lists:

	Commander	Affiliation	Location of Headquarters
First Route	Chen Tiao-yuan	Chiang Kai-shek faction	
Second Route	Liu Chih	,,	Kaifeng
Third Route	Han Fu-chu	Shantung army	Tsinan
Fourth Route	Liu Chien-hsu	Hunan army	Chuhsien (Chekiang)
Eleventh Route	Liu Mao-en	Liu Chenhua clique	Liuan (Anhwei)
Fifteenth Route	Ma Hung-kui	Ninghsia army	Ninghsia
Sixteenth Route	Hsu Yuan-chuan	Formerly of Chang Tsung-chang clique	Wanhsien (Szechwan)
Twentieth Route	Chang Fang	Honan mixed army	Kiangsi
24th Route	Ma Lin	Mohammedan army	Chinghai
26th Route	Sun Lien-chung	Honan army	Chengting (Hopei)
27th Route	Feng Chin-tsai	Shensi army	Tali (Shensi)
Fourth Route Army	Yu Han-mou	Kwangtung army	Canton
Fifth Route Army	Li Tsung-jen	Kwangsi army	Kueilin
Sixth Route Army	Liu Shiang	Szechwan army	Chengtu

Foreign Relations

After the outbreak of the China Incident, originating in the Lukouchiao affair of July 7, 1937, the National Government instituted a great propaganda compaign and mobilized its diplomatic services in an attempt to gain the sympathy and assistance of third countries.

The first appeal of the National Government to the League of Nations was made on August 30th of the same year. On September 13th, the National Government invoked Articles 10, 11 and 17 of the League Covenant in making its second appeal to the Geneva institution. The League Council took up the appeal for discussion on September 16th and then referred the matter to a committee of 23 members, which held its first meeting on September 21st and resolved to invite Japan, China, U. S. A. and Germany to a conference. Japan and Germany declined the invitation but the United States consented to participate in the discussion as an observer.

On September 21st, the Chinese delegate presented a note to the League in connection with the bombing of Nanking by the Japanese air force. The committee of 23 members brought up the question on September 27th and on the basis of the information obtained

Digitized by Google

from the Chinese side, passed a resolution censuring Japan for the bombardment of the National Government's capital. The League Assembly unanimously adopted the resolution on the following day. Meeting again on October 1st, the committee of 23 members decided the composition and powers of a subcommittee of 12 members including representatives of Great Britain, China and the Soviet Union. The Chinese side presented another anti-Japanese resolution which, however, had to be modified at the subcommittee meeting, although the Chinese side prepared it only after it had given up its original intention of invoking the provisions of the League Covenant concerning sanctions against Japan.

The chairman of the subcommittee prepared a formula by way of revising the Chinese proposal and Great Britain presented an amendment to the chairman's formula. As neither of them could be agreed upon, the subcommittee decided to create a drafting committee of 6 members on October 4th. The following day witnessed the completion of the draft resolution which was referred to the committee of 23 members and then to the League Assembly. At the meeting of the Assembly which was held on October 6th, all approved the draft resolution except Siam and Poland which abstained from voting. The resolution thus passed contained the following five points:

1. The president of the Assembly shall be requested to take necessary steps in regard to the proposal for the convocation of a conference of those League members who are signatories to the Nine-Power Treaty.

2. The Assembly shall express moral support to China.

3. The Assembly shall recommend to the League nations that they refrain from taking such actions as would weaken the resisting power of China, thereby increasing the difficulties between Japan and China in the present dispute.

4. The Assembly shall recommend to the League nations that they consider the extent to which they shall assist China.

5. Although the Assembly has decided to close its session, the president shall be empowered to call a session of the Assembly any time at the request of the committee of 23 members.

Thus, it may be seen that the League of Nations, while expressing sympathy with China, avoided such words as could be construed as criticism of Japan and which might excite the Japanese people, so that the resolution which it adopted was merely a formal one. By doing so, the League virtually shifted the responsibility for dealing with the Sino-Japanese conflict on to the shoulders of the Nine-Power Treaty Conference which was convened later. The question of recognizing the annexation of Ethiopia by Italy incidentally showed more clearly than ever the inability of the League to help China.

In accordance with the resolution of the Assembly, the president requested the League nations which were signatories to the Nine-Power Treaty to meet in conference concerning the Sino-Japanese conflict. Apparently with a view to avoiding responsibility, both Great Britain and the United States induced Belgium to send out invitations to a proposed conference at Brussels. Although the United States is not a member of the League of Nations, it participated in the Brussels parley with readiness as it played the leading part in the conclusion of the Nine-Power Treaty. The Soviet Union also took part in the parley on the strength of its being a member of the League of Nations while both Japan and Germany refused to participate because they were no longer within the League structure.

The schedule to open the Brussels conference on October 30th was changed on account of the political change in Belgium and the meeting did not commence until November 3rd. When it started, the delegates of the various countries, including the Soviet Union but excluding China, decided that a special committee should be created, in accordance with the proposal presented by the United States, to examine the reply of Japan refusing to participate in the Nine-Power Treaty conference and to employ their good offices in facilitating efforts for a compromise between China and Japan. In this connection, it must be noticed that the Italian delegate emphasized that the best way to find a solution to the question at issue would be to request Japan and China to open direct negotiations.

On November 6th, the Nine-Power Treaty conference decided on another note addressed to Japan, urging peace between Japan and China. The Japanese Government, however, firmly maintained the stand that it had previously taken in its refusal to participate in the Brussels parley. The Chinese delegate then presented a proposal to en-

Digitized by Google

force economic sanctions against Japan, which met with instant opposition by the Italian delegate. The Italian delegate also opposed the joint proposal of Great Britain, France and the United States to issue a declaration holding that the action of Japan in China was in contravention of the Nine-Power Treaty and the Kellogg anti-war pact, Sweden announced its intention to abstain from voting on the ground of its lacking important interests in the Far East, and Norway and Denmark followed suit. Accordingly, the joint proposal was adopted with a vote of 14 to one.

An adjournment followed the issuance of the declaration. When the Japanese military operations in the Kiangnan area progressed, the Nine-Power Treaty conference resumed activity on November 22nd, but without anything being achieved, the meeting was brought to an end on November 24th when an adjournment for an indefinite period was declared.

Soviet-Chinese Non-aggression Treaty The negotiations between Nanking and Moscow which had been under way for some time for the conclusion of a non-aggression pact between China and the Soviet Union progressed rapidly along with the development of the situation in connection with the Sino-Japanese conflict and on August 29th, the authorities at Nanking and Moscow who had been maintaining secrecy about their negotiations announced that a Soviet-Chinese non-aggression pact had been concluded. Reports were current that in addition to the non-aggression pact, the National Government concluded a secret pact for mutual assistance with Moscow against Japan but no confirmation has been available. Whether there be such a secret pact or not, however, there has been increasing Soviet assistance to the National Government since the outbreak of the China Incident, including the supply of arms, ammunition, aviators and aircraft.

The Soviet Ambassador to China, Mr. Bogomoloff, who had meant to remain in Nanking until the last moment in the face of the steady advance of Japanese forces on the capital of the National Government, suddenly left Nanking for Moscow by air on September 28th. Upon his arrival at Moscow, he was dismissed from office and was succeeded by Mr. Orelsky who reached Hankow by air in December and has since been maintaining close connections with the Chiang Kai-shek administration. The National Government also issued an order to the Chinese Ambassador in Moscow. Mr. Chiang Ting-fa, during December, instructing him to come home. When the ambassador returned by way of the Indian Ocean during the early part of April, he was relieved of his duties and as his successor, General Yang Chieh, formerly assistant chief of the General Staff who had previously been dispatched to Moscow, was appointed Chinese Ambassador to the Soviet Union under date of May 11th.

Peace-making Efforts of the German Ambassador Under instructions from his home government, the German Ambassador to China, Mr. Oscar P. Trautmann, in the fall of 1937, made endeavours to pave the way for direct negotiations between the National Government and the Japanese Government for a solution of the Sino-Japanese conflict. The Chinese side, however, failed to seize the opportunity provided by the German envoy and the hostilities were continued. Details of the peace-making efforts of Germany were not revealed but in the course of the 72nd session of the Imperial Japanese Diet, on January 22, 1938, Foreign Minister Hirota stated that the Japanese Government presented the following four demands to the National Government:

1. China should abandon the pro-Communist and anti-Japanese policy and should cooperate in the anti-Communist policy of Japan and Manchoukuo.
2. Demilitarized zones should be created within necessary areas and special machineries should be established within the regions concerned.
3. An agreement on close economic collaboration should be concluded among the three nations of Japan, Manchoukuo and China.
4. China should pay necessary reparations to the Japanese Empire.

Lists of Diplomats The following are lists of the various foreign envoys in China and the Chinese envoys to the various foreign countries.

FOREIGN ENVOYS IN CHINA

	Name	Date of Arrival at Post
British Ambassador	Sir Archibald John Kerr Clark Kerr	Apr., 1938

Sino-Japanese Hostilities in 1937-39

The Manchurian Incident which broke out in 1931 would have terminated with the accomplishment of the Japanese campaign in Jehol during 1933 had it not been for the persistent provocations by Chinese troops on the border of the new independent state of Manchoukuo. As it was, the Sino-Japanese hostilities were extended to North China in May, 1933. The end of the hostilities was marked by the conclusion of the Tangku Agreement and in order to meet the requirements of the new situation thus brought about, the Executive Yuan of the National Government created a political readjustment committee under the chairmanship of the late Mr. Huang Fu. The relations between the new

Digitized by Google

Chinese organ in North China and the Japanese side, however, were none too satisfactory. To make matters worse, anti-Japanese terrorisms were frequently committed there by the machinations of the Kuomintang and various secret Chinese societies. The assassination of the presidents of two Chinese newspapers in Tientsin which had connections with the Japanese side, in May, 1935, finally led to the presentation of the Japanese demand for the abolition of the Kuomintang branch in North China and the withdrawal of the Chinese central army from Hopei Province. By way of settling the affair, the so-called Umetsu-Ho Agreement was concluded between the then commander of the Japanese garrison in North China and the Chinese War Minister General Ho Ying-chin who was in charge of the North China branch of the Military Affairs Committee at the time.

Consequently, prospects became brighter and it was loudly advocated that economic cooperation should be established among Japan, Manchoukuo and China. Failing to grasp the real significance of the advocacy, the Chinese side took a non-conciliatory attitude and the North China regime that had been dealing with the Japanese side was suddenly dissolved in August, 1935. In such a manner, the National Government increased its influence in North China and anti-Japanese machinations there were intensified. In the meantime, a movement for autonomy was launched by the Chinese farmers with the result that the East Hopei Anti-Communist Autonomous Government was established under the chairmanship of Mr. Yin Ju-keng within the demilitarized zone as stipulated by the Sino-Japanese truce for North China. Thereupon, the National Government created a Hopei-Chahar Political Council under the chairmanship of General Sung Cheyuan in December of the same year to conform to the new developments.

The situation failed to improve, however, because the Chinese side showed no sign of willingness to realize the necessary econoimc cooperation among the Japanese, Manchoukuo and Chinese peoples. The non-conciliatory attitude of the National Government towards Japan became more conspicuous after the Suiyuan affair, which occurred during the latter part of 1936, and the Sian affair. The negotiations under way between the Japanese and Chinese authorities for a solution of the Chengtu affair broke down and the anti-Japanese sentiment of the Chinese heightened throughout China. Under the conditions, the China Incident broke out.

Lukouchiao Incident On the night of July 7, 1937, a small group of Japanese soldiers was suddenly fired upon by Chinese troops while engaged in manoeuvers at Lukouchiao on the outskirts of Peking. Negotiations were opened immediately for a settlement of the affair but while the negotiations were still in progress, the Chinese troops at Lungwangmiao and other points again made provocations which led the Japanese forces in North China to commence operations against the Chinese. Lungwangmiao was occupied by the Japanese on July 8th and the Chinese troops at Lukouchiao were disarmed. The negotiations finally resulted in an agreement whereby the Chinese troops withdrew to the bank of the Yungting River. On July 9th, however, the Chinese troops advanced to Lungwangmiao in violation of the agreement, thus aggravating the situation again.

While maintaining a policy for preventing amplification of the affair, the Japanese Government viewed the situation with apprehension and announced on July 11th that reinforcements would be dispatched to North China. Meanwhile, the Chinese central army steadily advanced northwards and firing by the Chinese troops took place at intervals at various points. Under the circumstances, the then commander of the Japanese garrison in North China, General Kazuki, announced on July 20th that resolute actions would be taken to deal with the repeated Chinese provocations.

The first severe fighting after the outbreak of the Lukouchiao affair occurred on July 25th when Japanese forces retaliated against the Chinese troops which had fired upon Japanese soldiers repairing the military telephone line linking Tientsin to Peking, in the neighbourhood of the Langfang station. As a result of the occurrence, the Japanese commander sent an ultimatum to the Chinese authorities, demanding the withdrawal of the 37th division under the Command of General Feng Chih-an of the 29th Army from Peking by noon of July 28th. The Chinese firing at the Kwanganmen gate in Peking further stiffened the attitude of the Japanese military authorities, who finally ordered the air force, artillery and infantry into action with a view to driving away the entire 29th Army.

The situation in Tientsin became disquieting because the 38th division under the command of General Chang Tzu-

Digitized by Google

chung of the 29th Army concentrated in the neighbourhood of that city. The Japanese garrison enforced special precautions in the city on the night of July 28th when Chinese troops attacked the Japanese. On the following day, the Japanese forces began capturing the Chinese bases of operations in the city and by July 31st had gained complete control. In the meantime, the 37th division evacuated Peking.

On July 29th, the peace preservation corps in Tungchow, the seat of the East-Hopei Anti-Communist Autonomous Government, mutinied and massacred the local Japanese residents including the staff members of the Japanese special service mission there. After the massacre, the mutineers kidnapped Mr. Yin Ju-keng, chairman of the autonomous government, and advanced to the northeast but were soon suppressed by Japanese forces.

Following the escape of General Sung Che-yuan from Peking, peace preservation committees in Peking and Tientsin were inaugurated and Japanese forces entered the walled city of Peking on August 8th, thereby restoring peace and order in the Peking-Tientsin district.

Around Shanghai After the Lukouchiao affair, the anti-Japanese activities in Central and South China increased rapidly under the direction of the National Government with the result that the general Sino-Japanese situation became more and more threatening. The Chinese began establishing military facilities within the Shanghai demilitarized zone, a breach of the Sino-Japanese truce agreement an Shanghai. On August 9th, Lieutenant Oyama and another member of the Japanese Landing Party in Shanghai were assaulted and murdered on the Extension Road of the International Settlement by members of the local Chinese preservation corps. Again on August 13th, Chinese plainclothes agents and regular soldiers fired upon Japanese patrols near the headquarters of the landing party.

Thereupon, the Japanese Government modified its policy of restricting the field of hostilities and resolved upon suppressing the hostile intentions of the Chinese. The resolution was made at a special session of the Cabinet Council on August 14th and was immediately announced in a statement of the Government. The China Incident thus developed in real earnest.

On the same day, units of the Japanese naval air force carried out a bombardment of the Chinese aviation fields in Hangchow and Kwangte. The air force continued daily raids on the Chinese air bases in Nanking, Nanchang and soochow for the purpose of crippling the Chinese air force, besides operating in cooperation with the landing party for the control of the Shanghai area. The landing party started bombardment of the Chinese positions near the North Station on August 13th, establishing its defence works in the North Szechwan Road area.

The Imperial Japanese Diet opened a special session on September 4th to deliberate on measures to cope with the situation arising from the outbreak of the Sino-Japanese hostilities. The Imperial Rescript granted on the occasion of the opening of the session expressed regret at the fact that the Empire had been forced to take resolute action to punish the Chinese troops for their outrages and clarified the fact that the operation of the Imperial forces was aimed at the consolidation of peace in East Asia by urging the National Government to reconsider its attitude. An additional budget to finance the military operations and various related bills were presented to the special Diet session and approved.

Development of North China Fighting The 37th division of the 29th Army which evacuated the Peking region concentrated along the Peking-Hankow Railway line while the 38th division of the same army withdrew from the neighbourhood of Tientsin to proceed southwards along the Tientsin-Pukow Railway line. About that time, the Chinese troops including units of the Central Army were already rushing warlike preparations in and around Paoting on the Peking-Hankow Railway, Tsangchow on the Tientsin-Pukow Railway and Changchiakow (Kalgan) on the Peking-Suiyuan Railway, obviously with a view to encircling the Peking-Tientsin area. The Japanese forces started counter operations by first advancing from Peking on Nankow to repulse the Chinese troops which had entered the demilitarized area in violation of the Doihara-Chin Agreement.

Nankow, strategic point on the Great Wall, was occupied by the Japanese forces on August 12th. Three days later, the Japanese succeeded in capturing the natural stronghold of Pataling. Prior to this, the Japanese Kwantung Army commenced operations to assist its friends operating within the Great Wall. Units of the army marched from Jehol into Chahar and occu-

Digitized by Google

pied Changchiakow on August 27th with the result that the entire Chahar Province soon fell into the hands of the Japanese forces. In the meantime, the Inner Mongolian troops started action for the realization of their aspirations of autonomy and commenced operations against the agents of the National Government along the Peking-Suiyuan Railway line with the cooperation of the Japanese forces. Under the conditions, the Japanese forces in the north were divided into two groups, one advancing on Shansi Province and the other marching into Inner Mongolia.

In the Peking-Hankow Railway sector, military operations began making rapid progress on August 15th when the natural stronghold of Fangshan was captured by the Japanese forces. This was soon followed by the Chochow battle. The fall of Chochow into the hands of Japanese forces constituted a signal victory for the Japanese in the North China campaign. On September 24th, Paoting which virtually formed the general headquarters for the Chinese operating along the Peking-Hankow Railway line was taken by the Japanese. On the same day, Tsangchow which was the most important base of operations for the Chinese in the Tientsin-Pukow Railway sector was completely occupied by the Japanese forces.

Development of the Shanghai Fighting Japanese troops commenced landing in the neighbourhood of Lotienchen on the lower reaches of the Yangtze River and Woosung at the estuary of the Hwangpoo River on August 23rd to reinforce the Japanese marines who had been fighting against more than 10 times as many Chinese troops since August 13th. The operations then started progressing in steadily enlarged areas. The walled town of Paoshanhsien was captured by a unit of the Japanese forces on September 6th and connections between this unit and those occupying Lotienchen and Yuehpuchen were soon established. The connections between the Japanese units operating against the Chinese holding the "tochka" (pill-box) positions on the bank of the Hwangpoo River and in the neighbourhood of the Chuking Road and other Japanese units, however, were not established until September 13th on account of the stubborn resistance put up by the Chinese.

The Japanese gradually pressed the Chinese troops back towards the Municipal Government building, and the operations centred around the creeks where the Japanese advance was checked by the stubborn resistance put up by the strongly entrenched Chinese troops. On October 8th, General Iwané Matsui, supreme commander of the Japanese forces in the Shanghai area ordered a general offensive against the Chinese on October 23rd. Two days later, the Chinese troops started retreating, leaving their positions to be occupied by the Japanese who then advanced to Nanhsiang and the Soochow Creek sector.

On November 5th, large groups of Japanese soldiers landed on the northern bank of Hangchow Bay and immediately advanced on Sungkiang and Chekiang. As a result of this surprise landing, the Chinese carried out a general retreat from the Shanghai area and the city of Shanghai, together with Nantao, completely fell into the hands of the Japanese forces on November 12th.

Cleaning-up Operations in North China The Japanese forces operating in the Peking-Hankow Railway sector held a ceremony on entering into the walled town of Paoting on September 25th. On October 8th, Chengting also fell into the hands of the Japanese who launched a general offensive against Shihchiachwang on October 10th and succeeded in capturing the strategic point the same day. After occupying Shunte, the last important Chinese position in Hopei Province, on October 15th, the Japanese advanced into Honan Province and captured Changte on November 5th.

The Japanese forces operating in the Tientsin-Pukow Railway sector continued their advance, acting in concert with their friends in the Peking-Hankow Railway sector. On October 1st, they advanced to Shantung Province and captured Sangyuan. Their operations were soon extended to the Yellow River sector following the occupation of Techow, Chinese stronghold in the northeastern section of Shantung Province.

The various units of the Kwantung Army operating in the Peking-Suiyuan Railway sector took Tatung, the most important area in North Shansi, on September 13th. They then commenced operating to assist in the attack against Hsinkouchen, the natural stronghold which the Chinese troops meant to maintain at all costs as the first line of the defence of Taiyuan. In the face of the vigorous advance of the Japanese forces, however, the Chinese had to begin retreating on November 3rd, leaving numberless dead behind them. In the meantime, a Japanese unit captured Chinghsing, in the colliery

Digitized by Google

district, on October 13th and continued to attack Niangtzukwan on the border of Shansi Province. Niangtzukwan fell and the Japanese forces advance on Taiyuan from various directions, finally occupying the provincial capital on November 9th, which marked the accomplishment of the battles in North China and Inner Mongolia.

Occupation of Nanking & Hangchow The Japanese forces gained complete control of Greater Shanghai on December 12th when the operations for clearing Nantao of the remnants of the defeated Chinese troops were successfully concluded. The positions of the Chinese on the outskirts of the city fell easily and Chiating and Nanhsiang were soon taken by the Japanese. The fall of Soochow and Wuhsi followed and operations for the capture of Nanking, the then capital of the National Government, were commenced.

On December 2nd, Kiangyin, stronghold on the Yangtze River fell into the hands of the Japanese who then advanced to Chinkiang and Chuyung, occupying the famous aviation field in the latter place on December 5th. In the meantime, those Japanese units which had crossed the Taihu lake after capturing Soochow reached a point about 10 miles southeast of Nanking on December 5th. Another group of Japanese forces which had been marching westwards after the occupation of Kwangte completely occupied Wuhu on December 10th, thus threatening to cut the retreat of the Chinese troops in Nanking. On the same day, the offensive against the walled town of Nanking was launched and the entire capital fell into the hands of the Japanese three days later.

On December 17th, Prince Asaka as well as General Matsui, the then supreme commander of the Japanese forces in Central China, and Admiral Hasegawa, commander of the Japanese squadron operating in Chinese waters, took part in the triumphal entry of the walled town of Nanking. The offensive was launched on December 22nd against Hangchow which the Japanese forces captured without losing a single soldier.

The Chinese sustained enormous losses in the Nanking battle, leaving 53,874 dead behind them when they were routed. The booty taken by the Japanese included 108 heavy guns, 19 field and mountain guns, 79 trench-mortars, 37 anti-aircraft guns, 7 anti-aircraft machine-guns, 19 howitzers, 956 machine-guns, 136 automatic rifles, 9,334 rifles, 115 revolvers, 10 tanks, 6 airplanes, 36 automobiles, 77,850 hand-grenades, 8,216 rounds of ammunition for heavy guns, 1,026 rounds of ammunition for field and mountain guns and 62,572 rounds of ammunition for trench-mortars.

Hsuchow Battle The fall of Nanking marked the completion of the first stage of the China Incident. The Chinese troops, made up of 7 divisions of the Kwangsi army, 2 divisions of the Szechwan army and the troops under the command of Generals Yu Hsueh-chung, Pang Ping-hsun and Sung Che-yuan as well as the remnants of General Han Fu-chu's troops, and the Central Army then began to strengthen their positions along the Tientsin-Pukow Railway line and the Lunghai Railway line. The commencement of the Japanese preparations for the Hsuchow battle was marked by the occupation of Pengfou on February 2nd following the capture of Linhuikwan on the previous day.

In the process of the Japanese preparations for the Hsuchow battle, about 6 divisions under the command of General Tang En-po were lured into the eastern section of Shantung Province. Failing to perceive the real intentions of the Japanese forces, the Chinese concentrated as many as 30 divisions in the southern section of Shantung, while conducting with elation the propaganda of victory in the Taierhchwang sector.

A part of the Japanese forces advancing from the south was manœuvred for the capture of Yencheng in the northeastern section of the Kiangtung region and also of Founing. They then gained control of Haichow. On May 5th, the main body of the forces crossed the Huai River and advanced on Hsuchow by way of Suhsien. On the other hand, the Japanese units advancing northwards from the district west of the Tientsin-Pukow Railway line cut the road leading to the Hsuchow area in Mengcheng, Yungcheng and Haohsien. Continuing, they succeeded in cutting the last important line of Chinese communication, namely, the Lunghai line, in the neighbourhood of Tangshan on May 14th. Simultaneously, the connections between the Japanese forces in Central China and those marching southwards from North China were established. The Japanese units marching southwards from the neighbourhood of Chining in Shantung advanced to the Lanfeng sector by way of Tsaochow on May 13th, which marked the virtual completion of the Japanese encirclement of the Chinese positions in the Hsuchow area.

Digitized by Google

The air units of both the Japanese navy and army operated daily for the bombardment of the Chinese positions with the result that the Chinese troops, in spite of their numerical strength, soon became unsteady and dismayed. On May 19th, the Morozumi unit of the Japanese forces succeeded in occupying one corner of the walled town of Hsuchow, which was immediately followed by the penetration into the town by other Japanese units. The Chinese stronghold, the defence of which was characterized by the Chinese boasted Chiang Kai-shek line, thus fell into the hands of the Japanese, and on May 27th, the historic interview between General Count Hisaichi Terauchi, the supreme commander of the Japanese forces in North China, and General Shunroku Hata, the supreme cmmander of the Japanese forces in Central China who succeeded General Matsui during the early stages of the preparations for the Hsuchow battle, took place in the neighbourhood of the walled town of Hsuchow. On the same day, the Japanese War Minister and Navy Minister were granted an Imperial Message complimenting the forces on their success in capturing Hsuchow.

According to an announcement issued by the army section of the Imperial Headquarters on May 24th, the Chinese troops sustained a total of 240,000 killed and wounded at the least, with some 103,000 dead bodies being left on the battle-field. The Japanese forces captured 96 guns, 270 heavy machine-guns, 86 machine-guns, 2,031 freight cars and 8 armoured trains as well as large quantities of ammunition.

Following the Hsuchow battle, a part of the Japanese forces marched westwards, pressing hard on the fleeing Chinese troops. With the cooperation of the Japanese units crossing the Yellow River from the north, the Yasuda, Nasu and Yokoyama units occupied Lanfeng on May 24th and then captured Kweite on May 27th. The operations for the capture of Kaifeng, the provincial capital of Honan which formed the first line of the defence of the Wuhan area, followed. The general offensive was launched on June 4th and on the following day, the Chinese stronghold was in the hands of the Japanese forces.

The Japanese forces then proceeded to attack Chengchow, junction on the Peking-Hankow Railway and the Lunghai Railway. In the meantime, the Chinese troops breached the embankment of the Yellow River at more than 10 places in an attempt to check the Japanese advance, with the result that tens of thousands of Chinese homes were flooded. The rapid actions taken by the Japanese forces, however, prevented more serious consequences; the embankment was repaired and the Chinese flood sufferers were rescued and cared for.

Hankow Battle Some of the Japanese forces which had occupied Hofei (Luchow) on May 14th started advancing on June 6th in the direction of Anking, the provincial capital of Anhwei, which was taken by a combination of naval, army and air units of the Japanese forces. This was followed by the fall of Hukow and Kiuking. On the other hand, a number of Japanese army units captured Taihu on July 26th and then took Susung. Continuing, they crossed the provincial border into Hupei and captured Huangmei on August 2nd. Thus, the Japanese naval, army and air units steadily pressed on the Wuhan area from the north, northeast and east.

In the face of the steady Japanese advance, the National Government transferred its administrative organs from Hankow to Chunking and advised the local inhabitants to seek shelter at safer places, while rushing warlike preparations by strengthening the defence works in the area. The first line of the defence of the Wuhan area extended as far north as Kunghsien, with Hsuchang on the Peking-Hankow Railway line being made the centre. This line was left in charge of General Tang Enpo. The second line which had its centre at Sinyang traversed the Peking-Hankow Railway and was committed to the charge of General Sun Lien-chung. The third defence line formed a semicircle linking Wushengkwan on the Peking-Hankow Railway to the southern bank of the Yangtze River by way of Macheng, east of Hankow, and crack artillery units and mechanized units were posted along it. Two extra lines were established for the protection of the three main lines, one leading from Kushih to the Yangtze River in the south by way of Macheng and the other along the Tapieh mountain range. The northern extra line had its centre at Loyang and was placed under the command of General Cheng Chien while General Li Tsung-jen was appointed commander of the southern extra line with its centre located at Kushih. Still another section of the defence was created at Macheng with General Chang Fa-kuei appointed commander; this sec-

Digitized by Google

tion was primarily aimed at preventing Japanese advance from the bank of the Yangtze River.

Occupation of Canton When the battle for Hankow was in full swing, a campaign no less spectacular was started in South China by the Japanese Army in cooperation with the Navy. Crack units of the Japanese Army and Navy at dawn, October 12th, 1938, succeeded in making a surprise landing at Bias Bay in South China, and made a swift advance toward Canton. On October 15th they occupied Waichow, and on the 19th reached Tsengshing. At 3:30 October 21st, Japanese tank units entered Canton. General Yu Han-mou and other leaders of the Canton armies had fled from Canton before the Japanese entry, and the remnants of Chinese troops in Canton were routed by the Japanese forces on October 21st, 1938.

Fall of Hankow The Wuhan district comprising the three cities of Hankow, Hanyang and Wuchang fell on October 27th, 1938. After breaking through the Chinese positions on the Shih River and Mount Fukinshan, Japanese forces reached the Peking-Hankow railway on October 12th, 1938, thus completing a pincer movement against Hankow. The success of Japanese forces in South China served to confound the Chinese troops in defence of Hankow and all key points fell before the Japanese onslaughts one after another, while General Chiang Kai-shek who had declared to share the fate of Hankow was compelled to flee from the city.

After the fall of Hankow the Japanese forces in North and Central China engaged in clearing the banditry of the Chinese troops in the occupied areas.

Hainan Campaign Early in the morning of February 10th, 1939, crack units of the Japanese Army and Navy succeeded in effecting a surprise landing on Hainan Island, and the Island was soon completely occupied by the Japanese forces.

Activity of the Imperial Navy The Imperial Japanese Navy has displayed remarkable activity since the early stages of the China Incident, at times operating in close cooperation with army units and at other taking independent action. In the beginning, the navy concentrated its efforts on the prevention of amplification of the incident in line with the policy of the Imperial Government and the withdrawal of Japanese residents from various points in Central and South China where the anti-Japanese sentiment heightened with developments in North China. The assault and murder of Lieutenant Oyama of the Japanese Landing Party in Shanghai on August 9th, however, brought about a sudden change in the attitude of the navy and on August 13th, the Japanese marines commenced operations against the Chinese troops.

On August 14th, Chinese airplanes carried out a raid on Japanese warships, the headquarters of the Japanese Landing Party, the Japanese Consulate-General and also dropped bombs in the neighbourhood of the Cathay Hotel and other centres of the International Settlement, causing many casualties among civilians. With a view to crippling the Chinese air force, the navy ordered out an air squadron, which crossed the ocean in defiance of a stormy weather, to attack Hangchow and Kwangte. On the following day, the air squadron bombarded Nanchang, Nanking, Shanhsing, Hangchow, Chiahsing, Soochow, Chuyang and Yangchow, smashing 100 Chinese planes held ready for action on the ground, shooting down about 50 others in aerial warfare and destroying some Chinese aerodromes.

August 25th witnessed the issuance of a statement by Admiral Hasegawa, commander of the Japanese squadron operating in Chinese waters, announcing the blockade of the China coast from the estuary of the Yangtze River to Swatow. The scope of the blockade was enlarged on September 5th to the entire Chinese coast, except the leased territories of third nations and Tsingtao. The declaration of the enlargement was made jointly by Admiral Hasegawa and Admiral Yoshida, commander of the Japanese naval unit operating in South China.

Prior to this, Japanese warships effected the occupation of Tungsha Island. The naval operations for the stoppage of shipping were conducted in two divisions for some time but were later unified in command. A statement announcing the unification was issued on November 20th in the name of Admiral Hasegawa.

Many Chinese warships have been sunk by the Japanese navy, among them, to October 4th, were the cruisers Pinghai, Haichou, Yingjui and Chaoho, in addition to one cruiser of the 2,500-ton class and the gunboats Yat-sen (Ihsien), Tesheng, Yungsui and Yungsheng, the Chinese naval force thus being practically annihilated.

On May 10th, a Japanese naval unit landed on Amoy Island and, driving out the Chinese troops holding the pill-

Digitized by Google

box positions, captured the eastern end of the island. The unit carried on its drive against the Chinese, with the co-operation of air corps, until May 11th when the entire island was completely occupied. On the 20th of the same month, another Japanese naval unit attacked Lienyun port, terminus of the Lunghai Railway, occupying the port by effecting a landing in front of the enemy.

The Japanese naval air force sent a squadron of about 30 machines to conduct an aerial bombardment of the Chinese military establishments in Canton and vicinity on May 28th. Daily bombardments followed and the Chinese side appealed to third countries with the assertions that the Japanese air force had been bombing defenceless cities and causing casualties among civilians. The naval section of the Imperial Headquarters, however, contradicted the Chinese assertion by enumerating facts showing that Canton formed an important base of the Japanese military operations.

Under the protection of the navy, the Takahashi and Sato units advanced up the Yangtze River and landed at a point on the lower reaches of Anking on June 12th. The surprise attack forced the Chinese troops to retreat, leaving Anking to be occupied by the Japanese on the same night. Concerted actions of the army, naval and air units of the Japanese forces followed for the clearing of the river of mines and booms as well as for crushing the Chinese troops in their way, and on July 4th they succeeded in taking Hukow, strategic point on the upper reaches of the Yangtze River. Kiukiang was taken on July 26th, and Hankow was now menaced.

Chungking Attacked The Japanese naval air forces made successful raids on Chungking, seat of the Nationalist Government on May 3rd and 4th, and similar raids have been repeated in following months.

Summary of Japanese Military Gains and Losses On May 29, 1939, the Army section of the Imperial Headquarters made public the results of the Sino-Japanese hostilities from the outbreak of the China Affair in July, 1937, to the end of April, 1939.

The total area under Japanese occupation in China comprises the seven provinces of Chahar, Suiyuan, Hopeh, Shantung, Shansi, Kiangsu and Anhwei in their entirety, the greater part of Honan Province, wide areas in the four provinces of Chekiang, Kiangsi, Hupeh and Kwangtung and all of Hainan Island.

The Japanese occupied region in China covers an area of 1,562,938 square kilometres, about two-and-half times as large as Japan, the area of which is 675,365 square kilometres.

The proportion of the Japanese occupied area to China Proper, which has an area of 3,157,346 square kilometres, is 50 to 100, while the percentage of the Japanese occupied area to continental China (including the outlying provinces), which has an area of 10,059,877 square kilometres, is 16 to 100.

COMPARATIVE SINO-JAPANESE LOSSES

(Compiled at the end of April, 1939)

Fronts	Campaigns	Sectors	Period	Chinese Losses Bodies abandoned on battlefields	Japanese Losses Killed
(From July, 1937, until November, 1938)				823,296	47,133
North China	Haichow Campaign & Clean-up Campaign	Haichow Sector and Other Ports of North China	From December, 1938 to April, 1939	73,200	
Central China	Nanchang Campaign	Wuning and Nanchang Sector	March 19 to March 31	12,300	
	Lushan Campaign	Lushan Mountains	April 17 to April 24	920	
	Anlu Campaign & Clean-up Campaign in Other Parts of Central China	Yingcheng and Anlu Sector and Other Places	December, 1938 to April, 1939	17,822	12,865
South China,	Hainan Campaign, Others	Hainan Island & Other Places in South China	December, 1938 to April, 1939	8,807	
	Total			113,049	

Digitized by Google

The total losses from the outbreak of the China Affair up to April, 1939, were 936,345 Chinese soldiers killed and left on the battlefield as against 59,998 Japanese killed.

N.B. The results of the Japanese clean-up campaigns in various parts of China have not yet been fully reported. The above list, therefore, is incomplete. Conservative estimates of total Chinese casualties during the period under review may be placed at 2,300,000, including 936,345 bodies actually counted on the battlefields.

ARMS AND WAR MATERIALS CAPTURED BY THE JAPANESE UP TO THE END OF APRIL, 1939

	(From the Outbreak of the China Affair, July, 1937 to November, 1938)	(From December, 1938 to April, 1939)	Total

N.B. The above list is based on the exact figures which appeared in the reports received from the front; all intangible designations, such as "large quantities," are excluded from the list. The amount of ammunition captured by Japanese forces, therefore, may be considerably larger than that shown in the above list. Large quantities of medical supplies, carts, waggons, clothing and provisions, including rice and tobacco also have been captured from the Chinese armies, but this list is concerned only with major items of arms and ammunition. The gun shells mentioned above comprise all sorts of shells, including all heavy gun missiles, except those used for trench-mortars.

Naval Achievements Achievements of the Japanese Naval Air Force in China, as announced by the Navy section of the Imperial Headquarters on November 9, 1938, are tabulated below.

Operations by Japanese naval planes during the month of November, 1938 were extensive. Bombing expeditions were conducted in the provinces of Kiangsi, Hupeh, Szechuan, Hunan and Kwantung. The air field and military establishments at Ichang in Hupeh Province were bombed many times, while repeated visits were paid to Nanning in Kiangsi Province, Chungking, Liangshan and Chengtu in Szechuan Province, Hengyang in Hunan Province and various points along the Chekiang-Kiangsi and Canton-Hankow Railways. Chinese troop concentrations at Mienyang, 100 kilometres southwest of Hankow, were also attacked.

In Central China, the Japanese naval force continued its drive up the Yangtze during November, sweeping mines and removing booms. After re-opening the waterway at Shuikow, the naval force reached Sangchiashih, 12 miles above Yaowan, on November 5th. Paotachow was reached the following day.

Naval Achievements The Navy section of the Imperial Headquarters on May 31, 1939 announced the results of the Japanese naval operations between January 1st and May 31st, including the losses inflicted on the Chinese air force and the number of mines discovered and disposed of by the Japanese fleet.

(1) Chinese Losses in Aeroplanes: During the period under review, the Chinese air force lost 58 planes, includ-

Digitized by Google

ing eight which were not confirmed, bringing the total of Chinese losses since the outbreak of the current Affair to 1,561 planes, including 218, which have not yet been confirmed. The Japanese naval air force lost three planes in the period under review, making a total of 116 lost since the beginning of the China Affair.

(2) Chinese Mines Discovered and Disposed of: The Japanese fleet discovered and disposed of 536 mines in the Yangtze River, bringing the total number of mines discovered and disposed of since the outbreak of the Affair to 2,848, while 237 mines were discovered and disposed of in the Pearl River, making a total of 654 since the beginning of the hostilities. The grand total of mines discovered and disposed of since the inception of the China Affair is placed at 3,502.

Emergence of New Regimes

Provisional Government of the Chinese Republic

Along with the amplification of the Lukouchiao affair of July 7th, which finally developed into the China Affair, the Hopei-Chahar Political Council ceased to function, with the result that a state of anarchy began to prevail in North China. In order to cope with the situation, peace preservation committees were organized within the various areas occupied by the Japanese troops but as they could work only for the maintenance of peace and order in their respective localities, it was strongly urged that a new regime should be established to take charge of the administration of North China as a whole. Accordingly, the Provisional Government of the Chinese Republic was inaugurated at Peking on December 14, 1937, one day after the fall of Nanking, the capital of the National Government.

The Provisional Government is composed of three committees, namely, the Deliberative Committee, the Administrative Committee and the Judicial Committee. The general principles of the official organization of these organs are as follows:

1. Deliberative Committee:

Article 1—The deliberative committee shall be the highest deliberative organ of the Provisional Government.

Article 2—The committee shall have one chairman, five standing members and a number of members.

Article 3—The matters for deliberation shall include (1) administrative policy, (2) legislative bills, (3) budget estimates and settled accounts, (4) appointment of officials of Chienjen rank, (5) declaration of war, negotiation for peace and the conclusion of treaties and (6) other matters which are recognized as requiring the consideration of the said committee.

Article 4—The regulations governing the proceedings of the deliberative committee shall be determined separately.

Article 5—The committee shall have a secretariat.

2. Administrative Committee:

Article 1—The administrative committee shall be the highest administrative organ of the Provisional Government.

Article 2—The committee shall have one chairman and five members.

Article 3—The matters for consideration of the administrative committee shall include (1) legislative bills to be presented to the deliberative committee, (2) budget estimates and settled accounts related to the deliberative bills to be presented to the committee concerning declaration for peace and treaties, (4) amnesties, naturalizations and reinstatements, (5) matters concerning the powers of the organs under its jurisdiction and (6) other matters which are recognized as requiring the consideration of the said committee.

Article 4—The regulations governing the proceedings of the administrative committee shall be determined separately.

Article 5—The administrative committee shall have a secretariat and seven departments, namely, the administrative department, the department of the interior, the department of public peace, the department of education, the department of justice, the department of economics and the department of industry.

Article 6—The administrative committee may engage the service of advisers or counsellors with a view to achieving the best results in administration.

Article 7—The administrative committee may have investigators to inspect conditions of the administration of the various localities.

Article 8—The administrative committee may have auditors to audit budget accounts. The regulations governing auditing shall be determined separately.

3. Judicial Committee:

Digitized by Google

Article 1—The judicial committee shall be the highest judicial organ of the Provisional Government.

Article 2—The committee shall have one chairman and five members.

Article 3—The matters for the consideration of the judicial committee shall include (1) unification of the interpretation of laws and ordinances, (2) the change of judicial precedents, (3) such matters to be referred to the deliberative committee as are within its jurisdiction, (4) appointment and dismissal of officials of Chienjen rank of the organs under its jurisdiction and (5) other matters which are recognized as requiring consideration of the committee.

Article 4—The regulations governing the proceedings of the judicial committee shall be determined separately.

Article 5—The judicial committee shall have a secretariat, a supreme court, a court of administrative litigation and a committee on the disciplining of officials.

The Provisional Government announced the structures of its various organs under date of January 1, 1938. Three days later, it issued a decree that the old laws and ordinances would be applied for the time being so long as their provisions did not run counter to the purport of the manifesto issued by the Provisional Government.

Following is a list of the important staff members of the Provisional Government:

1. Deliberative Committee:
   Chairman: Tang Erh-ho
   Standing Members: Wang Ko-min, Chu Shen, Tung Kang, Wang I-tang, Chiang Chao-tsung, Kao Ling-wei, Chi Hsieh-yuan.
2. Administrative Committee:
   Chairman: Wang Ko-min
   Members: (Director of Administrative Department) Wang Ko-min
   (Director of Department of Interior)
   (Director of Public Peace Department) Chi Hsieh-yuan
   (Director of Department of Education) Tang Erh-ho
   (Director of Legislative Department) Chu Shen
   (Director of Relief Department) Wang I-tang
   (Assistant Director of Relief Department) Yao Kuo
   (Director of Department of Industry) Wang Yin-tai
   (Director of Central Construction Office) Yin Tung
   (Assistant Director of Central Construction Office) Li Hsuan-wei
3. Judicial Committee: Chairman, Tung Kang
4. Important Local Officials:
   Kao Ling-wei (Governor of Hopei), Su Ti-jen (Governor of Shansi), Ma Liang (Governor of Shantung), Hsiao Jui-chen (Acting-Governor of Honan).

Amalgamation of the East-Hopei Government The East-Hopei Anti-Communist Autonomous Government issued a statement at the time of the inauguration of the Provisional Government of the Chinese Republic, announcing that it would be willing to dissolve itself in appreciation of the fact that the policy of the new regime and its own proved to be one and the same, and would begin immediately to prepare for the dissolution. By way of putting the finishing touches to the preparations, Mr. Chih Tsung-mo, chief administrator of the East-Hopei Government, held an interview with Mr. Wang Ko-min, chairman of the administrative committee of the Provisional Government, on January 30th, when an agreement was reached between them to merge the East-Hopei into the Provisional Government on February 1st. Official notes embodying the agreement were exchanged between them and their contents were published the same day.

Under date of April 6th, the Provisional Government promulgated a set of regulations prohibiting crimes against the lives and property of individuals and the welfare and order of the community under the penalty of death. The legislation was intended for coping with the transition period, being prescribed to remain in force for three years only.

Education On March 25th, the Provisional Government decided the fundamental policy towards education and on the following day, instructions based on the policy were issued to the various educational institutions in the name of Education Minister Tang Erh-ho. The principal points of the instructions were as follow:

1. In the past, the educational policy as followed by the National Govern-

Digitized by Google

ment was to enhance the authority of the Kuomintang and stimulate antagonism against Japan. It is this policy that has led to the present incident. A strict control is, therefore, required in order to stop such pro-Kuomintang and anti-Japanese education in the future.

2. In the rehabilitation of schools, attention shall be paid in the first place to primary schools and later extended to secondary and higher schools. For the establishment of schools, permission of the Provisional Government shall be obtained and instructions of the Department of Education shall be sought.

3. In consideration of the fact that education is capable of making a great contribution towards the betterment of living, close relations with actual life should be maintained in enforcing this educational policy. In education at primary schools due attention shall be paid to the requirements of living as well as to hygiene.

4. Secondary schools shall, as a rule, be divided into two categories, one for male students and the other for female students. Otherwise they shall have separate classes for males and females. Until women's higher professional schools and women's universities are established, however, the general higher professional schools and universities may admit female students to study together with male students.

5. In the education of females, due considerations shall be given to their primary missions, bôth in society and the home, as distinct from those of males. Special stress shall be laid upon character building in their education.

6. All those schools managed by foreigners shall be properly controlled and directed so that they may follow the educational policy of the Provisional Government.

7. With reference to physical training in primary and secondary schools, the materials for instruction shall be arranged with due consideration to national arts as well as exercises.

8. Boy scouts shall be organized with a view to training in collective action and public service. Separate groups shall, as a rule, be formed for each town or village.

9. Teachers at primary and secondary schools shall be trained anew so that their mistaken conceptions, as manifested in the past, may be rectified.

Friendly Policy Towards Japan In response to the statement of the Japanese Government issued on January 16th announcing that no diplomatic dealings would be conducted with the Chiang Kai-shek regime in the future, the Provisional Government at Peking announced its determination to work for the relief of the masses of people suffering from the ravages of war and for the prevention of the spread of Communism with the co-operation of Japan. The Provisional Government made the announcement on January 27th by issuing a lengthy statement in which it enumerated various salient facts showing the blunders committed by the Kuomintang and the Chiang Kai-shek regime and in which it voiced its appreciation of the readiness of the Japanese Government to adjust its diplomatic relations with China by dealing with the Provisional Government. In the statement, the Provisional Government pledged itself to work for the reconstruction of the country, and thereby contribute towards the consolidation of peace in the Orient with the cooperation of the Japanese nation.

With a view to the protection of the Chinese residents in Japan as well as facilitating the conduct of dealings with the Japanese Government, the Provisional Government decided to create a branch office in Tokyo. The decision was carried out on April 10th when the Tokyo branch was inaugurated.

For the purpose of extending respect to the Japanese Government and people and at the same time holding important conversations with the leaders of the Japanese Government, Mr. Wang Ko-min, chairman of the administrative committee of the Provisional Government, arrived in Tokyo on May 1st, flying from Shanghai the same day. Upon arrival Mr. Wang issued a statement through the Japanese Foreign Office, which read in substance as follows:

"The distance between Japan and China has been so shortened that either may be reached from the other in a day, but it is a matter of regret that diplomatic relations between the two nations have been characterized by frequent untoward events culminating in the present unprecedented situation. Whether in power or out of it, I have been making efforts for the collaboration between the Japanese and Chinese peoples. Particularly, I have done my bit at one time as member of the Hopei-Chahar Political Council and at another time as member of the Political Readjustment Committee in North China after the influence of the Kuomintang was extended to that sector of the Chinese Republic. In connection with the present incident, it must be noted

Digitized by Google

that I urged peace from the very beginning. When the statesmen of the National Government plunged the people into distress, I found it difficult to remain indifferent and accordingly organized the Provisional Government of the Chinese Republic in Peking in cooperation with my kindred spirits with a view to the restoration of the situation to normalcy and the stabilization of the living of the people.

"I am happy to say that the organization of the Provisional Government has been perfected and the fundamental principles concerning a merger with the Renovation Government have also been decided. This time I have come to Japan with the object of thanking the Government and people of the country for the great assistance they extended to us in the formation of the Provisional Government. Stabilization of the situation in China is, in my opinion, a prerequisite for tranquillity in East Asia and it is essential that the Japanese and Chinese peoples should maintain close relations and supply each other's needs in the interest of East Asian peace. It is my earnest hope that the Government and people of Japan will continue to render great assistance to the Provisional Government in the future from the standpoint of the general situation in East Asia."

North China Customs The Provisional Government took over, on December 16th, 1937, the Maritime Customs in North China which had been under the control of the National Government. On the same day, Mr. Wang Ko-min, chairman of the administrative committee of the Provisional Government, issued the following statement:

"The present Government, which was established on December 14th on the basis of the collective will of the masses of the people, considers the administration of the Customs is important not only from the financial viewpoint but also from the vital and delicate relations it has with commerce and industry. It is impossible for the present Government to neglect any item of administrative affairs in order to promote the real happiness and welfare of the people, and any part of the organisation of the old regime, which was engrossed in causing international political troubles through its pro-Communist and anti-Japanese policy in disregard of the stabilization of the living of the people, should be replaced. It advised, therefore, the Maritime Customs inspectors at Tientsin and Chinwangtao to submit to the direction and control of the present Government. Both the Customs inspectors and their subordinates were willing to accept the advice in appreciation of the situation and accordingly the present Government has taken over the two Customs peacefully. With reference to the obligations secured by the Customs revenue, the present Government will dispose of the share in a fair and adequate manner."

Soon after its inauguration, the Provisional Government created a tariff readjustment committee to study a concrete plan for revising the Customs tariff in conformity with the changed situation. As a result of the function of the committee, a public notice was issued on January 21st and put in operation the following day. The notice follows:

"The Customs revenue forms an important item of the income of the state; it not only occupies a leading position in the finances of the country but also is intimately related to the commerce and industry of the nation. In consideration of this fact, the Government has decided to effect a tariff readjustment with a view to securing the Customs revenue and guaranteeing the various creditor nations' claims concerned. The readjustment will be carried out generally in accordance with the determination of the Customs authorities. On the basis of the already-established policy of the Government, however, the following revision will be effected:

1. Manchoukuo and the Kwantung Leased Territory shall be regarded as foreign lands and a Customs duty shall be imposed on the goods imported therefrom and the goods exported thereto.

2. A revision of the tariff regulations shall be effected to meet the minimum requirements of the stabilization of the living of the people in general and the revised regulations shall be enforced as from January 22nd of the 27th Year of the Chinese Republic (1938).

3. The present surtax on the Customs duty shall be abolished immediately and instead a relief surtax corresponding to 5 per cent of the total amount shall be levied for the relief of areas affected by calamities."

With reference to the tariff revision, the authorities of the Provisional Government issued an informal statement which read in substance as follows:

"The present tariff revision is the result of one month's careful deliberation of the tariff readjustment committee. In connection with import duties,

Digitized by Google

reductions and exemptions were made in regard to the minimum number of items prerequisite for the rehabilitation of the devastated areas and the relief of suffering people. With reference to export duties, adequate reductions and exemptions were made in conformity with the requirements of the industrial reconstruction of the devastated areas. In short, the tariff revision was effected from the standpoint of relieving the suffering masses and no discrimination was made against any foreign country.

"Mention must be made here of the fact that the specific trade tariff in East Hopei has now been discontinued and henceforward the revised tariff regulations will be applied to East Hopei, also. Thus, the trade situation will become stable and dishonest dealings and evasions of Customs duty will be vigorously suppressed.

Federal Reserve Bank of China With the object of promoting the industrial development of the country and the economic advance of the nation, the Provisional Government decided on January 7th to establish a Federal Reserve Bank of China, besides commencing efforts to unify the monetary system. On February 6th, the regulations governing the organization of the Federal Reserve Bank of China were promulgated and in accordance with the regulations, representatives of eight Chinese banks participating in the new institution and those of the interested Japanese quarters assembled to hold the inaugural general meeting of the new organ.

The following is a list of the leaders of the Federal Reserve Bank of China:

President and Vice-President, Wang Shih-ching
Adviser, Kiichi Sakatani
Directors: Pan Pai-mei (Manager of the Bank of China)
Hsu Pai-yuan (Manager of the Bank of Communications)
Wang I-ling (Manager of the Kincheng Banking Corporation)
Hsu Han-ching (Manager of the Continental Bank)
Hsia Yun-sheng (Manager of the Bank of East Hopei)
Li Hsuan-wei (Director of the General Affairs Bureau of the Administrative Department)
Auditors: Yueh Chien-fu (Manager of the Yien-yieh Commercial Bank)
Wang Meng-chui (Manager of the China and South Seas Bank)
Hsiung Meng-chu (Director of the Financial Bureau of the Administrative Department)

The Federal Reserve Bank of China commenced its business on March 10th when new currencies were issued for circulation in North China. The Provisional Government issued a statement in which it announced, among other things, that the Federal Reserve Bank of China had concluded a contract with the Japanese Banking Syndicate for a credit amounting to ¥100,000,000. The Provisional Government also promulgated a set of regulations concerning the adjustment of old currencies as follows:

Article 1—The bank-notes and coins issued by the Federal Reserve Bank of China shall be the national currency and all payments shall be made therewith. However, the old bank-notes hitherto in circulation shall be recognized as being current in so far as they conform to the provisions of the present regulations.

Article 2—The bank-notes of the Bank of China and the Bank of Communications as well as those issued by the Hopei Provincial Bank and the Bank of East Hopei may remain in circulation for one full year only from the date of the enforcement of the present regulations.

The bank-notes as mentioned in the foregoing paragraph shall be current at the rate of one yuan per one yuan of the national currency for the time being.

Article 3—The bank-notes of the Central Bank of China and those bank-notes of the Bank of China and the Bank of Communications which bear place names other than Tientsin, Tsingtao and Shantung may remain in circulation for three months only from the date of the enforcement of the present regulations.

The bank-notes as mentioned in the foregoing paragraph shall pass current at the rate of one yuan per one yuan of the national currency for the time being.

Article 4—Those bank-notes hitherto in circulation which are not mentioned in Article 2 and 3 shall be allowed to pass current for three months only on the basis of the provisions of the foregoing article. However, the treasury-notes issued by the Min Sheng Bank

Digitized by Google

of Shantung and the bank-notes of the Shansi Provincial Bank, the Shansi-Suiyuan Local Railways Bank, the West Suiyuan Development Bank and the North Shansi Salt Industrial Bank shall be dealt with in accordance with separate regulations.

Article 5—Small notes and coins of less than one yuan shall be handled according to separate regulations.

Article 6—Those banks issuing bank-notes as mentioned in Article 2, Article 3 and Article 4 shall recover their bank-notes in accordance with orders issued by the Government.

Article 7—All payments to the Government including those of taxes and public levies shall be made with the national currency. For the time being, however, the Government shall specify the kind of payments whereto the present regulations are applicable and the government offices which shall accept such payments.

Supplementary Rule

The present regulations shall be enforced as from the day of their promulgation.

Simultaneously, the Provisional Government promulgated a set of regulations for control of such actions likely to disturb financial conditions as are enumerated hereunder:

1. The taking out of silver without the permission of the Government.

2. Dealing in paper currency and exchange for speculative purposes.

3. Circulation of wild rumours about financial matters.

4. Other attempts at disturbance in financial circles.

Sino-Japanese Economic Council Negotiations between the authorities of the Japanese Government and those of the Provisional Government resulted in an agreement to create a Sino-Japanese Economic Council to function as the highest directing organ for the economic development of North China through Sino-Japanese collaboration. Mr. Wang Ko-min, representing the Provisional Government, and the representative of the supreme commander of the Japanese forces in North China met together in Peking on March 26th to sign a memorandum providing for the organization and operation of the council. Immediately after the signing, a joint statement was issued by the headquarters of the Japanese forces and the Provisional Government, which explained the purpose of the new organ. The statement also stated that the economic council was to be composed of 10 members equally divided between the Japanese and the Chinese and that the chairmanship was to be assumed by the chairman of the administrative committee of the Provisional Government while the vice-chairman was to be selected from among the Japanese members of the body.

The economic council was so organized as to have five sections, namely, the banking section, the financial section, the commercial section, the mining and industrial section and the agricultural section. It was indicated that the economic development of North China under the direction of the economic council would be generally divided into two stages. In the first stage, efforts would be concentrated on assisting in the accomplishment of the industrial programmes of Japan and Manchoukuo, thus laying the foundation of the economic co-operative body of Japan, Manchoukuo and China. Positive efforts for the promotion of the development of North China would be made in the second stage. The principal points follow:

1. To make efforts in the first stage to promote the exploitation of the Tatung and Kanlan coal mines with a view to feeding the heavy industries of Japan and Manchoukuo.

2. To work, along with the aforementioned efforts, for the improvement and perfection of the railway and shipping facilities in North China by way of providing for the positive development of North China in the second stage.

3. To endeavour, at the same time, to promote the production of salt at Changlu with a view to increasing the supply of industrial salt needed by the soda industry, staple fibre industry and glass industry of Japan.

4. To work, also, in the first stage, for the rehabilitation of the agricultural districts through the distribution of seeds and guidance in the improvement of crops as well as the adjustment and increase of financial facilities in order to facilitate the positive development of North China in the second stage.

Organization of the Hsin Min Hui With the object of co-operating in the execution of the policy of the Provisional Government, the Hsin Min Hui was inaugurated in Peking on December 24th. After the inaugural meeting, which was attended by many notables including Mr. Wang Ko-min, chairman of the administrative committee of the Provisional Government, a manifesto was issued clarifying the aim of the new body and announcing that deter-

Digitized by Google

mined efforts would be made to combat Communism.

After perfecting its central and local organizations, the Hsin Min Hui launched its vigorous new people's movement aiming principally at the political training of the masses and the promotion of agricultural co-operative societies. In the promotion of agricultural co-operative societies, the association stresses respect for the traditional self-governing systems of the agricultural villages and pays special attention to the creation of experimental co-operative zones, besides the training of technical instructors of co-operative societies.

Renovation Government of the Chinese Republic

Along with the progress of the Japanese military operations in Central China, the plan of the Chinese leaders in Shanghai for the establishment of a new regime materialized and the Renovation Government of the Chinese Republic was inaugurated with solemn ceremony at Nanking, the old capital of the Kuomintang administration, on March 28th. Upon its inauguration, the Renovation Government announced a 10-point platform as follows:

1. To enforce a constitutional system providing for three powers standing independent of one another and doing away with the autocratic rule by one party.

2. To exert the utmost efforts for the prevention of the spread of Communism in East Asia, thereby consolidating the foundation of the state and eliminating the source of troubles.

3. To base diplomacy on the principle of equality and make its aim the furtherance of national prestige, promoting Oriental peace in conformity with the conditions of the world and securing permanent friendships with treaty nations.

4. To have the inhabitants of the various areas affected by the military operations return home and cause them to go about their respective business as before, and create peace preservation corps, even in those areas which have not been affected by the military operations, so as to terminate banditry.

5. To place the relief of unemployment, the exploitation of natural resources, the promotion of industry and the improvement of agricultural crops under the direction of the state, inviting foreign capital and realizing a close co-operation with friendly nations for the purposes.

6. To promote the development on a sound basis of the various commercial, industrial and banking enterprises with a view to increasing the wealth of the nation.

7. To foster a people of profound wisdom and strong constitution by adding the essence of modern science to the traditional moral principles and culture of the Chinese Republic and rectifying the previous radical education and superficial knowledge.

8. To work for balancing the budget by curtailing expenses while lessening the burden on the people by abolishing all bad taxes.

9. To adopt the merit system so that men of talent and learning may render efficient services to the country and respect the freedom of speech so that the people may criticize the government at any time.

10. To enforce strict official discipline by severely punishing breaches of discipline and reforming the administrative structure.

With reference to relations with foreign Powers, the Renovation Government issued a statement announcing that the legitimate rights and interests of the Powers would be respected according to the principles of international law and international usage but that the new regime would not recognize any treaty which a foreign Power might conclude with the Kuomintang administration after the inauguration of the Renovation Government.

The general principles of the official organization of the Renovation Government are given below:

Article 1—The Renovation Government of the Chinese Republic shall exercise governing powers in the Chinese Republic.

Article 2—The Renovation Government of the Chinese Republic shall be composed of the following three yuan:

1. Executive Yuan.
2. Legislative Yuan.
3. Judicial Yuan.

Article 3—The Executive Yuan, Legislative Yuan and Judicial Yuan shall each have one president and one vice-president.

Article 4—The Executive Yuan shall be the highest administrative organ of the Renovation Government of the Chinese Republic.

Article 5—The Executive Yuan shall be composed of the various departments as enumerated hereunder:

1. Foreign Affairs.
2. Interior.
3. Pacification.

Digitized by Google

4. Finance.
5. Education.
6. Industry.
7. Communications.

The departments may be merged, increased or decreased according to the conditions of state affairs.

Article 6—The Executive Yuan shall have the following sections:

1. Secretariat.
2. Board of Decorations.
3. Board of Examination.
4. Board of Statistics.
5. Board of Ceremonies.
6. Currency Board.
7. Board of Affairs Concerning Chinese Residents Abroad.

Article 7—The Executive Yuan shall have a deliberative committee which, having three standing members, shall meet in session when required by state affairs. The presidents and vice-presidents of the Executive Yuan, Legislative Yuan and Judicial Yuan and the heads of the various departments of the Executive Yuan shall be ex-officio members of the said committee. The official organization of the committee shall be determined separately.

Article 8—The Legislative Yuan shall, until the inauguration of the national assembly, take charge of the deliberation on the legislative bills, budget estimates and matters concerning amnesty, declaration of war and negotiation for peace.

Article 9—The Legislative Yuan shall have a legislative committee of from 40 to 60 members and meetings of the committee shall be presided over by the president of the Legislative Yuan.

Article 10—The Judicial Yuan shall be the highest judicial organ of the Renovation Government of the Chinese Republic and shall have a department of Judicial administration while judicial affairs concerning administration shall be handled at an administrative litigation court.

Article 11—The present general principles shall be enforced as from the day of their promulgation.

The following is a list of the important staff members of the Renovation Government:

President of Executive Yuan,	Liang Hung-chih
Foreign Minister,	Chen Lu
Foreign Vice-Minister,	Lien Yu
Home Minister,	Chen Chun
Home Vice-Minister,	Hsia Chi-feng
Acting Pacification Minister,	Jen Yuan-tao
Pacification Vice-Minister,	Jen Yuan-tao
Finance Minister,	Chen Chin-tao
Finance Vice-Minister,	Yen Chia-shih
Education Minister,	Chen Tse-min
Education Vice-Minister,	Ku Fa-jan
Communications Minister,	Chiang Hung-chieh
Communications Vice-Minister,	Jen Fu-pang
" "	Hu Nai-tai
Minister of Industry,	Wang Tzu-hui
Vice-Minister of Industry,	Shen Neng-yi
Director of Department of Judicial Administration,	Hsu Hsiu-chih
President of Legislative Yuan,	Wen Tsung-yao
Governor of Kiangsu,	Chen Tse-min
Governor of Anhwei,	Yi Tao-liang
Governor of Chekiang,	Wang Jui-kai

Hua Chung Iron Mining Kungssu The first joint Sino-Japanese concern to be formed under the Renovation Government of the Chinese Republic was the Hua Chung Iron Mining Kungssu (corporation) which was inaugurated in Shanghai on April 8th. The inaugural meeting was attended by many notables including Mr. Wang Tzu-hui, Industry Minister of the Renovation Government, and Major-General Harada of Japan.

Taking Over of the Shanghai Customs Negotiations were commenced between Sir Robert Craigie, the British Ambassador to Japan, and Mr. Horinouchi, the Japanese Foreign Vice-Minister, in February concerning the question of the Shanghai Customs. The final agreement between them on the matter was reached on May 2nd and on the following day, the Japanese Government publish-

Digitized by Google

ed the progress of the negotiations and the contents of the agreement. According to the agreement, Mr. Li Chien-nan, superintendent of the Shanghai Customs, forwarded a note to Mr. Rawford, Commissioner of the Shanghai Customs, containing the following four points:

1. Foreign loans, the Boxer Indemnity and all other payments shall be in accordance with the arrangements made between Japan and Great Britain.

2. The remainder existing after the expenses of the Shanghai Customs, the security for foreign loans and the Boxer Indemnity have been paid shall be disposed of according to the order of the Renovation Government.

3. Matters concerning the Customs tariff and Customs regulations and questions between China and Japan shall be in accordance with the order of the Renovation Government.

4. The five-coloured flag which is designated as the national flag by the Renovation Government shall be raised atop of the Shanghai Customs building.

Commissioner Rawford approved of the note and the Shanghai Customs were peacefully taken over by the Renovation Government.

Revision of Customs Regulations While the Provisional Government in Peking effected a revision of the Customs tariff affecting 254 items on January 22nd after taking over the North China Customs, the situation brought about by the emergence of the Renovation Government in Central China rendered it necessary for the two governments to unify their tariff policies in consideration of relations with the various Powers. Accordingly, negotiations were opened between the authorities of the two governments, who agreed that the Customs system should be fundamentally reformed so as to conform to the changed situation. The revised tariff based on the agreement was announced on May 31st and enforced as from June 1st. In effecting the revision, the Provisional Government and the Renovation Government issued the following joint decree:

Article 1—A revision of the regulations governing import duties of the 27th year of the Chinese Republic (1938) is hereby promulgated and the same revision shall be enforced as from June 1st of the 27th year of the Chinese Republic.

Article 2—The regulations governing export duties of the 23rd year of the Chinese Republic (1934) shall be revised and the revised regulations shall be enforced as from June 1st of the 27th year of the Chinese Republic (1938).

Article 3—The surtax on import duties hitherto in force shall be discontinued and instead a relief surtax amounting to 5 per cent of the duty shall be levied for the relief of distressed areas.

Article 4—The various regulations of the maritime customs hitherto in force, which do not conflict with the present decree, shall be regarded as remaining in force unless otherwise provided for.

Supplementary Rules

Export duty shall be levied on native products exported to Manchoukuo and the Kwantung Leased Territory.

Import duty shall be levied on goods imported from Manchoukuo and the Kwantung Leased Territory.

In connection with the above-mentioned tariff revision, the authorities of the Japanese Foreign Office granted a press interview, in the course of which the following remarks were made:

"The new import duties as a rule follow the customs regulations enforced on January 1st, 1931, with a change to the metric system, and retain a part (20 items) of the revised tariff promulgated on January 20th by the Provisional Government of the Chinese Republic. They are to be enforced in North China and Central China alike. The new export duties follow the tariff promulgated by the Provisional Government of the Chinese Republic on January 20th and are to be enforced in Shanghai as well. The new re-export duties follow the revised levies in force in the Shanghai area since October 1st and are to be enforced in North China as well.

"It may be recalled that the tariff enforced in 1931, which forms the basis of the afore-mentioned new import duties, was the first tariff to be determined by the National Government on the basis of the tariff autonomy which it acquired with the approval of the Powers concerned in 1929. The tariff was reasonable in regard to Japanese goods, too. In 1933 and 1934 when the National Government effected upward revisions of the tariff, however, an anti-Japanese tariff wall was built up. It is a matter of common knowledge that the Japanese Government made repeated demand to the National Government for the abolition of the tariff wall.

"This time the Provisional Government and the Renovation Government have adopted the comparatively low and reasonable tariff, which fact must be welcome to both Japan and other inter-

Digitized by Google

ested countries. It may be not quite in conformity with the current situation to revive the tariff of 1931 but we have to appreciate the measures taken by the new Chinese regimes because both time and careful study are required for effecting a tariff reform and further, the economic situation in China has not yet been stabilized as the China Incident is still in progress.

"In short, the tariff revision which has just been effected is a downward revision when viewed as a whole and is a reasonable one in the light of prevailing conditions. It is a matter for congratulation for the future of the new-born China that the structure of the Customs has been unified through close co-operation between the Provisional Government and the Renovation Government."

Question of Merging the Two Governments

A delegation of the Renovation Government, comprising Mr. Liang Hung-chih, President of the Executive Yuan; Mr. Chen Chin-tao, Minister of Finance, and Mr. Jen Yuan-tao, Vice-Minister of Pacification, arrived in Peking on April 3rd to hold important conversations with the leaders of the Provisional Government with a view to realizing a unified central government. The conversations resulted in a complete accord of opinion that the two governments should be merged at an opportune time. The delegation of the Renovation Government left Peking to return to their posts on April 6th after reaching an understanding with the leaders of the Provisional Government on the following points:

1. The foreign policy should be unified under the supervision of the Provisional Government and the Renovation Government should report all diplomatic affairs to the Provisional Government as such affairs occur.

2. The customs tariff should be unified according to the tariff policy of the Provisional Government.

3. For the time being, the salt gabelle collected in Central China should be assigned to cover the expenses of the Renovation Government. The consolidated tax being levied on cement, cigars, cotton yarn, flour, matches and beer should also be made a source of revenue for the Renovation Government for the time being.

4. The bank-notes and coins issued by the Federal Reserve Bank of China should be made current in Central China in due course of time and until then the old legal tender may circulate in Central China.

Formally to return the visit of the delegation of the Renovation Government, Mr. Wang Ko-min, chairman of the administrative committee of the Provisional Government, arrived in Shanghai on April 28th and called on Mr. Liang Hung-chih on April 30th. In the course of their interview, further conversations concerning the question of merging the two governments were held. This time they agreed to have a joint committee created as a preparatory organ for the realization of the merger of the two governments.

Mongolian Governments

South Chahar Autonomous Government The old Chahar Provincial Government collapsed on August 24th, 1937, when General Liu Ju-ming, chairman of the provincial government, together with his lieutenants, fled the district. Four days later, a peace preservation committee was organized as an emergency measure to cope with the situation. Representatives of the various circles in the province then met in conference on September 3rd when a resolution was passed for the establishment of a South Chahar Autonomous Government by severing the relations between the province and the National Government. The new regime was inaugurated on September 4th.

The leaders of the autonomous government include:

Members of the Supreme Committee:

Tu Yun-yu (in charge of finances and banking)

Kan Pin-hsiang (in charge of communications)

Chen Wang-yu

North Shansi Autonomous Government A peace preservation committee for North Shansi was created on September 14th, 1937, one day after the occupation of Tatung by Japanese forces. On October 15th, the North Shansi Autonomous Government was established in accordance with the following organic law:

Article 1—The North Shansi Autonomous Government shall represent the collective will of the inhabitants of North Shansi.

Article 2—The North Shansi Autonomous Government shall have one highest adviser, one highest committee-man and two committee-men.

The highest committee-man shall supervise the conduct of the affairs of the Government, controlling the various governmental organs.

Important matters of the Government

Digitized by Google

shall be referred to a conference of the highest adviser, the highest committee-man and the committee-men.

Article 3—The North Shansi Autonomous Government shall have a secretariat, a civil administrative board, a finance board and a public safety board.

Article 4—The various boards shall each have one adviser and one director. The board directors shall take charge of the business of their respective boards acting under the instructions of the highest committee-man.

Article 5—The Secretariat shall handle the government seals, documents, personnel affairs and confidential matters of the Government.

Article 6—The Civil Administrative Board shall handle matters concerning the local administration, education, public works and local industries.

Article 7—The Finance Board shall handle matters concerning taxation, public loans, banking, governmental enterprises and key industries.

Article 8—The Public Safety Board shall handle police and judicial affairs.

Article 9—The regulations governing the organization of the secretariat and the various boards shall be determined separately.

Article 10—The present organic law shall be enforced as from the day of its promulgation.

Inner Mongolian Autonomous Government A general meeting of the leaders of Inner Mongolia was held in the walled town of Suiyuan on October 27th, 1937, when a resolution was passed for the formation of an Inner Mongolian Autonomous Government under the chairmanship of Prince Yun to be assisted by Prince Teh as vice-chairman. The general principles of the official organization of the autonomous government are as follows:

Article 1—The chairman of the Inner Mongolian Autonomous Government shall be a person who has rendered meritorious services in the restoration movement of the Mongols and shall be designated as such at the Mongolian congress. The chairman shall be the head of the Inner Mongolian Autonomous Government. In the absence of the chairman, the duty shall be performed by the vice-chairman.

Article 2—The Inner Mongolian Autonomous Government shall have for its territory the regions which originally belonged to the Mongols. For the time being, however, its territory shall comprise the Ulanchap League, the Silinghol League, the Ikochao League, the Houho City and the Paotou City.

Article 3—The Inner Mongolian Autonomous Government shall aim at the prevention of the spread of Communism and stand for the amity and harmony of races.

Article 4—(omitted)

Article 5—The chronological year of the Inner Mongolian Autonomous Government shall be in conformity with the period counting from the era of Chinghis (Genghis) Khan.

Article 6—The Inner Mongolian Autonomous Government shall have its capital in Houho.

Article 7—The regulations governing the relations between the Inner Mongolian Autonomous Government and its various local organs shall be determined separately.

Article 8—The organic law of the Inner Mongolian Autonomous Government shall be determined separately.

The provisional organic law of the Inner Mongolian Autonomous Government is given below:

Article 1—The Inner Mongolian Autonomous Government shall be composed of a political council and a general headquarters and shall be supervised by a chairman.

Article 2—The chairman shall be elected at the Mongolian congress and his term of office shall be five years. The regulations governing the organization and powers of the Mongolian congress shall be determined separately.

Article 3—The chairman shall be responsible for all matters concerning the administration of the Union of Inner Mongolia.

Article 4—The Inner Mongolian Autonomous Government shall have one vice-chairman who shall assist the chairman and represent him when he is absent under unavoidable circumstances. The vice-chairman shall be appointed by the chairman with the approval of the Mongolian congress.

Article 5—The political council shall have a president who shall supervise the conduct of all affairs of the council.

Article 6—The general headquarters shall handle military affairs and shall have a commander-in-chief.

Article 7—The decrees issued by the chairman shall be countersigned by the commander-in-chief when military affairs are concerned and by the president of the political council when other matters are concerned.

Article 8—The Inner Mongolian Autonomous Government may have political and military advisers in order to assist the chairman.

Article 9—The Inner Mongolian Au-

Digitized by Google

tonomous Government may have counsellors in order to give counsel to the chairman in regard to administrative affairs.

Article 10—The regulations governing the various sections of the Inner Mongolian Autonomous Government and the various local government offices shall be determined by the decree of the chairman.

Supplementary Rule

The present organic law shall be enforced as from December 1st of the 732nd year after the era of Chingghis Khan.

The following is a list of the important staff members of the autonomous government:

Chairman, Prince Teh
Vice-Chairman, Li Shou-chen
President of the Political Council, Tao Ko-tao
Commander-in-Chief, Li Shou-chen

(Note: At the outset, Prince Yun was elected chairman of the autonomous government but after his death on March 24th, the chairmanship was assumed by Prince Teh.)

Federation of Autonomous Governments of Mongolian Provinces In appreciation of their common cause which is featured by the determination to combat Communism and work for racial harmony, the autonomous governments of Inner Mongolia, South Chahar and North Shansi created a joint committee on November 22nd, 1937, in order to facilitate their concerted actions. The agreement for the creation of the organ was signed by representatives of the three governments who assembled in Changchiakow (Kalgan) on November 22nd for the said purpose. It must be noted that the realization of the close co-operation among the three governments forms a strong wing of the anti-Communist axis created by Japan, Germany and Italy.

The first general meeting of the joint committee was held on November 23rd when it was decided to establish a Mongchiang (Mongolian Marches) Banking Corporation to do the banking business in South Chahar and Suiyuan. The new bank, capitalized at 12,000,000 yuan and financed equally by the three autonomous governments, opened its business on December 1st. On the same day, it approached the Bank of Japan with an offer to purchase ¥1,000,000 worth of public loan bonds of Japan. Upon the founding of the bank, the Bank of South Chahar, which forms the nucleus of the new concern, issued a statement which in substance read as follows:

"The Bank of South Chahar, which was opened to business with its head office in Changchiakow (Kalgan) on October 1st has already made considerable contribution towards promoting financial facilities along the Peking-Suiyuan Railway line. As a result of the creation of the joint committee of the autonomous governments of Inner Mongolia, South Chahar and North Shansi, it has now been decided to rename the present bank "the Mengchiang Banking Corporation," as if it were the establishment of a new bank. The capital is to be increased to 12,000,000 yuan. Both the government bank in Suiyuan and the Feng Yeh Bank will be absorbed into the new concern."

The China Affair and Diplomacy

A review of the attitudes of the various Powers toward the China Affair shows that Great Britain and the Soviet Union have been extending both material and moral assistance to the Chiang Kai-shek regime since the outbreak of the incident. The United States has refrained from the application of its Neutrality Act but it has been maintaining a neutral attitude, while showing delicate movements. The attitude of France has been one of following the example of Great Britain in most cases. As for Germany and Italy, they are both closely bound to stand on the side of Japan by the anti-Communist pact but the attitude taken by Germany has been slightly different from that taken by Italy on account of its economic interests in China.

Anglo-Chinese Relations When the Incident spread to Shanghai, Great Britain, regarding the Yangtze Valley as her sphere of influence, began to render assistance to the Chiang Kai-shek regime. She came to take a hostile attitude toward Japan while extending both direct and indirect assistance to support the Chiang administration. Particularly, she took such actions in the course of the Shanghai battle as could not be passed unnoticed.

Simultaneously, Britain made great efforts to induce the United States and France to intervene in the Sino-Japanese conflict, displaying constant diplomatic activities. When the North China incident occurred, the British Government expressed its desire to realize a close co-operation between Britain and the United States in dealing with the situation and made overtures to the Washington authorities. With reference

Digitized by Google

to the British overtures, Mr. Cordell Hull, the Secretary of State of the United States, stated in the course of a press conference that the Government had received a notification from the British Foreign Secretary and had merely ackowledged the notification, which showed that the United States had not accepted the British proposals which were reported to be concerted actions by Britain, the United States and France urging Japan and China to discontinue the use of armed force. It was further reported that Britain made such proposals to the United States at the instance of the Chiang Kai-shek regime and after consulting with France.

As the United States maintained a cautious attitude, showing no sign of an intention to accept the British proposals, however, the British Government acted independently and through its diplomatic service, expressed its views and wishes to the Japanese Government.

When the Sino-Japanese hostilities commenced in Shanghai, the various interested Powers separately urged that Shanghai be excluded from the war zone. The situation in Shanghai, however, continued to be aggravated and on August 18, 1937, the British Government suddenly presented proposals to the Japanese Government and the National Government for the creation of a neutral zone in Shanghai. The proposals contained the following major points:

1. The Shanghai area shall be made a neutral zone and both the Japanese and Chinese forces shall withdraw from the zone.

2. The demarcation of the neutral zone shall be made through local negotiations on the spot.

3. Matters concerning the protection of the Japanese residents in the neutral zone shall be handled by the British Government on condition that the Governments of the United States and France extend their assistance.

It is said that the neutral zone proposals were worked out by Mr. J. W. Davidson, British consul-general in Shanghai, and adopted by the British Government. The proposals were also submitted to the American and French Governments together with a request that the two governments co-operate in the realization and execution of the proposals. The National Government accepted the proposals and the French Government expressed support for them but the American Government, considering the proposals to be impracticable, took an indifferent attitude and did not give a reply. The Japanese Government maintained that the Shanghai hostilities had been caused by Chinese provocation and that the way to a solution of the issue was for the Chinese regulars and peace preservation corps to evacuate the demilitarized zone as stipulated by the Shanghai truce of 1932 and thus rejected the British proposals.

The British Government forwarded an official note to the Japanese Government on August 21, 1937, demanding an indemnity. The British note asserted that Japan should be responsible for the payment of an indemnity against the losses sustained by British residents through the Sino-Japanese conflict and that Japan should be responsible for paying rentals, besides making compensation for losses, in regard to the buildings owned by British nationals within the International Settlement which were occupied by Japanese forces.

Thus, Britain made one diplomatic move after another and aimed at inducing the United States to take concerted action. The matter was submitted to the League of Nations, but the League proved powerless, and delegated the subject to a conference of the signatories of the nine-Power treaty with a view to dragging the United States, leading figure in the conclusion of the pact, into the whirlpool. The United States, however, maintained a cautious attitude.

Finding it difficult to secure the cooperation of the United States immediately, Britain finally resolved to act, even single-handed, in rendering the greatest possible assistance to the Chiang Kai-shek regime, the assistance being mainly financial.

It is considered that the key to the limit of the British assistance to the Chiang regime lies in the amount of the Chinese specie holdings abroad. Previously, large quantities of silver had been hoarded in China but when the monetary system was reformed, the National Government obtained an enormous amount of silver through the nationalization of the white metal. It is believed that the specie holdings of China in London and New York were increased to an unprecedented extent. It is the existence of the specie holdings that has formed the basis of the British financial assistance to the Chiang administration.

Attitude of the American Government As already stated, Great Britain made overtures to the Government of

Digitized by Google

the United States when the North China incident occurred, but the latter did not accept the overtures. While there has been no perceptible change in the attitude of avoiding embroilment in the Sino-Japanese dispute, the United States has gradually become nervous over the Far Eastern situation, and though taking an attitude rather cautious as compared with that of the Stimson doctrine, the present administration of the United States has of late come to follow a policy which seems to have only minor differences from that followed by the preceding administration. Nevertheless, it must be noticed here that the United States has always acted in such a manner as to show its intention of dealing with the situation from an independent standpoint, refusing to dance to the tune played by Great Britain.

Breaking the silence which the Government of the United States had maintained toward the North China incident, Mr. Cordell Hull, the American Secretary of State, made a statement on July 16, 1937, that the United States was concerned over any trouble in any section of the world because such trouble could not but affect the interests, rights or obligations of the United States. The statement emphasized the abstract principle of peace or respect of treaties and also touched upon the question of armaments. This statement did not mention any specific nation and merely repeated the foreign policy of the Washington Government, being illustrative of the cautious attitude taken by the United States.

When the situation became aggravated through hostilities spreading to the international port area of Shanghai, much discussion arose in both government and civilian circles in the United States about the question of operating the Neutrality Act, but it was finally decided that it should not be invoked in consideration of the necessity of guaranteeing the security of the American residents in China and the necessity of avoiding embroilment in the vortex of war. For the purpose of guaranteeing the security of the American residents, a contingent of 200 marines was rushed to Shanghai from San Diego and at the same time, the American residents in the dangerous localities were advised to withdraw to safe places.

Further, the Government of the United States urged that the Japanese and Chinese Governments should protect the vested rights and interests of the United States and forwarded a notice to the effect that the Japanese and Chinese Governments should assume responsibility for any losses which the Government of the United States and American citizens might sustain as a result of the Sino-Japanese hostilities.

In consideration of the public opinion at home, President Roosevelt formally announced the banning of shipment of arms to Japan and China by government-owned vessels on September 14th.

Great international sensation was caused by the news that several hundred casualties including four American citizens (one of them being the correspondent of the New York Times) had been caused in a central position in Shanghai by a bombardment by Chinese planes and on September 23rd, 1937, Secretary of State Cordell Hull telegraphed a strong protest to the National Government and at the same time made another statement on the current situation. The second statement clarified certain points which had been left ambiguous by the first statement, giving a general idea of the determination of the American Government to avoid embroilment in any political alliance or trouble but to oppose extreme isolation.

On October 5, 1937, President Roosevelt in addressing an audience in Chicago made the highly inflammatory remarks that international peace was at stake, blamed the aggressor nations (though not giving any specific names) and urged the peace-loving nations to cooperate with one another in effecting a quarantine against the aggressor nations. The speech of President Roosevelt gave an impression that the United States was finally abandoning the policy of quiet watching and was about to take some positive actions. The truth, however, seemed to be that the President intended his speech for home consumption as well as a gesture toward the League of Nations and the conference of the signatories of the nine-Power pact.

On October 6th, one day after President Roosevelt had made his speech in Chicago, the Department of State issued a statement asserting that the action taken by Japan in China ran counter to international principles, besides infringing upon the nine-Power pact and the anti-war pact. This was a statement of the views of the American Government appreciating the official report received from the League Assembly on October 6th. Stress was then laid upon the importance of the various principles governing international rela-

Digitized by Google

tions such as were clarified by President Roosevelt in his Chicago speech, namely:

1. Opposition to the use of armed force for the execution of policies and interference with the internal affairs of other countries;

2. Adjustment of international relations through peaceful negotiations and by agreements;

3. Respect by all nations of the rights of other nations;

4. Upholding of the principle of sanctity of treaties.

It was also observed that President Roosevelt had pointed out the following points in examining the international situation:

1. Unless all nations observe law and morality, it will be impossible for tranquillity and peace to exist between nations or within a nation;

2. International anarchism will undermine the very foundation of peace;

3. It in turn will, either immediately or in the future, jeopardize the security of nations, big or small;

4. It therefore is the greatest concern to the American people to see that the spirit of respecting treaties and international morality is restored.

Thus, it may be noted that the third American statement did nothing more than stress the attitude of the United States for upholding principles of peace and for respect of international treaties.

With the League of Nations having taken care to facilitate the United States to co-operate by having revived the advisory committee of 23 nations which had been created at the time of the Manchurian Incident, the United States appointed its Minister to Switzerland to participate in the League meetings in the capacity of an observer and with the same object that characterized the participation of the United States in the League meetings at the time of the Manchurian affair. In other words, the United States' representative to the League meetings gave his counsel at the request of the League but did not participate in any voting.

When the political stage shifted from the League of Nations to the conference of the signatories of the nine-Power pact, the United States dispatched a delegation headed by Mr. Norman Davis, Ambassador-at-large. Great Britain attempted to make the United States the prime mover at the nine-Power pact conference, which was held at Brussels, on the ground that the United States sponsored the nine-Power pact, but the United States did not act just as Britain wished her to do. As a result, the Brussels conference, too, ended in failure.

On May 14, 1938, two days after Secretary of State Cordell Hull announced the principle of non-recognition of invaded territories in connection with the recognition by the League of Nations of the annexation of Ethiopia by Italy, the authorities of the Department of State expatiated upon the announcement and declared that the non-recognition principle would be maintained in regard to the new Chinese regimes established in North China and South China from the same standpoint that the Government of the United States refused to recognize the independence of Manchoukuo. It was also stated that accordingly, Mr. Nelson T. Johnson, the American Ambassador to China, was to be stationed at Hankow so long as the Chiang Kai-shek regime remained there and that the Ambassador was to be transferred to wherever the Chiang administration should establish its offices.

In June, 1938, the United States together with Great Britain and France issued a statement denouncing aerial bombardments, under the influence of the propaganda conducted by the Chinese in connection with the bombardment of Canton by the air force of the Japanese Navy. The Chinese publicists told the various nations that the Japanese naval air force had been bombarding defenceless Chinese cities, causing casualties among non-combatants. On June 11th, Secretary of State Cordell Hull, in the course of a press conference, touched upon the matter and intimated that the Government of the United States would express its opposition against aerial bombardments through checking the exportation of military planes.

Soviet Assistance When Mr. Sun Fo, special emissary of the National Government who had been on a tour of Europe since January with the mission of securing assistance from the Soviet Union and Great Britain and France, paid a second visit to Moscow in June, 1938, rumours were revived about the conclusion of a secret military alliance between the Soviet Union and China. This happened at a time when the Chinese troops had suffered a crushing defeat in the Hsuchow area at the hands of Japanese forces and were in great consternation retreating towards Hankow. It was considered by some circles as possible that the National Government, like a drowning man catching at a straw, had concluded a military

Digitized by Google

pact with the Soviet Union by accepting the severe terms imposed by the latter, among which were said to be the following five major points:

1. Joint defence of the Soviet-Chinese frontiers;
2. Supply of arms to the Communist guerrilla corps;
3. Recognition of the specific rights and interests of the Soviet Union in Sinkiang, Ninghsia and Chinghai;
4. Employment of Soviet nationals to serve as advisers to the chairman of the National Government;
5. Reform of the administrative structure of the National Government.

Whether the contents of the alleged secret pact are exactly based on the afore-mentioned terms or not still remains to be known but it is considered almost certain that the Soviet Union secured specific rights and interests in the Sinkiang area in the negotiations for the pact. Some sources even reported that the Soviet Union acquired the right to station one division of Soviet troops in Sinkiang in return for supplying arms to the Chiang Kai-shek regime's troops. At any rate, it is clear that the Soviet Union has been making positive machinations aiming at the increase of the influence of the Chinese Communists through assisting in the long-term anti-Japanese operations.

Positive Activity of France The attitude of France toward the China Affair has been one of following the example of Great Britain in most cases, reflecting the diplomatic dealings between the two countries in regard to the European situation. Since the outbreak of the incident, France has endeavoured to supply arms to the Chiang Kai-shek regime, concluding an agreement with Dr. H. H. Kung for a 200,000,000-franc credit for the purchase of arms for the Chiang administration. One of the routes for the transportation of the arms leads from Haiphong in French Indo-China to Kunming in Yunnan Province by rail, with Kunming being linked to Kweiyang in Kweichow Province by motor car and carriage. The other route leads also from Haiphong to Chennankwan on the border of Kwangsi Province by rail, with Chennankwan being linked to Nanning and Kweilin by motor car and carriage.

It was further reported that an agreement had been reached between France and the Chiang Kai-shek regime whereby a railway connecting Chennankwan and Nanning would be constructed in five months with French capital. Following the defeat of the Chinese troops in the Hsuchow area, it was indicated that France was going to give greater assistance to the Chiang regime than ever before in consideration of the close relations between French Indo-China and Yunnan Province where the Chiang regime means to establish its final base. It is easy to suppose that France has been active in securing whatever possible concessions she can from the Chiang regime in return for her assistance, taking advantage of the relations between Yunnan and French Indo-China.

After the German military advisers to the National Government had withdrawn from China, France joined the Soviet Union in supplying necessary military advisers to the National Government.

Germany and Italy Both Germany and Italy are bound by the anti-Comintern pact to stand by Japan in the China Affair. There has, however been a difference between the attitude taken by Italy and that of Germany. Italy was quick in liquidating all sorts of relations with the Chiang regime such as might be taken to mean Italy's assistance to it, by discontinuing the sale of arms to China and withdrawing its nationals from among the military advisers to the National Government. The attitude taken by Germany in manifesting friendship toward Japan, however, was not quite thorough-going from the very outset. It was not until the latter part of May when the German Government issued a strict order to the German military advisers to the National Government to withdraw that the German advisers resolved to quit the National Government. This dealt a great blow to the Chiang regime inasmuch as the plans of operations and the construction of defence works had been principally in the charge of the German advisers.

Special mention must be made here of the fact that Germany tried to pave the way for peace between Japan and China, but its good offices were set at naught by the lack of sincerity on the part of the Chiang Kai-shek régime, as it was mentioned elsewhere.

Incident and China's Economy

The exact figures of the economic losses which China has sustained directly and indirectly as a result of the Incident are still difficult to obtain, but a Chinese economic expert estimates that up to the end of March, 1938, they totalled some 14,000,000,000 yuan, and included approximately 200,000,000 yuan for military operations, 10,000,000,000 yuan damage to general buildings and property, 800,000,000 yuan lost by commercial and industrial circles and the

Digitized by Google

decrease in taxation receipts, and 3,000,000,000 yuan in the incomes of individuals in general.

Surveys conducted by various Chinese circles show that the Chinese losses sustained directly in connection with the hostilities in Shanghai total 4,450,384,560 yuan, as compared with 1,483,461,854 yuan in the Shanghai affair of 1932. The losses arising from the destruction of civilian houses by fires are estimated at 333,000,000 yuan. The various cultural organs are estimated to have sustained a total loss of 10,360,000 yuan, including 6,000,000 yuan for 15 universities and colleges, 2,100,000 yuan for 27 secondary schools, 260,000 yuan for 42 primary schools and 2,000,000 yuan for institutions for social education. The estimated losses sustained by shipping interests total 70,000,000 yuan, for 475 steamers of no less than 100 tons each or a total of 570,000 tons of steamers sunk, confiscated or used for blockading purposes in the Shanghai area.

According to an estimate by an American, the total losses sustained by foreigners amount to 844,400,000 yuan. Details of the estimate are shown in the following table:

Factories and equipment thereof	350,000,000 yuan
Other immovable property	200,000,000 "
Import profits	12,500,000 "
Export profits	5,000,000 "
Decrease in domestic trade	140,000,000 "
Damages to steel, iron and other metal wares	13,400,000 "
Imports by other ports	12,500,000 "
Damages to warehouses	50,000,000 "
Losses of merchandise in war zones	50,000,000 "
Losses of shipping firms	10,000,000 "
Miscellaneous losses of foreign residents	1,000,000 "
Total	844,400,000 "

A report dated November 8th which was presented to the Ministry of Industry by the social welfare bureau of the Shanghai Municipal Office estimates that a total loss amounting to 500,000,000 yuan was caused to more than 2,000 factories within the city of Shanghai alone, including Chapei, Kiangwan, Woosung and Chenju. Some details concerning the losses sustained by the weaving and spinning mills are shown in the following table:

	Number of Mills	Number of Spindles	Number of Weaving Machines
Weaving and spinning mills located in the city of Shanghai	31	1,237,074	8,754
Weaving and spinning mills which sustained losses in the incident	13	423,394	2,342
Percentage of losses	42%	34%	26.7%

The number of factory workers and mill hands who became jobless on account of the incident is quite enormous. According to an investigation made in the early part of November, there were in Shanghai only about 50,000 factory workers and mill hands or 30 per cent of the number recorded prior to the outbreak of the incident. In other words, about 120,000 workers were thrown out of employment as a result of the outbreak.

The loss of the Shanghai-Nanking area dealt a great blow to the economy of China. In this connection, it must be noted that a great difference exists between the loss of the Shanghai-Nanking area, which was thoroughly devastated by gunfire, and the loss of the Peking-Tientsin area, which was taken over intact from the control of the Chiang Kai-shek regime. There is no need to emphasize the fact that Shanghai formed the economic centre of China, accounting for one half of the manufactured goods produced in the country, numerous weaving and spinning mills, flour mills, cement factories, arsenals and ship-building yards being located there. In Nanking, there were ice-factories, flour mills and silk weaving mills. Big rice-cleaning mills, flour mills, filatures and spinning mills were located in Wuhsi and manufactories for flour, matches and cement were to be found in Chinkiang, while Hangchow was the seat of the only aeroplane factory of China and in addition contained some arsenals.

Some details of the Chinese spinning mills which were either totally or partially destroyed by gunfire in the Shanghai area are shown in the following tables:

Digitized by Google

1. Totally Destroyed Chinese Spinning Mills

Name of Mill	Spindles	Doublers	Looms	Labourers employed
Yung An No. 2	49,696	—	—	1,856
Yung An No. 4	69,460	35,200	—	1,800
Pao Shing	12,240	2,520	200	855
Tien Sheng	11,588	—	—	630
Shen Hsin No. 1	72,476	—	1,387	3,902
Shen Hsin No. 8	50,400	—	—	2,122
Ming Sung	9,000	400	128	Not working
Heng Dah Sing Kee	21,600	—	—	850
Total	296,560	38,120	1,715	12,025

2. Partially Destroyed Spinning Mills

Name of Mill	Spindles	Doublers	Looms	Labourers employed
Dah Foong Ching Kee	29,950	—	—	1,940
Chung Hsin	34,000	—	—	1,940
Chen Ting	28,502	—	—	2,044
Tai Chi	25,500	5,040	640	140
Heng Fong	54,544	—	614	3,000
Total	172,498	5,040	1,254	9,064

The losses sustained by the Japanese spinning mills cannot be considered as pure economic losses to China but this fact does not prevent the losses from constituting a change in an important component of China's economic structure. It is estimated that the Japanese interests in Shanghai sustained total losses amounting to 200,000,000 yen, of which the losses to spinning mills are estimated at around 40,000,000 yen. The Japanese spinning mills in Tsingtao, comprising 6,500 spindles, 47,000 doublers and 4,412 looms were totally destroyed. The losses thus sustained are estimated at over 100,000,000 yen.

As a result of the Manchurian Incident and the China Affair, the Chiang Kai-shek regime lost the greater part of its important industrial zones. This fact is well illustrated by the following table which shows the distribution of modern industry in China (the table apparently having been compiled by Chinese, as might be supposed from the inclusion of the "Three Eastern Provinces."):

DISTRIBUTION OF MODERN INDUSTRY (1934)

Industry	Three Eastern Provinces	Hopei, Shantung, Kiangsu, Chekiang	Fukien Kwangtung	Others
Steel and iron	13.0%	15.0%	—	72.0%
Cast iron	4.5	81.8	13.7%	—
Leather	4.5	67.0	2.0	26.5
Cement	80.0	14.0	6.0	—
Rubber	—	85.4	14.6	—
Oil	57.7	23.5	12.5	6.3
Machinery	25 factories	174 factories	20 factories	42 factories
Match	13 "	52 "	11 "	9 "
Paper	9 "	16 "	3 "	4 "
Glass	—	34 "	12 "	32 "
Tobacco	—	44 "	—	—
Silk	42 "	121 "	37 "	12 "
Egg	—	5 "	—	118 "

The separation of North China from the Chiang Kai-shek regime is also highly significant from the standpoint of national resources. The emergence of the Provisional Government of the Chinese Republic in Peking to replace the Chiang administration in governing North China brought about a situation favourable for including the vast natural resources in a Japanese-Manchoukuo-

Digitized by Google

Chinese economic bloc. The following tables show the estimated deposits of coal, the output of coal, and the estimated deposits of iron ore in the various provinces of North China:

1. Deposits of Coal

Location	Deposits	Proportion to Total Deposits in China
Hopei Province	3,071,000,000 tons	1.26%
Shantung "	1,639,000,000 "	0.67
Honan "	6,624,000,000 "	2.72
Shansi "	127,127,000,000 "	52.17
Shensi "	71,950,000,000 "	29.53
Chahar "	504,000,000 "	0.21
Suiyuan "	417,000,000 "	0.17
Total	211,332,000,000 "	86.73

2. Output of Coal (1931)

Origin	Production	Origin	Production
Hopei Province	7,660,000 tons	Shensi "	227,000 "
Shantung "	2,093,000 "	Chahar "	114,000 "
Honan "	1,844,000 "	Suiyuan "	91,000 "
Shansi "	2,266,000 "	Total	14,295,000

3. Deposits of Iron Ore

Location	Deposits	Proportion to Total Deposits in China
Hopei Province	32,424,000 tons	13.69%
Shantung "	13,700,000 "	5.78
Honan "	1,019,000 "	0.43
Chahar "	91,645,000 "	38.69
Total	138,788,000 "	58.59

The estimated deposits of coal in Central China are shown in the following table:

Location	Deposits	Proportion to Total Deposits in China
Anhwei Province	360,000,000 tons	0.15%
Chekiang "	100,000,000 "	0.04
Kiangsu "	217,000,000 "	0.09
Total	677,000,000 "	0.28

In Central China, there are not many areas under Japanese influence which contain deposits of iron ore. The Taochung and Tangtu iron mines in Anhwei Province, however, are two of the most important mines of this kind in China, their output being shown below:

OUTPUT OF IRON ORE

	1932	1933	1934
Taochung Iron Mine	101,333 tons	110,000 tons	280,000 tons
Tangtu Iron Mine	166,710 "	150,000 "	200,000 "

The principal agricultural products of North China and Central China and the amount of the annual production thereof are tabulated as follows:

Trade The foreign trade of China during the first half of 1937, that is, prior to the outbreak of the China Incident, was unusually active, but its substance suffered a sudden change as a result of the outbreak. The effect of the Incident is well illustrated by the following figures:

Table No. 1

(not affected by Incident)

(In yuan)

	Jan.-July, 1937	Jan.-July, 1936
Imports	731,587,000	535,759,000
Exports	571,837,000	393,552,000
Total	1,303,424,000	929,311,000
Excess of imports	159,750,000	142,207,000

Table No. 2

(affected by Incident)

(In yuan)

	Aug.-Dec., 1937	Aug.-Dec., 1936
Imports	224,647,000	408,764,000
Exports	266,286,000	313,239,000
Total	490,933,000	722,003,000
Excess	42,286,000	95,525,000

(Note: The underlined figures denote excess of exports, while those not underlined denote excess of imports.)

The excess of exports recorded for the period from August to December is quite singular and was brought about by a sudden and greater decrease in imports than exports, probably through the hurried shipment of stocks out of the various ports. The increase in

Digitized by Google

shipments to Hongkong was particularly conspicuous. Under the circumstances, it is but natural that the volume of trade with Japan should have shrunk remarkably. This is shown in the following table:

CHINA'S TRADE WITH JAPAN

(In yuan)

	Jan.-July, 1937	Aug.-Dec., 1937
Imports	19,527,000	2,749,000
Exports	10,221,000	2,553,000
Total	29,748,000	5,302,000

The monthly average of imports fell from 2,500,000 yuan in the pre-incident period to 550,000 yuan after the outbreak, and the monthly average of exports fell from 1,460,000 yuan to 510,000 yuan.

The effect upon the trade with the United States was remarkable. The monthly average of imports dropped from 26,000,000 yuan before the incident to 10,000,000 yuan after, but it must be noticed that the trade with Great Britain showed no such decline. This fact indicates the active trade conducted through Hongkong and also manifests the specific position of Britain in the China Incident.

The position of Shanghai in foreign trade presents a striking contrast to the prosperity of Hongkong. The amount of foreign trade conducted by Shanghai during 1937 was 914,000,000 yuan, made up of 510,000,000 yuan in imports and 404,000,000 yuan in exports. Compared with the similar figures for 1936, imports decreased by 8 per cent and exports increased by 11.8 per cent while the total amount showed a decrease of 0.1 per cent. While the trade conducted by Shanghai accounted for 56 per cent of the foreign trade of China during 1936, the percentage dropped to 51 per cent in 1937, Shanghai's percentage being from January to July 56.9 per cent and from August to December 34.7 per cent. Generally speaking, the share of South China in the foreign trade of the republic has increased remarkably.

The following tables show the changes brought about by the Incident in the foreign trade of China as classified according to localities.

1. Imports (In 1,000 yuan)

	1936		1937	
	Amount	Percentage	Amount	Percentage
North China	140,903	14.9	145,790	15.3
Central China	637,697	67.5	591,944	61.9
South China	165,923	17.6	218,500	22.8
Total	944,523	100.0	956,234	100.0

2. Export (in 1,000 yuan)

	1936		1937	
	Amount	Percentage	Amount	Percentage
North China	191,112	27.0	215,741	25.7
Central China	380,640	53.0	417,025	49.7
South China	135,039	19.1	206,004	24.6
Total	706,791	100.0	838,770	100.0

3. Trade in 1937 (In 1,000 yuan)

	January-July		August-December	
	Amount	Percentage	Amount	Percentage
Imports				
North China	114,194	15.6	31,636	14.1
Central China	500,372	68.3	91,572	40.8
South China	117,061	16.1	101,439	45.1
Total	731,587	100.0	224,647	100.0
Exports				
North China	160,452	28.4	55,289	20.7
Central China	312,714	54.6	104,313	39.1
South China	98,673	17.0	107,331	40.2
Total	571,837	100.0	266,933	100.0

Digitized by Google

According to customs statistics, the imports of China during the first quarter of 1938 amounted to 231,840,000 yuan (as compared with 271,486,000 yuan for the corresponding period of the preceding year) and in exports 134,268,000 yuan (as compared with 239,981,000 yuan for the corresponding period of the preceding year). In other words, the trade during the first quarter declined by 15 per cent in imports and 38 per cent in exports from the similar figures for the corresponding period of 1937. Details of the change, according to localities, are shown below:

	Imports		Exports	
	Jan.-March 1938	Jan.-March 1937	Jan.-March 1938	Jan.-March 1937
North China	15.48%	14.47%	24.74%	28.61%
Central China	24.50	70.27	25.55	52.86
South China	60.02	15.26	49.71	18.53
Kowloon	43.23	4.53	4.34	0.34
Canton	7.15	3.20	19.98	6.16

The foregoing figures show that the increase in the trade conducted by South China centred around Kowloon. In this connection, it must be observed that while the Yangtze River had hitherto constituted the principal channel for the conduct of the foreign trade of China, the channel shifted to the Hankow-Canton Railway as a result of the blockade of the lower reaches of the river after the outbreak of the China Incident.

Railways and Public Highways Construction of railways has been the most important economic item carried out in China during recent years, particularly noteworthy being the completion of the Canton-Hankow Railway in September, 1936. As the situation in North China became strained, greater attention was paid to perfecting the network in South China, but as a result of the China Incident, the greater part of the Chinese railways has been placed under Japanese control, as shown in the following table:

Name of Railway	Total track	Under Japanese control (in kilometers)	Under Chiang régime
North of the Yangtze River			
Peking-Hankow	1,319	800	519
Tientsin-Pukow	1,105	1,105	—
Peking-Suiyuan	878	878	—
Peking-Shanhaikwan	466	466	—
Kiao-Tsi	453	453	—
Lung-Hai	1,226	530	696
Cheng-Tai	278	278	—
Taokow-Chinghwa	152	152	—
Tung-Pu	1,013	1,013	—
Kaifeng-Honan (?)	214	214	—
South of the Yangtze River			
Nanking-Shanghai	329	329	—
Shanghai-Hangchow-Ningpo	209	209	—
Soochow-Chiating	74	74	—
Canton-Hankow	1,242	—	1,242 (?)
Chekiang-Kiangsi (?)	650	—	650
Nanchang-Kiukiang	128	—	128
Canton-Kowloon	143	143 (?)	—
Kiangnan	178	178	—
Total	10,135	6,822	3,147

Thus, over 60 per cent of the Chinese railways has been separated from the control of the Chiang Kai-shek régime. There is no need to emphasize the military and economic importance of this great loss to the Chiang régime, which,

Digitized by Google

under the circumstances, began to concentrate its efforts on the construction of public highways to link its territory with French Indo-China, Burma and Soviet territory. In connection with the construction of railways and public highways, special mention must be made of the fact that the Chiang regime, along with the progress of the construction work, obtained increased foreign capital and thus became more and more bound to certain foreign countries.

Development of New China

The China Affairs Board

A central institution to carry on the important work of aiding in the construction of the new China and of realizing a new order in East Asia was created on December 16, 1938 with the inauguration of the China Affairs Board. Need had been felt for a powerful administrative organ to direct the task of development in China, a task with which the very existence of Japan is allied and which naturally includes problems of the utmost importance.

Concrete plans for the creation of a central administrative organ had been seriously discussed by the Army, Navy and Foreign Departments. Early in October, 1938, the Cabinet formally decided on the establishment of the institution now known as the China Affairs Board, which came into being on December 16th upon the promulgation of Imperial Ordinances concerning the Organization of the China Affairs Board and of the Liaison Office of the China Affairs Board, and concerning Amendments on the Organization of the Foreign Office.

As an explanation of the purpose with which the Board was created, we quote here from the address delivered by the then Prime Minister Prince Konoé on the occasion of its inauguration. Prince Konoé stated:

"The ultimate objective of the present hostilities, as has been enunciated on various occasions, does not stop with victory in arms but rather lies in the reconstruction of China and the establishment of a new order in the Far East based on the principle of co-operation between Japan, Manchoukuo and China. The overthrow of the anti-Japanese, pro-Comintern Régime of Chiang Kai-shek must lead the people of China to recognize the rationality and justice of cooperating with Japan, politically, economically and culturally.

"In pursuance of this task the China Affairs Board has been created. The Board endeavours, on the one hand, to co-ordinate and unify the various forces at home directed toward the consummation of the achievements of the China Affair and, on the other, to keep in close touch through its Liaison Division with the actual developments in China. Creation of the China Affairs Board will enable the Government to conduct more efficiently the planning and execution of construction work in East Asia and will thereby hasten the attainment of the ultimate objective of the present conflict."

Thus, the China Affairs Board serves as a connecting link between the Government and the operations in China, presenting a united front in the prosecution of national policies. Created in connection with and existing for the duration of the China Affair, the new Board is presided over by the Prime Minister. Exclusive of purely diplomatic affairs, its business comprises (1) political, economic and cultural problems relating to the China Affair; (2) the study and investigation of governmental policies to be taken in regard to the matters coming under the above category; (3) supervision of the operations of the companies established under special laws for the purpose of doing business in China as well as the control of the business transactions in China by persons who are so engaged; (4) the maintenance of unity in the administrative affairs of the different Government Offices relating to China.

Accordingly, the activity of the Board covers a wide field, political, economic and cultural, in which is included the problems of co-operation with the new Governments in China, the supervision of the North China Development Company and the Central China Promotion Company and matters relating to the culture and welfare of the Chinese people. In its organization, the Board is divided into various Bureaus, besides the President's Secretariat, including the Political, Economic, Cultural and Technical Bureaus. The Prime Minister is the President ex officio and is assisted by the Foreign, Finance, Army and Navy Ministers as Vice-Presidents. The Director-General of the Board is Lieutenant-General Heisuke Yanagawa and under him are fifty officers and sixty clerks.

Digitized by Google

As the result of the taking over of cultural work in China by the China Affairs Board, the Bureau in the Foreign Office which hitherto had charge of this work has changed its name and will devote itself to international cultural affairs, excluding those in China. Other minor changes took place in the organizations of the Foreign Office and of the Department of Overseas Affairs.

As for the place where the Liaison Division of the China Affairs Board is to be established and the area within which it will function, these will be chosen and designated by the Prime Minister. It may be added that there is additionally a Liaison Committee whose duty it is to promote unity among the different Government Departments with reference to the undertakings of the China Affairs Board.

Rehabilitation and Reconstruction

It is a well-known fact that the Chinese people have long acquiesced in the oppressive rules of governments and have endured extortion and exploitation by war lords. With all the blessings of fertile land, their lives and existence have constantly been threatened. Once a civil war has broken out, fathers and brothers are taken for the armies, the products of their labour are relentlessly requisitioned and taxes are levied most exorbitantly; after the fighting, nothing remains but devastation over all the war areas. They have, in the past, experienced the hard lot of war refugees in seeking food and shelter in strange villages, towns and cities.

After the sweeping victories of the Imperial forces on all fronts the Chinese masses experienced nothing but sympathy, kindness and relief—things totally different from what they had expected: medical care for the sick, food for the hungry, shelter for the homeless. Thus, under the protection of the Japanese armies peace and order have been restored and energetic activities for reconstruction have been started amidst confusion and devastation. The fact that the Imperial Army is fighting not against the Chinese people but for emancipation has been brought home to their minds.

Activities for the enlightenment of Chinese masses have been taken up by the Enlightement and Rehabilitation Corps.

The functions of the corps are to enlighten the masses in the war areas concerning Japan's purposes, to persuade and help the refugees to return to their towns and villages, to extend relief to the suffering, and to assist the Chinese in establishing and maintaining peace and order in all localities. Futhermore, to assist in economic and cultural reconstruction is another important function of these soldiers of peace.

These soldiers of peace invariably follow the Imperial forces. Residents in the war areas where the Chinese troops stubbornly hold their lines are accustomed either to flee with the Chinese forces when they retreat or to seek refuge beforehand somewhere in the interior fearing that looting and other outrages will likely be committed by the retreating forces. Nothing but desolation, therefore, is to be found in towns and villages. The few figures to be seen are usually the aged or deformed or children who have lost their parents. Even these helpless people cannot be easily approached in order ple cannot be easily approached in order to that help and relief might be extended to them, because they have been inculcated by the Communists with the false story that the Japanese soldiers will slaughter even women and children. The first step in the activities of the soldiers of peace is to disarm the fears of the masses and win their confidence. The next step is to try to restore peace and order.

Camps for rufugees are set up for the homeless; food and food-stuffs are distributed among the hungry; medical attention is administered to the sick, and even measures for preventing epidemics are carried out as occasion demands.

Establishment of employment bureaus and publication of local newspapers are found effective in securing rehabilitation. Such natural and humane acts as giving candy to and playing with children and taking special care of the aged have worked for the winning of the confidence of the Chinese masses. For this type of humanistic activities many Japanese and Chinese women workers are offering self-sacrificing services.

Assisting in economic rehabilitation and reconstruction is a measure not only essential for the material life of the people in the new China but also one having vital bearing upon their morale. Activities which come under the functions of the Enlightenment and Rehabilitation Corps, though limited in scope and temporary in nature, are the promotion of circulation of money and resumption of agricultural and commercial activities among rehabilitated villagers. The organization of harvesting groups has been founded to encourage the return of farmers to their fields. As they are supplied with Sun flags, the farmers can be distinguished from

Digitized by Google

disguised bandits or remnants of Chinese troops. Protected thus against falling victim to bandit attacks and secure against Japanese fire, these returning farmers have gathered in their crops in many places. For the products of these farms, the establishment of markets has necessarily been promoted.

Assisting in cultural reconstruction is another essential function of the soldiers of peace. Through their endeavours the Chinese leaders who have been disillusioned with the policy anti-Japanism hitherto enforced and are awakened to the possibilities of Sino-Japanese collaboration have already commenced activities for constructing a new culture based not upon exaggerated, narrow nationalism and disastrous anti-Japanism but upon the ideal of the moral State and of a moral world order. This change in cultural principles has naturally given rise to a desire to know Japan and the Japanese language. Accordingly, not only in the Peking-Tientsin area but also in Tsinan and other cities enthusiasm for learning Japanese is running high. Four Japanese language schools with 3,000 students are being conducted in the city of Tsinan alone.

The grateful hearts of the Chinese masses toward the Imperial Army have taken expression in various forms in many places. Recently the commander of a Japanese unit was presented a tablet bearing a eulogy by the residents of Tehsien, Shantung Province. The Chinese have generally co-operated with Japanese troops in repairing roads and bridges, recruiting coolies, getting supplies and facilitating encampments.

Assisting in organization of "villages for caring for and protecting roads" is another important function of the Enlightenment and Rehabilitation Corps. These villages are organized by the Chinese living along the principal railway lines with a view to promoting interest in the movement for caring for and protecting roads, training leaders, and organizing and guiding junior and women's bands. Several of these villages have now been organized in districts under Japanese occupation; the members of the organization, or villagers, are required to serve daily in taking care of and protecting railways, highways and lines of communication. Besides, they are expected to sound alarms in case of bandit raids. In recompense for these services they are accorded the right of priority in protection by the authorities in case of danger. The villagers are further compensated by the supply of their wants, food-stuffs and other necessaries of life, seeds and young plants of superior quality. The establishment of village schools and other educational facilities are also offered to them.

Where these villages are organized, the villagers have gradually come to understand the true motives and intentions of the Japanese assistance and to respect the members of the Corps. Instances have been reported in which villagers sheltered Japanese workers in their homes from the raids of bandits. Though unarmed, these soldiers of peace have always been safe, freely and friendlily mingling with the masses.

Organization of young men's, boys' and women's bands for the purpose of training and preparation for future leadership has been successfully carried out. The most advanced band is one of boys organized at Shihkiachwang with a membership of several hundreds. These boys not only engage in menial work such as street sweeping but also assist in the work of enlightenment and rehabilitation. Their services in that town and in near-by villages have contributed materially toward realizing the ideal of Sino-Japanese collaboration.

Wherever the Japanese forces advance, Japan's soldiers of peace are busily occupied in the Yellow River basin, Shansi, Shensi and other provinces. Those at work, totally unarmed, as friends and advisers of the agrarian masses, particularly in districts behind the lines where remnants of defeated Chinese troops, bandits and Communists are rampant in disturbing peace and order, are really worthy of being called "soldiers of peace." Due, in a considerable degree, to their heroic and devoted activities, even in Shansi Province, the noted stronghold of Red China, the ideal of a moral order based upon Japanese-Manchoukuoan-Chinese collaboration has dawned. Thus a new China is emerging. Chinese youths who seek to master the Japanese language, Chinese children who are joyfully playing with Japanese soldiers, and Chinese labourers who are energetically working for construction of hope—these make up the picture of the new China, the real friendly neighbour of Japan.

Prior to the outbreak of the present Affair, school children of Tungkwanghsien used to sing:

> Stand up for our fatherland, sons of China!
> Wipe away our disgrace, compatriots!
> March forward, every one of you,
> To annihilate all Japanese;
> To kill only one of them means little.

Digitized by Google

But such a hymn of hatred is to be heard no longer. Instead, children are singing songs of joy and happiness, some of them in Japanese. Indeed, the present Affair, one of the greatest upheavals in modern China, regrettable as it is from the point of view of destruction of lives and property it entailed, has given the Chinese a new world and a new import to their national life.

Establishment of Central Companies

Two companies were established on November 7, 1938, for the economic development of North and Central China. For North China the Kita-Shina Kaihatsu Kabushiki Kaisha or North China Development Company is capitalized at ¥350,000,000, half of which is borne by the Japanese Government. The other company is the Naka-Shina Shinko Kabushiki Kaisha or Central China Promotion Company capitalized at ¥100,000,000, half of which is borne by the Japanese Government.

The North China Development Company commenced its business in 1938 with a paid-up capital of ¥99,319,000, under the presidency of Sonyu Ōtani, former Minister for Overseas Affairs, for the capitalization and supervision of business corporations engaged in transportation, communications, eléctricity, mining and salt enterprises in North China, and to carry on its own enterprises.

The Central China Promotion Company also started its business in 1938 with a paid-up capital of ¥31,382,000 under the presidency of Kenji Kodama, former president of the Yokohama Specie Bank, and is already capitalized for the establishment of 7 business corporations and 1 bank in Central China.

Conditions of North China

Prices Soar According to the investigations made by various circles the prices of commodities in North China are soaring. The index numbers of wholesale prices at Tientsin and retail prices at Tientsin and Peking are as follows:

INDEX NUMBER OF WHOLESALE PRICES AT TIENTSIN

(Base: 1926=100)

Year	General	Foodstuffs	Clothes	Metallic goods	Building material	Fuel	Miscellaneous
1931	122.55	114.39	117.03	145.34	116.88	139.43	132.35

THE CONSTITUTION

CHAPTER I

THE EMPEROR

ARTICLE I The Empire of Japan shall be reigned over and governed by a line of Emperors unbroken for ages eternal.

ARTICLE II The Imperial Throne shall be succeeded to by Imperial male descendants, according to the provisions of the Imperial House Law.

ARTICLE III The Emperor is sacred and inviolable.

ARTICLE IV The Emperor is the head of the Empire, combining in Himself the rights of sovereignty, and exercises them according to the provisions of the present Constitution.

ARTICLE V The Emperor exercises the legislative power with the consent of the Imperial Diet.

ARTICLE VI The Emperor gives sanction to laws, and orders them to be promulgated and executed.

ARTICLE VII The Emperor convokes the Imperial Diet, opens, closes and prorogues it, and dissolves the House of Representatives.

ARTICLE VIII The Emperor, in consequence of an urgent necessity to maintain public safety or to avert public calamities, issues, when the Imperial Diet is not sitting, Imperial Ordinances in the place of law.

Such Imperial Ordinances are to be laid before the Imperial Diet at its next session, and when the Diet does not approve the said Ordinances, the Government shall declare them to be invalid for the future.

ARTICLE IX The Emperor issues, or causes to be issued, the Ordinances necessary for the carrying out of the laws, or for the maintenance of the public peace and order, and for the promotion of the welfare of the subjects. But no Ordinance shall in any way alter any of the existing laws.

ARTICLE X The Emperor determines the organization of the different branches of the administration, and salaries of all civil and military officers, and appoints and dismisses the same. Exceptions especially provided for in the present Constitution or in other laws shall be in accordance with the respective provisions bearing thereon.

ARTICLE XI The Emperor has the supreme command of the Army and Navy.

ARTICLE XII The Emperor determines the organization and peace standing of the Army and Navy.

ARTICLE XIII The Emperor declares war, makes peace, and concludes treaties.

ARTICLE XIV The Emperor declares a state of siege.

The conditions and effects of a state of siege shall be determined by law.

ARTICLE XV The Emperor confers titles of nobitity, rank, orders and other marks of honour.

ARTICLE XVI The Emperor orders amnesty, pardon, commutation of punishments and rehabilitation.

ARTICLE XVII A Regency shall be instituted in conformity with the provisions of the Imperial House Law.

The Regent shall exercise the powers appertaining to the Emperor in His name.

CHAPTER II

RIGHTS AND DUTIES OF SUBJECTS

ARTICLE XVIII The conditions necessary for being a Japanese subject shall be determined by law.

ARTICLE XIX Japanese subjects may, according to qualifications determined in laws or ordinances, be appointed to civil or military or any other public offices equally.

ARTICLE XX Japanese subjects are amenable to service in the Army or Navy according to the provisions of law.

ARTICLE XXI Japanese subjects are amenable to the duty of paying taxes according to the provisions of law.

ARTICLE XXII Japanese subjects shall have the liberty of abode and of changing the same within the limits of law.

ARTICLE XXIII No Japanese subject shall be arrested, detained, tried or punished, unless according to law.

ARTICLE XXIV No Japanese subject shall be deprived of his right of being tried by the judges determined by law.

ARTICLE XXV Except in the cases provided for in the law, the house of no Japanese subject shall be entered or searched without his consent.

ARTICLE XXVI Except in the cases mentioned in the law, the secrecy of the

Digitized by Google

letters of every Japanese subject shall remain inviolate.

ARTICLE XXVII The right of property of every Japanese subject shall remain inviolate.

Measures necessary to be taken for the public benefit shall be provided for by law.

ARTICLE XXVIII Japanese subjects shall, within limits not prejudicial to peace and order, and not antagonistic to their duties as subjects, enjoy freedom of religious belief.

ARTICLE XXIX Japanese subjects shall, within the limits of law, enjoy the liberty of speech, writing, publication, public meetings and associations.

ARTICLE XXX Japanese subjects may present petitions, by observing the proper forms of respect, and by complying with the rules specially provided for the same.

ARTICLE XXXI The provisions contained in the present chapter shall not affect the exercise of the powers appertaining to the Emperor, in times of war or in cases of a national emergency.

ARTICLE XXXII Each and every one of the provisions contained in the preceding Articles of the present chapter, that are not in conflict with the laws or the rules and discipline of the Army and Navy, shall apply to the officers and men of the Army and of the Navy.

CHAPTER III

THE IMPERIAL DIET

ARTICLE XXXIII The Imperial Diet shall consist of two Houses, a House of Peers and a House of Representatives.

ARTICLE XXXIV The House of Peers shall, in accordance with the Ordinance concerning the House of Peers, be composed of the members of the Imperial Family, of the orders of nobility, and of those persons who have been nominated thereto by the Emperor.

ARTICLE XXXV The House of Representatives shall be composed of Members elected by the people according to the provisions of the Law of Election.

ARTICLE XXXVI No one can at one and the same time be a Member of both Houses.

ARTICLE XXXVII Every law requires the consent of the Imperial Diet.

ARTICLE XXXVIII Both Houses shall vote upon projects of law submitted to them by the Government, and may respectively initiate projects of law.

ARTICLE XXXIX A Bill which has been rejected by either the one or the other of the two Houses shall not be again brought in during the same session.

ARTICLE XL Both Houses can make representations to the Government as to laws or upon any other subject. When, however, such representations are not accepted, they cannot be made a second time during the same session.

ARTICLE XLI The Imperial Diet shall be convoked every year.

ARTICLE XLII A session of the Imperial Diet shall last during three months. In case of necessity, the duration of a session may be prolonged by Imperial Order.

ARTICLE XLIII When urgent necessity arises, an extraordinary session may be convoked in addition to the ordinary one.

The duration of an extraordinary session shall be determined by Imperial Order.

ARTICLE XLIV The opening, closing, prolongation of session and prorogation of the Imperial Diet, shall be effected simultaneously for both Houses.

In case the House of Representatives has been ordered to dissolve, the House of Peers shall at the same time be prorogued.

ARTICLE XLV When the House of Representatives has been ordered to dissolve, Members shall be caused by Imperial Order to be newly elected, and the new House shall be convoked within five months from the day of dissolution.

ARTICLE XLVI No debate can be opened and no vote can be taken in either House of the Imperial Diet, unless not less than one-third of the whole number of the Members thereof is present.

ARTICLE XLVII Votes shall be taken in both Houses by absolute majority. In the case of a tie vote, the President shall have the casting vote.

ARTICLE XLVIII The deliberations of both Houses shall be held in public. The deliberations may, however, upon demand of the Government or by resolution of the House, be held in secret sitting.

ARTICLE XLIX Both Houses of the Imperial Diet may respectively present addresses to the Emperor.

ARTICLE L Both Houses may receive petitions presented by subjects.

ARTICLE LI Both Houses may enact, besides what is provided for in the present Constitution and in the Law of the Houses, rules necessary for the management of their internal affairs.

ARTICLE LII No Member of either House shall be held responsible outside

Digitized by Google

the respective Houses for any opinion uttered or for any vote given in the House. When, however, a Member himself has given publicity to his opinions by public speech, by documents in print or in writing, or by any other similar means, he shall, in the matter, be amenable to the general law.

ARTICLE LIII The Members of both Houses shall, during the session, be free from arrest, unless with the consent of the House, except in cases of flagrant delicts, or of offences connected with a state of internal commotion or with a foreign trouble.

ARTICLE LIV The Ministers of State and the Delegates of the Government may, at any time, take seats and speak in either House.

CHAPTER IV

THE MINISTERS OF STATE AND THE PRIVY COUNCIL

ARTICLE LV The respective Ministers of State shall give their advice to the Emperor, and be responsible for it.

All Laws, Imperial Ordinances and Imperial Rescripts of whatever kind, that relate to the affairs of the State, require the countersignature of a Minister of State.

ARTICLE LVI The Privy Councillors shall, in accordance with the provisions for the organization of the Privy Council, deliberate upon important matters of State, when they have been consulted by the Emperor.

CHAPTER V

THE JUDICATURE

ARTICLE LVII The Judicature shall be exercised by the Courts of Law according to law, in the name of the Emperor.

The organization of the Courts of Law shall be determined by law.

ARTICLE LVIII The judges shall be appointed from among those who possess proper qualifications according to law.

No judge shall be deprived of his position, unless by way of criminal sentence or disciplinary punishment.

Rules for disciplinary punishment shall be determined by law.

ARTICLE LIX Trials and judgments of a Court shall be conducted publicly When, however, there exists any fear, that such publicity may be prejudicial to peace and order, or to the maintenance of public morality, the public trial may be suspended by provision of law or by the decision of the Court of Law.

ARTICLE LX All matters, that fall within the competency of a special Court, shall be specially provided for by law.

ARTICLE LXI No suit at law, which relates to rights alleged to have been infringed by the illegal measures of the administrative authorities, and which shall come within the competency of the Court of Administrative Litigation specially established by law, shall be taken cognizance of a Court of Law.

CHAPTER VI

FINANCE

ARTICLE LXII The imposition of a new tax or the modification of the rates of an existing one shall be determined by law.

However, all such administrative fees or other revenue having the nature of compensation shall not fall within the category of the above clause.

The raising of national loans and the contracting of other liabilities to the charge of the National Treasury, except those that are provided in the Budget, shall require the consent of the Imperial Diet.

ARTICLE LXIII The taxes levied at present shall, in so far as they are not remodelled by a new law, be collected according to the old system.

ARTICLE LXIV The expenditure and revenue of the State require the consent of the Imperial Diet by means of an annual Budget.

Any and all expenditures overpassing the appropriations set forth in the Titles and Paragraphs of the Budget, or that are not provided for in the Budget, shall subsequently require the approbation of the Imperial Diet.

ARTICLE LXV The Budget shall be first laid before the House of Representatives.

ARTICLE LXVI The expenditures of the Imperial House shall be defrayed every year out of the National Treasury, according to the present fixed amount for the same, and shall not require the consent thereto of the Imperial Diet, except in case an increase thereof is found necessary.

ARTICLE LXVII Those already fixed

Digitized by Google

expenditures based by the Constitution upon the powers appertaining to the Emperor, and such expenditures as may have arisen by the effect of law, or that appertain to the legal obligations of the Government, shall be neither rejected nor reduced by the Imperial Diet, without the concurrence of the Government.

ARTICLE LXVIII In order to meet special requirements, the Government may ask the consent of the Imperial Diet to a certain amount as a Continuing Expenditure Fund, for a previously fixed number of years.

ARTICLE LXIX In order to supply deficiencies, which are unavoidable, in the Budget, and to meet requirements unprovided for in the same, a Reserve Fund shall be provided in the Budget.

ARTICLE LXX When the Imperial Diet cannot be convoked, owing to the external or internal condition of the country, in case of urgent need for the maintenance of public safety, the Government may take all necessary financial measures, by means of an Imperial Ordinance.

In the case mentioned in the preceding clause, the matter shall be submitted to the Imperial Diet at its next session, and its approbation shall be obtained thereto.

ARTICLE LXXI When the Imperial Diet has not voted on the Budget, or when the Budget has not been brought into actual existence, the Government shall carry out the Budget of the preceding year.

ARTICLE LXXII The final account of the expenditures and revenue of the State shall be verified and confirmed by the Board of Audit, and it shall be submitted by the Government to the Imperial Diet, together with the report of verification of the said Board.

The organization and competency of the Board of Audit shall be determined by law separately.

CHAPTER VII

SUPPLEMENTARY RULES

ARTICLE LXXIII When it has become necessary in future to amend the provisions of the present Constitution, a project to that effect shall be submitted to the Imperial Diet by Imperial Order.

In the above case, neither House can open the debate, unless not less than two-thirds of the whole number of Members are present, and no amendment can be passed, unless a majority of not less than two-thirds of the Members present is obtained.

ARTICLE LXXIV No modification of the Imperial House Law shall be required to be submitted to the deliberation of the Imperial Diet.

No provision of the present Constitution can be modified by the Imperial House Law.

ARTICLE LXXV No modification can be introduced into the Constitution, or into the Imperial House Law, during the time of a Regency.

ARTICLE LXXVI Existing legal enactments, such as laws, regulations, Ordinances, or by whatever names they may be called, shall, so far as they do not conflict with the present Constitution, continue in force.

All existing contracts or orders, that entail obligations upon the Government, and that are connected with expenditure, shall come within the scope of Art. LXVII.

THE IMPERIAL HOUSE LAW

CHAPTER I

SUCCESSION TO THE IMPERIAL THRONE

ARTICLE I The Imperial Throne of Japan shall be secceeded to by male descendants in the male line of Imperial Ancestors.

ARTICLE II The Imperial Throne shall be succeeded to by the Imperial eldest son.

ARTICLE III When there is no Imperial eldest son, the Imperial Throne shall be succeeded to by the Imperial eldest grandson. When there is neither Imperial eldest son nor any male descendant of his, it shall be succeeded to by the Imperial son next in age, and so on in every successive case.

ARTICLE IV For succession to the Imperial Throne by an Imperial descendant, the one of full blood shall have precedence over descendants of half blood. The succession to the Imperial Throne by the latter shall be limited to those cases

Digitized by Google

only, when there is no Imperial descendant of full blood.

ARTICLE V When there is no Imperial descendant, the Imperial Throne shall be succeeded to by an Imperial brother and by his descendants.

ARTICLE VI When there is no such Imperial brother or desendant of his, the Imperial Throne shall be succeeded to by an Imperial uncle and by his descendants.

ARTICLE VII When there is neither such Imperial uncle nor descendant of his, the Imperial Throne shall be succeeded to by the next nearest member among the rest of the Imperial Family.

ARTICLE VIII Among the Imperial brothers and the remoter Imperial relations, precedence shall be given, in the same degree, to the descendants of full blood over those of half blood, and to the elder over the younger.

ARTICLE IX When the Imperial heir is suffering from an incurable disease of mind or body, or when any other weighty cause exists, the order of successiou may be changed in accordance with the foregoing provisions, with the advice of the Imperial Family Council and with that of the Privy Council.

CHAPTER II

ASCENSION AND CORONATION

ARTICLE X Upon the demise of the Emperor, the Imperial heir shall ascend the Throne, and shall aquire the Divine Treasures of the Imperial Ancestors.

ARTICLE XI The ceremonies of Coronation shall be performed and a Grand Coronation Banquet (Daijosai) shall be held at Kyoto.

ARTICLE XII Upon an ascension to the Throne, a new era shall be inaugurated, and the name of it shall remain unchanged during the whole reign, in agreement with the established rule of the 1st year of Meiji.

CHAPTER III

MAJORITY. INSTITUTION OF EMPRESS AND OF HEIR-APPARENT

ARTICLE XIII The Emperor, the Kotaishi and the Kotaison shall attain their majority at eighteen full years of age.

ARTICLE XIV Members of the Imperial Family, other than those mentioned in the preceding Article, shall attain their majority at twenty full years of age.

ARTICLE XV The son of the Emperor, who is Heir-apparent, shall be called "Kotaishi." In case there is no Kotaishi, the Imperial grandson, who is Heir-apparent, shall be called "Kotaison."

ARTICLE XVI The institution of Empress and that of Kotaishi or of Kotaison shall be proclaimed by an Imperial Rescript.

CHAPTER IV

STYLES OF ADDRESS

ARTICLE XVII The style of address for the Emperor, the Grand Empress Dowager, the Empress Dowager and of the Empress, shall be His, or Her or Your Majesty.

ARTICLE XVIII The Kotaishi and his consort, the Kotaison and his consort, the Imperial Princes and their consorts, the Imperial Princesses, the Princes and their consorts, and the Princesses shall be styled His, Her, Their, or Your Highness or Highnesses.

CHAPTER V

REGENCY

ARTICLE XIX When the Emperor is a minor, a Regency shall be instituted.

When He is prevented by some permanent cause from personally governing, a Regency shall be instituted, with the advice of the Imperial Family Council and with that of the Privy Council.

ARTICLE XX The Regency shall be assumed by the Kotaishi or the Kotaison, being of full age of majority.

ARTICLE XXI When there is neither Kotaishi nor Kotaison, or when the Kotaishi or the Kotaison has not yet arrived at his majority, the Regency shall be assumed in the following order :

1. An Imperial Prince or a Prince.
2. The Empress.
3. The Empress Dowager.
4. The Grand Empress Dowager.
5. An Imperial Princess or a Princess.

ARTICLE XXII In case the Regency is to be assumed from among the male members of the Imperial Family, it shall be done in agreement with the order of succession to the Imperial Throne. The same shall apply to the case of female

Digitized by Google

members of the Imperial Family.

ARTICLE XXIII A female member of the Imperial Family to assume the Regency shall be exclusively one who has no consort.

ARTICLE XXIV When, on account of the minority of the nearest related member of the Imperial Family, or for some other cause, another member has to assume the Regency, the latter shall not, upon the arrival at majority of the above mentioned nearest related member, or upon the disappearance of the aforesaid cause, resign his or her post in favour of any person other than of the Kotaishi or of the Kotaison.

ARTICLE XXV When a Regent or one who should become such, is suffering from an incurable disease of mind or body, or when any other weighty cause exists therefor, the order of the Regency may be changed, with the advice of the Imperial Family Council and with that of the Privy Council.

CHAPTER VI

THE IMPERIAL GOVERNOR

ARTICLE XXVI When the Emperor is a minor, an Imperial Governor shall be appointed to take charge of His bringing up and of His education.

ARTICLE XXVII In case no Imperial Governor has been nominated in the will of the preceding Emperor, the Regent shall appoint one, with the advice of the Imperial Family Council and with that of the Privy Council.

ARTICLE XXVIII Neither the Regent nor any of his descendants can be appointed Imperial Governor.

ARTICLE XXIX The Imperial Governor can not be removed from his post by the Regent, unless upon the advice of the Imperial Family Council and upon that of the Privy Council.

CHAPTER VII

THE IMPERIAL FAMILY

ARTICLE XXX The term "Imperial Family" shall include the Grand Empress Dowager, the Empress Dowager, the Empress, the Kotaishi and his consort, the Kotaison and his consort, the Imperial Princes and their consorts, the Imperial Princesses, the Princes and their consorts, and the Princesses.

ARTICLE XXXI From Imperial sons to Imperial great-great-grandsons, Imperial male descendants shall be called Imperial Princes; and from Imperial daughters to Imperial great-great-grand-daughters, Imperial female descendants shall be called Imperial Princesses. From the fifth generation downwards, they shall be called, male descendants, Princes, female ones, Princesses.

ARTICLE XXXII When the Imperial Throne is succeeded to by a member of a branch line, the title of Imperial Prince or Imperial Princess shall be specially granted to the Imperial brothers and sisters, being already Princes or Princesses.

ARTICLE XXXIII The births, namings, marriages and deaths in the Imperial Family shall be announced by the Minister of the Imperial Household.

ARTICLE XXXIV Genealogical and other records relating to the matters mentioned in the preceding Article shall be kept in the Imperial archives.

ARTICLE XXXV The members of the Imperial Family shall be under the control of the Emperor.

ARTICLE XXXVI When a Regency is instituted, the Regent shall exercise the power of control referred to in the preceding Article.

ARTICLE XXXVII When a member, male or female, of the Imperial Family is a minor and has been bereft of his or her father, the officials of the Imperial Court shall be ordered to take charge of his or her bringing up and education. Under certain circumstances, the Emperor may either approve the guardian chosen by his or her parent, or may nominate one.

ARTICLE XXXVIII The guardian of a member of the Imperial Family must be himself a member thereof and of age.

ARTICLE XXXIX Marriages of members of the Imperial Family shall be restricted to the circle of the Family, or to certain noble families specially approved by Imperial Order.

ARTICLE XL Marriages of the members of the Imperial Family shall be subject to the sanction of the Emperor.

ARTICLE XLI The Imperial writs sanctioning the marriages of members of the Imperial Family shall bear the countersignature of the Minister of the Imperial Household.

ARTICLE XLII No member of the Imperial Family can adopt any one as his son.

ARTICLE XLIII When a member of the Imperial Family wishes to travel beyond the boundaries of the Empire, he

Digitized by Google

shall first obtain the sanction of the Emperor,

ARTICLE XLIV A female member of the Imperial Family, who has married a subject, shall be excluded from membership of the Imperial Family. However, she may be allowed, by the special grace of the Emperor, to retain her title of Imperial Princess or of Princess, as the case may be.

CHAPTER VIII

IMPERIAL HEREDITARY ESTATES

ARTICLE XLV No landed or other property that has been fixed as the Imperial Hereditary Estates shall be divided up and alienated.

ARTICLE XLVI The landed and other property to be included in the Imperial Hereditary Estates shall be settled by Imperial writ with the advice of the Privy Council, and shall be announced by the Minister of the Imperial Household.

CHAPTER IX

EXPENDITURES OF THE IMPERIAL HOUSE

ARTICLE XLVII The expenditures of the Imperial House of all kinds shall be defrayed out of the National Treasury at a certain fixed amount.

ARTICLE XLVIII The estimates and audit of accounts of the expenditures of the Imperial House and all other rules of the kind shall be regulated by the Finance Regulations of the Imperial House.

CHAPTER X

LITIGATIONS. DISCIPLINARY RULES FOR THE MEMBERS OF THE IMPERIAL FAMILY

ARTICLE XLIX Litigation between members of the Imperial Family shall be decided by judicial functionaries specially designated by the Emperor to the Department of the Imperial Household, and execution issued, after Imperial sanction thereto has been obtained.

ARTICLE L Civil actions brought by private individuals against members of the Imperial Family, shall be decided in the Court of Appeal in Tokyo. Members of the Imperial Family shall, however, be represented by attorneys, and no personal attendance in the Court shall be done in agreement with the Court.

ARTICLE LI No member of the Imperial Family can be arrested, or summoned before a Court of Law, unless the sanction of the Emperor has been first obtained thereto.

ARTICLE LII When a member of the Imperial Family has committed an act derogatory to his (or her) dignity, or when he has exhibited disloyalty to the Imperial House, he shall, by way of disciplinary punishment and by order of the Emperor, be deprived of the whole or a part of the privileges belonging to him as a member of the Imperial Family, or shall be suspended therefrom.

ARTICLE LIII When a member of the Imperial Family acts in a way tending to the squandering of his (or her) property, he shall be pronounced incapable by the Emperor, prohibited from administering his property, and a manager shall be appointed therefor.

ARTICLE LIV The two foregoing Articles shall be enforced upon the advice of the Imperial Family Council.

CHAPTER XI

THE IMPERIAL FAMILY COUNCIL

ARTICLE LV The Imperial Family Council shall be composed of the male members of the Imperial Family, who have reached the age of majority. The Lord Keeper of the Privy Seal, the President of the Privy Council, the Minister of the Imperial Household, the Minister of State for Justice and the President of the Court of Cassation shall be ordered to take part in the deliberations of the Council.

ARTICLE LVI The Emperor personally presides over the meeting of the Imperial Family Council, or directs one of the members of the Imperial Family to do so.

CHAPTER XII

SUPPLEMENTARY RULES

ARTICLE LVII Those of the present members of the Imperial Family of the fifth generation and downwards, who have already been invested with the title of Imperial Prince, shall retain the same as heretofore.

ARTICLE LVIII The order of succes-

Digitized by Google

sion to the Imperial Throne shall in every case relate to the descendants of absolute lineage. There shall be no admission to this line of succession for any one, as a consequence of his being an adopted Imperial son, Koyushi or heir to a princely house.

ARTICLE LIX The grades of rank among the Imperial Princes, Imperial Princesses, Princes and Princesses shall be abolished.

ARTICLE LX The family rank of Imperial Princes and all usages conflicting with the present Law shall be abolished.

ARTICLE LXI The property, annual expenses and all other rules concerning the members of the Imperial Family shall be specially determined.

ARTICLE LXII When in the future it shall become necessary either to amend or make additions to the present Law, the matter shall be decided by the Emperor, with the advice of the Imperial Family Council, and with that of the Privy Council.

A SUPPLEMENT TO THE IMPERIAL HOUSE LAW

(February 11, 1907)

ARTICLE I A Prince may be granted a family name and be caused to join the order of nobility by Imperial Order or through a petition.

ARTICLE II A Prince may become, by obtaining the sanction of the Emperor, the successor to the headship of a noble family, or be adopted into a noble family, with the object of succeeding to its headship.

ARTICLE III The wife and direct descendants of a Prince, who has, in accordance with the two preceding Articles, become a subject, and the wives of such descendants, enter such subject's family. This rule does not apply, however, to females married to other members of the Imperial Family and the direct descendants of such females.

ARTICLE IV A member of the Imperial Family, who has been deprived of its privileges may, by Imperial order, be caused to descend to the status of subject.

ARTICLE V The cases provided for in Articles I, II, and IV (of the supplementary law) shall be subject to the advice of the Imperial Family Council and that of the Privy Council.

ARTICLE VI A member of the Imperial Family who has become a subject can not be restored into the Imperial Family.

ARTICLE VII Regulations relating the personal status and other rights and duties of members of the Imperial Family, shall be especially determined besides those prescribed in the present Law.

The regulations referred to in the preceding clause apply when a member of the Imperial Family and a private individual are parties to a matter, concerning which different rules are provided to apply to such parties respectively.

ARTICLE VIII Provisions in Laws and Ordinances, which are set down as applicable to members of the Imperial Family, shall be applicable only when there are no special provisions in the present Law or in Regulations that may be issued in conformity with the present Law.

A SUPPLEMENT TO THE IMPERIAL HOUSE LAW

(November 28, 1918)

A female member of the Imperial Family may marry a Prince of the principal House or of the branch Houses of the Ri Family.

TREATY OF COMMERCE AND NAVIGATION BETWEEN JAPAN AND THE UNITED STATES OF AMERICA

Signed at Washington, February, 1911

ARTICLE I The subjects or citizens of each of the High Contracting Parties shall have liberty to enter, travel and reside in the territories of the other to carry on trade, wholesale and retail, to own or lease and occupy houses, manufactories, warehouses and shops, to employ agents of their choice, to lease land for residential and commercial purposes, and generally to do anything incident to or necessary for trade upon the same terms as native subjects or citizens, submitting themselves to the laws and regulations there established.

They shall not be compelled, under any pretext whatever, to pay any charges or taxes other or higher than those that are or may be paid by native subjects or citizens.

The subjects or citizens of each of the High Contracting Parties shall receive, in the territories of the other, the most constant protection and security for their persons and property, and shall enjoy in this respect the same rights and privileges as are or may be granted to native subjects or citizens, on their submitting themselves to the conditions imposed upon the native subjects or citizens.

They shall, however, be exempt in the territories of the other from compulsory military service either on land or sea, in the regular forces, or in the national guard, or in the militia; from all contributions imposed in lieu of personal service, and from all forced loans or military exactions or contributions.

ARTICLE II The dwellings, warehouses, manufactories and shops of the subject or citizens of each of the High Contracting Parties in the territories of the other, and all premises appertaining thereto used for purposes of residence or commerce, shall be respected. It shall not be allowable to proceed to make a domiciliary visit to, or a search of, any such buildings and premises, or to examine or inspect books, papers or accounts, except under the conditions and with the forms prescribed by the laws, ordinances and regulations for nationals.

ARTICLE III Each of the High Contracting Parties may appoint Consuls-General, Consuls, Vice-Consuls, Deputy Consuls and Consular Agents in all ports, cities and places of the other, except in those where it may not be convenient to recognize such officers. This exception, however, shall not be made in regard to one of the Contracting Parties without being made likewise in regard to all other Powers.

Such Consuls General, Consuls, Vice Consuls, Deputy Consuls and Consular Agents having received exequaturs or other sufficient authorizations from the Government of the country to which they are appointed, shall, on condition of reciprocity, have the right to exercise the functions and to enjoy the exemptions and immunities which are or may hereafter be granted to the consular officers of the same rank of the most favoured nation. The Government issuing exequaturs or other authorizations may in its discretion cancel the same on communicating the reasons for which it thought proper to do so.

ARTICLE IV There shall be between the territories of the two High Contracting Parties reciprocal freedom of commerce and navigation. The subjects or citizens of each of the Contracting Parties, equally with the subjects or citizens of the most favored nation, shall have liberty freely to come with their ships and cargoes to all places, ports and rivers in the territories of the other which are or may be opened to foreign commerce, subject always to the laws of the country to which they thus come.

Digitized by Google

ARTICLE V The import duties on articles, the produce or manufacture of the territories of one of the High Contracting Parties, upon importation into the territories of the other, shall henceforth be regulated either by special arrangements between the two countries or by the internal legislation of each.

Neither Contracting Party shall impose any other or higher duties or charges on the exportation of any article to the territories of the other than are or may be payable on the exportation of the like article to any other foreign country.

Nor shall any prohibition be imposed by either country on the importation or exportation of any articles from or to the territories of the other which shall not equally extend to the like article imported from or exported or any other country. The last provision is not, however, applicable to prohibitions or restrictions maintained or imposed as sanitary measures or for purposes of protecting animals and useful plants.

ARTICLE VI The subjects or citizens of each of the High Contracting Parties shall enjoy in the territories of the other exemption from all transit duties and a perfect equality of treatment with native subjects or citizens in all that relates to warehousing, bounties, facilities and drawbacks.

ARTICLE VII Limited-liability and other companies and associations, commercial, industrial, and financial, already or hereafter to be organized in accordance with the laws of either High Contracting Party and domiciled in the territories of such Party, are authorized, in the territories of the other, to exercise their rights and appear in the courts either as plaintiffs or defendants, subject to the laws of such other Party.

The foregoing stipulation has no bearing upon the question whether a company or association organized in one of the two countries will or will not be permitted to transact its business or industry in the other, this permission remaining always subject to the laws and regulation enacted or established in the respective countries or in any part thereof.

ARTICLE VIII All articles which are or may be legally imported into the ports of either High Contracting Party from foreign countries in national vessels may likewise be imported into those in vessels of the other Contracting Party, without being liable to any other or higher duties or charges of whatever denomination than if such articles were imported in national vessels. Such reciprocal equality of treatment shall take effect without distinction, whether such articles come directly from the place of origin or from any other foreign place.

In the same manner, there shall be perfect equality of treatment in regard to exportation, so that the same export duties shall be paid, and the same bounties and drawbacks allowed, in the territories of each of the Contracting Parties on the exportation of any article which is or may be legally exported therefrom, whether such exportation shall take place in Japanese vessels or in vessels of the United States, and whatever may be the place of destination, whether a port of the other Party or of any third Power.

ARTICLE IX In all that the stationing, loading and unloading of vessels in the ports of the territories of the High Contracting Parties, no privileges shall be granted by either Party to national vessels which are not equally, in like cases, granted to the vessels of the other country; the intention of the Contracting Parties being that in these respects the respective vessels shall be treated on the footing of perfect equality.

ARTICLE X Merchant vessels navigating under the flag of Japan or that of the United States and carrying the papers required by their national laws to prove their nationality shall in the United States and in Japan be deemed to be vessels of Japan or of the United States, respectively.

ARTICLE XI No duties of tonnage, harbour, pilotage, lighthouse, quarantine, or other similar or corresponding duties of whatever denomination, levied in the name or for the profit of Government, public functionaries, private individuals, corporations or establishments of any kind shall be imposed in the ports of the territories of either country upon the vessls of the other which shall not equally, under the same conditions, be imposed on national vessels in general, or on vessels of the most favoured nation. Such equality of treatment shall apply reciprocally to the respective vessels from whatever place they may arrive and whatever may be their place of destination.

ARTICLE XII Vessels charged with performance of regular scheduled postal service of one of the High Contracting Parties, whether belonging to the State or subsidized by it for the purpose, shall enjoy, in the ports of the territories of the other, the same facilities, privileges and immunities as are granted to like vessels of the most favoured nation.

ARTICLE XIII The coasting trade of the High Contracting Parties is excepted

Digitized by Google

from the provisions of the present Treaty and shall be regulated according to the laws of Japan and the United States, respectively. It is however understood that the subjects or citizens of either Contracting Party shall enjoy in this respect most-favoured-nation treatment in the territories of the other.

A vessel of one of the Contracting Parties, laden in a foreign country with cargo destined for two or more ports of entry in the territories of the other, may discharge a portion of her cargo at one of the said ports, and, continuing her voyage to the other port or ports of destination, there discharge the remainder of her cargo, subject always to the laws, tariffs and customs regulations of the country of destination; and, in like manner and under the same reservation, the vessels of one of the Contracting Parties shall be permitted to load at several ports of the other for the same outward voyages.

ARTICLE XIV Except as otherwise expressly provided in this Treaty, the High Contracting Parties agree that, in all that concerns commerce and navigation, any privilege, favour or immunity which either Contracting Party has actually granted, or may hereafter grant, to the subjects or citizens of any other States shall be extended to the subjects or citizens of the other Contracting Party gratuitously, if the concession in favour of that other State shall have been gratuitous, and on the same or equivalent conditions, if the concession shall have been conditional.

ARTICLE XV The subjects or citizens of each of the High Contracting Parties shall enjoy in the territories of the other the same protection as native subjects or citizens in regard to patents, trade-marks and designs, upon fulfillment of the formalities prescribed by law.

ARTICLE XVI The present Treaty shall, from the date on which it enters into operation, supersede the Treaty of Commerce and Navigation dated the 22nd day of November, 1894; and from the same date the last-named Treaty shall cease to be binding.

ARTICLE XVII The present Treaty shall enter into operation on the 17th of July, 1911, and shall remain in force twelve years or until the expiration of six months from the date on which either of the Contracting Parties shall have given notice to the other of its intention to terminate the Treaty.

In case neither of the Contracting Parties shall have given notice to the other six months before the expiration of the said period of twelve years of its intention to terminate the Treaty, it shall continue operative until the expiration of six months from the date on which either Party shall have given such notice,

TREATY OF COMMERCE AND NAVIGATION BETWEEN JAPAN AND GREAT BRITAIN

Signed at London, April 3, 1911

ARTICLE I The Subjects of each of the High Contracting Parties shal have full liberty to enter, travel, and reside in the territories of the other, and, conforming themselves to the laws of the country—

1. Shall, in all that relates to travel and residence, be placed in all respects on the same footing as native subjects.

2. They shall have the right, equally with native subjects, to carry on their commerce and manufacture, and to trade in all kinds of merchandise of lawful commerce, either in person or by agents, singly or in partnerships with foreign or native subjects.

3. They shall in all that relates to the pursuit of their industries, callings, professions, and educational studies be placed in all respects on the same footing as the subjects or citizens of the most favoured nation.

4. They shall be permitted to own or hire and occupy houses, manufactories, warehouses, shops, and premises which may be necessary for them, and to lease land for residential, commercial, industrial, and other lawful purposes, in the same manner as native subjects.

5. They shall, on condition of reciprocity, be at full liberty to acquire and possess every description of property, movable or immovable, which the laws of the country permit or shall permit the subjects or citizens of any other foreign country to acquire and possess, subject always to the conditions and limitations prescribed in such laws. They may dispose of the same by sale, exchange, gift, marriage, testaments, or in any other manner, under the same conditions which are or shall be established with regard to native subjects. They shall also be permitted, on com-

Digitized by Google

pliance with the laws of the country, freely to export the proceeds of the sale of their property and their goods in general without being subjected as foreigners to other or higher duties than those to which subjects of the country would be liable under similar circumstances.

6. They shall enjoy constant and complete protection and security for their persons and property, shall have free and easy access to the Courts of Justice and other tribunals in pursuit and defence of their claims and rights; and shall have full liberty, equally with native subjects, to choose and employ lawyers and advocates to represent them before such Courts and tribunals; and generally shall have the same rights and privileges as native subjects in all that concerns the administration of justice.

7. They shall not be compelled to pay taxes, fees, charges, or contributions of any kind whatever, other or higher than those which are or may be paid by native subjects or the citizens of the most favoured nation.

8. And they shall enjoy a perfect equality of treatment with native subject in all that relates to facilities for warehousing under bond, bounties, and drawbacks.

ARTICLE II The subjects of each of the High Contracting Parties in the territories of the other shall be exempted from all compulsory military services, whether in the army, navy, national guard, or militia; and from all forced loans and military requisitions or contributions unless imposed on them equally with native subjects as owners, lessees, or occupiers of immovable property.

In the above respects the subjects of each of the High Contracting Parties shall not be accorded in the territories of the other less favourable treatment than that which is or may be accorded to subjects or citizens of the most favoured nation.

ARTICLE III The dwellings, ware-houses, manufactories, and shops of the subjects of each of the High Contracting Parties in the territories of the other, and all premises appertaining thereto used for lawful purposes, shall be respected. It shall not be allowable to proceed to make a domiciliary visit to, or a search of, any such buildings and premises, or to examine or inspect books, papers, or accounts, except under the conditions and with the forms presented by the laws for native subjects.

ARTICLE IV Each of the High Contracting Parties may appoint Consuls-General, Consuls, Vice-Consuls, and Consular Agents in all the ports, cities, and places of the other, except in those where it may not be convenient to recognize such officers. This exception, however, shall not be made in regard one of the High Contracting Parties without being made likewise in regard to all other Powers.

Such Consuls-General, Consuls, Vice-Consuls, and Consular Agents, having received exequaturs or other sufficient authorizations from the Government of the country to which they are appointed, shall have the right to exercise their functions, and to enjoy the privileges, exemptions, and immunities which are or may be granted to the Consular officers of the most favoured nation. The Government issuing exequaturs or other authorizations has the right in its discretion to cancel the same on explaining the reasons for which it thought proper to do so.

ARTICLE V In case of the death of a subject of one of the High Contracting Parties in the territories of the other, without leaving at the place of his decease any person entitled by the laws of his country to take charge of and administer the estate, the competent Consular officer of the State to which the deceased belonged shall, upon fulfilment of the necessary formalities, be empowered to take custody of and administer the estate in the manner and under the limitations prescribed by the law of the country in which the property of the deceased is situated.

The foregoing provision shall also apply in case of a subject of one of the High Contracting Parties dying outside the territories of the other, but possessing property therein, without leaving any person there entitled to take charge of and administer the estate.

It is understood that in all that concerns the administration of the estates of deceased persons, any right, privilege, favour, or immunity which either of the High Contracting Parties has actually granted, or may hereafter grant, to the Consular officers of any other foreign State shall be extended immediately and unconditionally to the Consular officers of the other High Contracting Party.

ARTICLE VI There shall be between the territories of the two High Contracting Parties reciprocal freedom of commerce and navigation. The subjects of each of the High Contracting Parties shall have liberty freely to come with their ships and cargoes to all places, ports, and rivers in the territories of the other, which are or may be opened to foreign commerce, and conforming themselves to the laws of the country to which they thus come, shall

enjoy the same rights, privileges, liberties, favours, immunities, and exemptions in matters of commerce and navigation as are or may be enjoyed by native subjects.

ARTICLE VII Articles, the produce or manufacture of the territories of one High Contracting Party, upon importation into the territories of the other, from whatever place arriving, shall enjoy the lowest rates of customs duty applicable to similar articles of any other foreign origin.

No prohibition or restriction shall be maintained or imposed on the importation of any article, the produce or manufacture of the territories of either of the High Contracting Parties, into the territories of the other, from whatever place arriving, which shall not equally extend to the importation of the like articles, being the produce or manufacture of any other foreign country. This provision is not applicable to the sanitary or other prohibitions occasioned by the necessity of securing the safety of persons, or of cattle, or of plants useful to agriculture.

ARTICLE VIII The articles, the produce or manufacture of the United Kingdom, enumerated in Part 1 of the Schedule annexed to this Treaty, shall not, on importation into Japan, be subjected to higher customs duties than those syecified in the Schedule.

The articles, the produce or manufacture of Japan, enumerated in Part 2 of the Schedule annexed to this Treaty, shall be free of duty on importation into the United Kingdom.

Provided that if at any time after the expiration of one year from the date this Treaty takes effect either of the High Contracting Parties desires to make a modification in the Schedule it may notify its desire to the other High Contracting Party, and thereupon negotiations for the purpose shall be entered into forthwith. If the negotiations are not brought to a satisfactory conclusion within six months from the date of notification, the High Contracting Party which gave the notification may, within one month, give six months' notice to abrogate the present Article, and on the expiration of such notice the present Article shall cease to have effect, without prejudice to the other stipulations of this Treaty.

ARTICLE IX Articles, the produce or manufacture of the territories of one of the High Contracting Parties, exported to the territories of the other, shall not be subjected on export to other or higher charges than those paid on the like articles exported to any other foreign country. Nor shall any prohibition or restriction be imposed on the exportation of any article from the territories of either of the two High Contracting Parties to the territories of the other which shall not equally extend to the exportation of the like article to any other foreign country.

ARTICLE X Articles, the produce or manufacture of the territories of one of the High Contracting Parties, passing in transit through the territories of the other, in conformity with the laws of the country, shall be reciprocally free from all transit duties, whether they pass direct, or whether during transit they are unloaded, warehoused, and reloaded.

ARTICLE XI No internal duties levied for the benefit of the State, local authorities, or corporations which affect, or may affect, the production, manufacture, or consumption of any article in the territories of the High Contracting Parties shall for any reason be a higher or more burdensome charge on articles, the produce or manufacture of the territories of the other, than on similar articles of native origin.

The produce or manufacture of the territories of either of the High Contracting Parities imported into the territories of the other, and intended for warehousing or transit, shall not be subjected to any internal duty.

ARTICLE XII Merchants and manufacturers, subjects of one of the High Contracting Parties, as well as merchants and manufacturers domiciled and exercising their commerce and industries in the territories of such party, may, in the territories of the other, either personally or by means of commercial travellers, make purchases or collect orders, with or without samples, and such merchants, manufacturers, and their commercial travellers, while so making purchases and collecting orders, shall, in the matter of taxation and facilities, enjoy the most-favoured-nation treatment.

Articles imported as samples for the purpose above mentioned shall, in each country, be temporarily admitted free of duty on compliance with the Customs regulations and formalities established to assure their re-exportation or the payment of the prescribed customs duties if not re-exported within the period allowed by law. But the foregoing privilege shall not extend to articles which, owing to their quantity or value, cannot be considered as samples, or which owing to their nature, could not be identified upon re-exportation. The determination of the question of the qualification of samples for duty-free admission rests in all cases exclusively with the competent authorities

ARTICLE V The import duties on articles, the produce or manufacture of the territories of one of the High Contracting Parties, upon importation into the territories of the other, shall henceforth be regulated either by special arrangements between the two countries or by the internal legislation of each.

Neither Contracting Party shall impose any other or higher duties or charges on the exportation of any article to the territories of the other than are or may be payable on the exportation of the like article to any other foreign country.

Nor shall any prohibition be imposed by either country on the importation or exportation of any articles from or to the territories of the other which shall not equally extend to the like article imported from or exported or any other country. The last provision is not, however, applicable to prohibitions or restrictions maintained or imposed as sanitary measures or for purposes of protecting animals and useful plants.

ARTICLE VI The subjects or citizens of each of the High Contracting Parties shall enjoy in the territories of the other exemption from all transit duties and a perfect equality of treatment with native subjects or citizens in all that relates to warehousing, bounties, facilities and drawbacks.

ARTICLE VII Limited-liability and other companies and associations, commercial, industrial, and financial, already or hereafter to be organized in accordance with the laws of either High Contracting Party and domiciled in the territories of such Party, are authorized, in the territories of the other, to exercise their rights and appear in the courts either as plaintiffs or defendants, subject to the laws of such other Party.

The foregoing stipulation has no bearing upon the question whether a company or association organized in one of the two countries will or will not be permitted to transact its business or industry in the other, this permission remaining always subject to the laws and regulation enacted or established in the respective countries or in any part thereof.

ARTICLE VIII All articles which are or may be legally imported into the ports of either High Contracting Party from foreign countries in national vessels may likewise be imported into those in vessels of the other Contracting Party, without being liable to any other or higher duties or charges of whatever denomination than if such articles were imported in national vessels. Such reciprocal equality of treatment shall take effect without distinction, whether such articles come directly from the place of origin or from any other foreign place.

In the same manner, there shall be perfect equality of treatment in regard to exportation, so that the same export duties shall be paid, and the same bounties and drawbacks allowed, in the territories of each of the Contracting Parties on the exportation of any article which is or may be legally exported therefrom, whether such exportation shall take place in Japanese vessels or in vessels of the United States, and whatever may be the place of destination, whether a port of the other Party or of any third Power.

ARTICLE IX In all that the stationing, loading and unloading of vessels in the ports of the territories of the High Contracting Parties, no privileges shall be granted by either Party to national vessels which are not equally, in like cases, granted to the vessels of the other country; the intention of the Contracting Parties being that in these respects the respective vessels shall be treated on the footing of perfect equality.

ARTICLE X Merchant vessels navigating under the flag of Japan or that of the United States and carrying the papers required by their national laws to prove their nationality shall in the United States and in Japan be deemed to be vessels of Japan or of the United States, respectively.

ARTICLE XI No duties of tonnage, harbour, pilotage, lighthouse, quarantine, or other similar or corresponding duties of whatever denomination, levied in the name or for the profit of Government, public functionaries, private individuals, corporations or establishments of any kind shall be imposed in the ports of the territories of either country upon the vessls of the other which shall not equally, under the same conditions, be imposed on national vessels in general, or on vessels of the most favoured nation. Such equality of treatment shall apply reciprocally to the respective vessels from whatever place they may arrive and whatever may be their place of destination.

ARTICLE XII Vessels charged with performance of regular scheduled postal service of one of the High Contracting Parties, whether belonging to the State or subsidized by it for the purpose, shall enjoy, in the ports of the territories of the other, the same facilities, privileges and immunities as are granted to like vessels of the most favoured nation.

ARTICLE XIII The coasting trade of the High Contracting Parties is excepted

Digitized by Google

desert from any ship belonging to either of the High Contracting Parties in the territorial waters of the other, the local authorities shall, within the limits of law, be bound to give every assistance in their power for the recovery of such deserter, on application to that effect being made to them by the competent Consular officer of the country to which the ship of the deserter may belong, accompanied by an assurance that all expenses connected therewith will be repaid.

It is understood that this stipulation shall not apply to the subjects of the country where the desertion takes place.

ARTICLE XXIII Any vessel of either of the High Contracting Parties which may be compelled, by stress of weather or by accident, to take shelter in a port of the other shall be at liberty to refit therein, to procure all necessary stores, and to put to sea again, without paying any dues other than such as would be payable in the like case by a national vessel. In case, however, the master of a merchant-vessel should be under the necessity of disposing of a part of his merchandise in order to defray the expenses, he shall be bound to conform to the Regulations and Tariffs of the place to which he may have come.

If any vessel of one of the High Contracting Parties should run aground or be wrecked upon the coasts of the other, such vessel, and all parts thereof, and all furniture and appurtenances belonging thereunto, and all goods and merchandise saved therefrom, including any which may have been cast into the sea, or the proceeds thereof, if sold, as well as all papers found on board such stranded or wrecked vessel, shall be given up to the owners or their agents when claimed by them. If there are no such owners or agents on the spot, then the same shall be delivered to the Japanese or British Consular officer in whose district the wreck or stranding may have taken place upon being claimed by him within the period fixed by the laws of the country, and such Consular officer, owners or agents shall pay only the expenses incurred in the preservation of the property together with the salvage or other expenses which would have been payable in the like case of a wreck or stranding of a national vessel.

The High Contracting Parties agree, moreover, that merchandise saved shall not be subjected to the payment of any customs duty unless cleared for internal consumption.

In the case either of a vessel being driven in by stress of weather, run aground, or wrecked, the respective Consular officers shall, if the owner or master or other agent of the owner is not present, or is present and requires it, be authorized to interpose in order to afford the necessary assistance to their fellow-country-men.

ARTICLE XXIV The High Contracting Parties agree that, in all that concerns commerce, navigation, and industry, any favour, privilege, or immunity which either High Contracting Party has actually granted, or may hereafter grant, to the ships, subjects, or citizens of any other foreign State shall be extended immediately and unconditionally to the ships or subjects of the other High Contracting Party, it being their intention that the commerce, navigation, and industry of each country shall be placed in all respects on the footing of the most favoured nation.

ARTICLE XXV The stipulations of this Treaty do not apply to tariff concessions granted by either of the High Contracting Parties to contiguous States solely to facilitate frontier traffic within a limited zone on each side of the frontier, or to the treatment accorded to the produce of the national fisheries of the High Contracting Parties, or to special tariff favours granted by Japan in regard to fish and other aquatic products taken in the foreign waters in the vicinity of Japan.

ARTICLE XXVI The stipulations of the present Treaty shall not be applicable to any of His Britannic Majesty's Dominions, Colonies, Possessions, or Protectorates, beyond the Seas, unless notice of adhesion shall have been given on behalf of any such Dominion, Colony, Possession, or Protectrate by His Britannic Majesty's Representative at Tokio before the expiration of two years from the date of the exchange of the ratification of the present Treaty.

ARTICLE XXVII The present Treaty shall be ratified, and the ratifications exchanged at Tokio as soon as possible. It shall enter into operation on the 17th July, 1911, and remain in force until the 16th July, 1923. In case neither of the High Contracting Parties shall have given notice to the other twelve months before the expiration of the said period, of its intention to terminate the Treaty, it shall continue operative until the expiration of one year from the date on which either of the High Contracting Parties shall have denounced it.

As regards the British Dominions, Colonies, Possessions, and Protectorates to which the present Treaty may have been made applicable in virtue of Article 26, however, either of the High Contracting Parties shall have the right to terminate it separately at any time on given twelve

pliance with the laws of the country, freely to export the proceeds of the sale of their property and their goods in general without being subjected as foreigners to other or higher duties than those to which subjects of the country would be liable under similar circumstances.

6. They shall enjoy constant and complete protection and security for their persons and property, shall have free and easy access to the Courts of Justice and other tribunals in pursuit and defence of their claims and rights; and shall have full liberty, equally with native subjects, to choose and employ lawyers and advocates to represent them before such Courts and tribunals; and generally shall have the same rights and privileges as native subjects in all that concerns the administration of justice.

7. They shall not be compelled to pay taxes, fees, charges, or contributions of any kind whatever, other or higher than those which are or may be paid by native subjects or the citizens of the most favoured nation.

8. And they shall enjoy a perfect equality of treatment with native subject in all that relates to facilities for warehousing under bond, bounties, and drawbacks.

ARTICLE II The subjects of each of the High Contracting Parties in the territories of the other shall be exempted from all compulsory military services, whether in the army, navy, national guard, or militia; and from all forced loans and military requisitions or contributions unless imposed on them equally with native subjects as owners, lessees, or occupiers of immovable property.

In the above respects the subjects of each of the High Contracting Parties shall not be accorded in the territories of the other less favourable treatment than that which is or may be accorded to subjects or citizens of the most favoured nation.

ARTICLE III The dwellings, ware-houses, manufactories, and shops of the subjects of each of the High Contracting Parties in the territories of the other, and all premises appertaining thereto used for lawful purposes, shall be respected. It shall not be allowable to proceed to make a domiciliary visit to, or a search of, any such buildings and premises, or to examine or inspect books, papers, or accounts, except under the conditions and with the forms presented by the laws for native subjects.

ARTICLE IV Each of the High Contracting Parties may appoint Consuls-General, Consuls, Vice-Consuls, and Consular Agents in all the ports, cities, and places of the other, except in those where it may not be convenient to recognize such officers. This exception, however, shall not be made in regard one of the High Contracting Parties without being made likewise in regard to all other Powers.

Such Consuls-General, Consuls, Vice-Consuls, and Consular Agents, having received exequaturs or other sufficient authorizations from the Government of the country to which they are appointed, shall have the right to exercise their functions, and to enjoy the privileges, exemptions, and immunities which are or may be granted to the Consular officers of the most favoured nation. The Government issuing exequaturs or other authorizations has the right in its discretion to cancel the same on explaining the reasons for which it thought proper to do so.

ARTICLE V In case of the death of a subject of one of the High Contracting Parties in the territories of the other, without leaving at the place of his decease any person entitled by the laws of his country to take charge of and administer the estate, the competent Consular officer of the State to which the deceased belonged shall, upon fulfilment of the necessary formalities, be empowered to take custody of and administer the estate in the manner and under the limitations prescribed by the law of the country in which the property of the deceased is situated.

The foregoing provision shall also apply in case of a subject of one of the High Contracting Parties dying outside the territories of the other, but possessing property therein, without leaving any person there entitled to take charge of and administer the estate.

It is understood that in all that concerns the administration of the estates of deceased persons, any right, privilege, favour, or immunity which either of the High Contracting Parties has actually granted, or may hereafter grant, to the Consular officers of any other foreign State shall be extended immediately and unconditionally to the Consular officers of the other High Contracting Party.

ARTICLE VI There shall be between the territories of the two High Contracting Parties reciprocal freedom of commerce and navigation. The subjects of each of the High Contracting Parties shall have liberty freely to come with their ships and cargoes to all places, ports, and rivers in the territories of the other, which are or may be opened to foreign commerce, and conforming themselves to the laws of the country to which they thus come, shall

enjoy the same rights, privileges, liberties, favours, immunities, and exemptions in matters of commerce and navigation as are or may be enjoyed by native subjects.

ARTICLE VII Articles, the produce or manufacture of the territories of one High Contracting Party, upon importation into the territories of the other, from whatever place arriving, shall enjoy the lowest rates of customs duty applicable to similar articles of any other foreign origin.

No prohibition or restriction shall be maintained or imposed on the importation of any article, the produce or manufacture of the territories of either of the High Contracting Parties, into the territories of the other, from whatever place arriving, which shall not equally extend to the importation of the like articles, being the produce or manufacture of any other foreign country. This provision is not applicable to the sanitary or other prohibitions occasioned by the necessity of securing the safety of persons, or of cattle, or of plants useful to agriculture.

ARTICLE VIII The articles, the produce or manufacture of the United Kingdom, enumerated in Part 1 of the Schedule annexed to this Treaty, shall not, on importation into Japan, be subjected to higher customs duties than those syecified in the Schedule.

The articles, the produce or manufacture of Japan, enumerated in Part 2 of the Schedule annexed to this Treaty, shall be free of duty on importation into the United Kingdom.

Provided that if at any time after the expiration of one year from the date this Treaty takes effect either of the High Contracting Parties desires to make a modification in the Schedule it may notify its desire to the other High Contracting Party, and thereupon negotiations for the purpose shall be entered into forthwith. If the negotiations are not brought to a satisfactory conclusion within six months from the date of notification, the High Contracting Party which gave the notification may, within one month, give six months' notice to abrogate the present Article, and on the expiration of such notice the present Article shall cease to have effect, without prejudice to the other stipulations of this Treaty.

ARTICLE IX Articles, the produce or manufacture of the territories of one of the High Contracting Parties, exported to the territories of the other, shall not be subjected on export to other or higher charges than those paid on the like articles exported to any other foreign country. Nor shall any prohibition or restriction be imposed on the exportation of any article from the territories of either of the two High Contracting Parties to the territories of the other which shall not equally extend to the exportation of the like article to any other foreign country.

ARTICLE X Articles, the produce or manufacture of the territories of one of the High Contracting Parties, passing in transit through the territories of the other, in conformity with the laws of the country, shall be reciprocally free from all transit duties, whether they pass direct, or whether during transit they are unloaded, warehoused, and reloaded.

ARTICLE XI No internal duties levied for the benefit of the State, local authorities, or corporations which affect, or may affect, the production, manufacture, or consumption of any article in the territories of the High Contracting Parties shall for any reason be a higher or more burdensome charge on articles, the produce or manufacture of the territories of the other, than on similar articles of native origin.

The produce or manufacture of the territories of either of the High Contracting Parities imported into the territories of the other, and intended for warehousing or transit, shall not be subjected to any internal duty.

ARTICLE XII Merchants and manufacturers, subjects of one of the High Contracting Parties, as well as merchants and manufacturers domiciled and exercising their commerce and industries in the territories of such party, may, in the territories of the other, either personally or by means of commercial travellers, make purchases or collect orders, with or without samples, and such merchants, manufacturers, and their commercial travellers, while so making purchases and collecting orders, shall, in the matter of taxation and facilities, enjoy the most-favoured-nation treatment.

Articles imported as samples for the purpose above mentioned shall, in each country, be temporarily admitted free of duty on compliance with the Customs regulations and formalities established to assure their re-exportation or the payment of the prescribed customs duties if not re-exported within the period allowed by law. But the foregoing privilege shall not extend to articles which, owing to their quantity or value, cannot be considered as samples, or which owing to their nature, could not be identified upon re-exportation. The determination of the question of the qualification of samples for duty-free admission rests in all cases exclusively with the competent authorities

niers se trouvant entre les mains de l'un des Gouvernements seront remis au Commissaire de l'autre Gouvernement, ou à son représentant dûment autorisé, qui les recevra en tel nombre et dans tels ports convenable de l'État remettant que ce dernier aurait notifié d'avance au Commissaire de l'État recevant.

Les Gouvernements du Japon et de Russie présenteront l'un à l'autre, le plus tôt possible après que la remise des prisonniers aura été achevée, un compte documenté des dépenses directes faites respectivement par eux pour le soin et l'entretien des prisonniers depuis la date de la captureou de la reddition jusqu'à celle de la mort ou de la remise. La Russie s'engage à rem bourser au Japon, aussitôt que possible après L'échange de ces comptes comme il est stipulé ci-dessus, la différence entre le montant réel ainsi dépensé par le Japon et le montant réel également déboursé, par la Russie.

THE CONVENTION EMBODYING BASIC RULES OF THE RELATIONS BETWEEN JAPAN AND THE UNION OF SOVIET SOCIALIST REPUBLICS

Signed at Peking, January 20, 1925

ARTICLE I The High Contracting Parties agree that with the coming into force of the present Convention, diplomatic and consular relations shall be established between them.

ARTICLE II The Union of Soviet Socialist Republics agrees that the Treaty of September 5th, 1905, shall remain in full force.

It is agreed that the Treaties, Conventions and Agreements, other than the said Treaty of Portsmouth, which were concluded between Japan and Russia prior to November 7, 1917, shall be re-examined at a Conference to be subsequently held between the Governments of the High Contracting Parties and are liable to revision or annulment as altered circumstances may require.

ARTICLE III The Governments of the High Contracting Parties agree that upon the coming into force of the present Convention, they shall proceed to the revision of the Fishery Convention of 1907, taking into considration such changes as may have taken place in the general conditions since the conclusion of the said Fishery Convention.

Pending the conclusion of a convention so revised, the Government of the Union of Soviet Socialist Republics shall maintain the practices established in 1924 relating to the lease of fishery lots to Japanese subjects.

ARTICLE IV The Governments of the High Contracting Parties agree that upon the coming into force of the present Convention, they shall proceed to the conclusion of a treaty of commerce and navigation in conformity with the principles hereunder mentioned, and that pending the conclusion of such a treaty, the general intercourse between the two countries shall be regulated by those principles.

(1) The subjects or citizens of each of the High Contracting Parties shall in accordance with the laws of the country: a / have liberty to enter, travel and reside in the territories of the other, and b / enjoy constant and complete protection for the safety of their lives and property.

(2) Each of the High Contracting Parties shall in accordance with the laws of the country accord in its territories to the subjects or citizens of the other, to the widest possible extent and on condition of reciprocity, the right of private ownership and the liberty to engage in commerce, navigation, industries, and other peaceful pursuits.

(3) Without prejudice to the right of each Contracting Party to regulate by its own laws the system of international trade in that country, it is understood that neither Contracting Party shall apply in discrimination against the other Party any measures of prohibition, restriction or impost which may serve to hamper the growth of the intercourse, economic or otherwise, between the two countries, it being the intention of both Parties to place the commerce, navigation and industry of each country, as far as possible, on the footing of the most favoured nation.

The Governments of the High Contracting Parties further agree that they shall enter into negotiations, from time to time as circumstances may require, for the conclusion of special arrangements relative to commerce and navigation to adjust ond to promote economic relations between the two countries.

Digitized by Google

desert from any ship belonging to either of the High Contracting Parties in the territorial waters of the other, the local authorities shall, within the limits of law, be bound to give every assistance in their power for the recovery of such deserter, on application to that effect being made to them by the competent Consular officer of the country to which the ship of the deserter may belong, accompanied by an assurance that all expenses connected therewith will be repaid.

It is understood that this stipulation shall not apply to the subjects of the country where the desertion takes place.

ARTICLE XXIII Any vessel of either of the High Contracting Parties which may be compelled, by stress of weather or by accident, to take shelter in a port of the other shall be at liberty to refit therein, to procure all necessary stores, and to put to sea again, without paying any dues other than such as would be payable in the like case by a national vessel. In case, however, the master of a merchant-vessel should be under the necessity of disposing of a part of his merchandise in order to defray the expenses, he shall be bound to conform to the Regulations and Tariffs of the place to which he may have come.

If any vessel of one of the High Contracting Parties should run aground or be wrecked upon the coasts of the other, such vessel, and all parts thereof, and all furniture and appurtenances belonging thereunto, and all goods and merchandise saved therefrom, including any which may have been cast into the sea, or the proceeds thereof, if sold, as well as all papers found on board such stranded or wrecked vessel, shall be given up to the owners or their agents when claimed by them. If there are no such owners or agents on the spot, then the same shall be delivered to the Japanese or British Consular officer in whose district the wreck or stranding may have taken place upon being claimed by him within the period fixed by the laws of the country, and such Consular officer, owners or agents shall pay only the expenses incurred in the preservation of the property together with the salvage or other expenses which would have been payable in the like case of a wreck or stranding of a national vessel.

The High Contracting Parties agree, moreover, that merchandise saved shall not be subjected to the payment of any customs duty unless cleared for internal consumption.

In the case either of a vessel being driven in by stress of weather, run aground, or wrecked, the respective Consular officers shall, if the owner or master or other agent of the owner is not present, or is present and requires it, be authorized to interpose in order to afford the necessary assistance to their fellow-country-men.

ARTICLE XXIV The High Contracting Parties agree that, in all that concerns commerce, navigation, and industry, any favour, privilege, or immunity which either High Contracting Party has actually granted, or may hereafter grant, to the ships, subjects, or citizens of any other foreign State shall be extended immediately and unconditionally to the ships or subjects of the other High Contracting Party, it being their intention that the commerce, navigation, and industry of each country shall be placed in all respects on the footing of the most favoured nation.

ARTICLE XXV The stipulations of this Treaty do not apply to tariff concessions granted by either of the High Contracting Parties to contiguous States solely to facilitate frontier traffic within a limited zone on each side of the frontier, or to the treatment accorded to the produce of the national fisheries of the High Contracting Parties, or to special tariff favours granted by Japan in regard to fish and other aquatic products taken in the foreign waters in the vicinity of Japan.

ARTICLE XXVI The stipulations of the present Treaty shall not be applicable to any of His Britannic Majesty's Dominions, Colonies, Possessions, or Protectorates, beyond the Seas, unless notice of adhesion shall have been given on behalf of any such Dominion, Colony, Possession, or Protectrate by His Britannic Majesty's Representative at Tokio before the expiration of two years from the date of the exchange of the ratification of the present Treaty.

ARTICLE XXVII The present Treaty shall be ratified, and the ratifications exchanged at Tokio as soon as possible. It shall enter into operation on the 17th July, 1911, and remain in force until the 16th July, 1923. In case neither of the High Contracting Parties shall have given notice to the other twelve months before the expiration of the said period, of its intention to terminate the Treaty, it shall continue operative until the expiration of one year from the date on which either of the High Contracting Parties shall have denounced it.

As regards the British Dominions, Colonies, Possessions, and Protectorates to which the present Treaty may have been made applicable in virtue of Article 26, however, either of the High Contracting Parties shall have the right to terminate it separately at any time on given twelve

Digitized by Google

months' notice to that effect. It is understood that the stipulations of the present and of the preceding Article referring to British Dominions, Colonies, Possessions, and Protectorates apply also to the island of Cyprus.

TRAITÉ DE PAIX ENTRE LE JAPON ET LA RUSSIE

Signé á Portsmouth, en français et anglais, le 5 septembre, 1905 (38éme année de Meiji)

ARTICLE I

Il y aura à l'avenir paix et amitié entre Leurs Majestés l'Empereur du Japon et l'Empereur de toutes les Russies, ainsi qu'entre Leurs Etats et sujets respectifs.

ARTICLE II

Le Gouvernement Impérial de Russie, reconnaissant que le Japon possède en Corée des intérêts prédominants politiques, militaires et économiques, s'engage à ne point intervenir ni mettre d'obstacles aux mesures de direction, de protection et de controle que le Gouvernement Impérial du Japon pourrait considérer nécessaire de prendre en Corée.

Il est entendu que les subjects russes en Corée seront traités exa ctement de la même manière que les ressortissants des autres pays étrangers, à savoir qu'ils seront placés sur le même pied que les ressortissants de la nation la plus favorisée.

Il est de même convenu que pour éviter toute cause de malentendu, les deux Hautes Parties Contractantes s'abstiendront, sur la frontière russocoréenne, de prendre toute mesure militaire qui pourrait menacer la sécurité du territoire russe ou coréen.

ARTICLE III

Le Japon et la Russie s'engagent mutuellement:

1. A évacuer complètement et simultanément la Manchourie à l'exception du territoire sur lequel s'étend le bail de la presqu'île de Liaotung, conformément aux disposition de Liaotung, conformément aux dispositions de l'Article additionnel 1 annexé à ce Traité; et

2. A restituer entièrement et complètement à l'administration exclusive de la Chine toutes les parties de la Manchourie qui sont occupées maintenant par les troupes japonaises ou russes ou qui sont sous leur controle, à l'exception du territoire susmentionné.

Le Gouvernement Impérial de Russie déclare qu'il n'a point en Manchourie d'avantages territoriaux ou concessions préférentielles ou exclusives de nature à porter atteinte à la souveraineté de la Chine ou incompatibles avec le principe d'opportunité égale.

ARTICLE IV

Le Japon et la Russie s'engagent réciproquement à ne mettre aucun obstacle aux mesures générales qui s'appliquent également à toutes les nations et que la Chine pourrait prendre pour le développement du commerce et de l'industrie en Manchourie.

ARTICLE V

Le Gouvernement Impérial de Russie cède au Gouvernement Impérial du Japon avec le consentement du Gouvernement de Chine, le bail de Port Arthur, de Talien et des territoires et eaux territoriales adjacents, ainsi que tous les droits, privilèges et concessions se rattachant à ce bail ou en faisant partie, et il cède de même, au Gouvernement Impérial du Japon, oust les travaux et propriétés publics dans le territoire sur lequel s'étend le bail susmentionné.

Les deux Hautes Parties Contractantes s'engagent mutuellement à obtenir du Gouvernement de Chine le consentement mentionné dans la stipulation ci-dessus.

Le Gouvernement Impérial du Japon donne, de sa part, l'assurance que les droits de propriété des sujets russes dans le territoire susmentionné seront parfaitement respectés.

ARTICLE VI

Le Gouvernement Impérial de Russie s'engage à céder au Gouvernement Impérial du Japon, sans compensation, avec

Digitized by Google

le consentement du Gouvernement de Chine, le chemin de fer entre Tchan-Tchoun (Kouan-Tchen-Tsy) et Port Arthur et tous ses embranchements avec tous les droits, privilèges et propriétés y appartenant dans cette région, ainsi que toutes les mines de charbon dans ladite région, appartenant à ce chemin de fer ou en exploitation pour son profit.

Les deux Hautes Parties Contractantes s'engagent mutuellement à obtenir du Gouvernement de Chine le consentement mentionné dans la stipulation ci-dessus.

ARTICLE VII

Le Japon et la Russie s'engagent à exploiter leurs chemins de fer respectifs en Manchourie exclusivement dans un but commercial et industrial, mais nullement dans un but stratégique.

Il est entendu que cette restriction ne s'applique pas aux chemins de fer dans le territoire sur lequel s'étend le bail de la presqu'île de Liaotung.

ARTICLE VIII

Les Gouvernments Impériaux du Japon et de Russie, en vue de favoriser et de faciliter les relations et le traffic, concluront, aussitot que possible, une convention séparée pour le règlement de leurs services de raccordement de chemins de fer en Manchourie.

ARTICLE VIX

Le Gouvernement Impérial de Russie céde au Gouvernement Impérial du Japon en perpétuité et en pleine souveraineté la partie sud de l'île de Sahnaline et toutes les îles qui y sont adjacentes, ainsi que tous les travaux et propriétés publics qui s'y trouvent. Le cinquantième parallèle de latitude nord est adopté comme la limite du territoire cédé. La ligne frontière exacte de ce territoire sera détérminée conformément aux dispositions de l'Article additionnel 2 annexé à ce Traité.

Le Japon et la Russie conviennent mutuellement de ne construire dans leurs possessions respectives sur l'île de Sakhaline et sur les îles qui y sont adjacentes aucune fortification ni travaux militaires semblables. De même, ils s engagent respectivement à ne prendre aucune mesure militaire qui pourrait entraver la libre navigation des Détroits de La Pérpose et de Tartarie.

ARTICLE X

Il est réservé aux sujets russes habitants du territoire cédé au Japon de vendre leurs propriétés immobilières et de se retirer dans leur pays; mais, s'ils, préfèrent rester dans le territoire cédé, ils seront maintenus et protégés dans le plein exercice de leurs industries et droits de propriété à la condition de se soumettre aux lois et à la jurisdiction japonaises. Le Japon aura la pleine liberté de retirer le droit de résidence dans ce territoire à tous les habitants se trouvant dans l'incapacité politique ou administrative, ou de les déporter de ce territoire. Il s'engage toutefois à ce que les droits de propriété de ces habitants soient pleinement respectés.

ARTICLE XI

La Russie s'engage à s'entendre avec le Japon pour concéder aux sujets japonais des droits de pêche le long des cotes des possessions russes dans les Mers du Japon, d'Okhotsk et de Behring.

Il est convenu que l'engagement susmentionné ne portera pas atteinte aux droits déjà appartenant aux sujets russes ou étrangers dans ces régions.

ARTICLE XII

Le Traité de Commerce et de Navigation entre le Japon et la Russie ayant été annulé par la guerre, les Gouvernements Impériaux du Japon et de Russie s'engagent à adopter comme base de leurs relation commercials, jusqu'à la conclusion d'un nouveau traité de commerce et de navigation sur la base du Traité qui était en vigueur antérieurement à la guerre actuelle, le système du traitement réciproque sur le pied de la nation la plus favorisée, y compris les tarifs d'importation, et d'exportation, les formalités de douane, les droits de transit et de tonnage et l'addmission et le traitement des agents, des sujets et des vaissaux d'un pays dans le territoire de l'autre.

ARTICLE XIII

Aussitôt que possible après la mise en vigueur du présent Traité, tous les prisonniers de guerre seront réciproquement restitués. Les Gouvernements Impériaux du Japon et de Russie nommeront, chacun de son coté, un Commissaire spécial qui se chargera des prisonniers. Tous les prison-

Digitized by Google

niers se trouvant entre les mains de l'un des Gouvernements seront remis au Commissaire de l'autre Gouvernement, ou à son représentant dûment autorisé, qui les recevra en tel nombre et dans tels ports convenable de l'État remettant que ce dernier aurait notifié d'avance au Commissaire de l'État recevant.

Les Gouvernements du Japon et de Russie présenteront l'un à l'autre, le plus tôt possible après que la remise des prisonniers aura été achevée, un compte documenté des dépenses directes faites respectivement par eux pour le soin et l'entretien des prisonniers depuis la date de la captureou de la reddition jusqu'à celle de la mort ou de la remise. La Russie s'engage à rem bourser au Japon, aussitôt que possible après L'échange de ces comptes comme il est stipulé cidessus, la différence entre le montant réel ainsi dépensé par le Japon et le montant réel également déboursé, par la Russie.

THE CONVENTION EMBODYING BASIC RULES OF THE RELATIONS BETWEEN JAPAN AND THE UNION OF SOVIET SOCIALIST REPUBLICS

Signed at Peking, January 20, 1925

ARTICLE I The High Contracting Parties agree that with the coming into force of the present Convention, diplomatic and consular relations shall be established between them.

ARTICLE II The Union of Soviet Socialist Republics agrees that the Treaty of September 5th, 1905, shall remain in full force.

It is agreed that the Treaties, Conventions and Agreements, other than the said Treaty of Portsmouth, which were concluded between Japan and Russia prior to November 7, 1917, shall be re-examined at a Conference to be subsequently held between the Governments of the High Contracting Parties and are liable to revision or annulment as altered circumstances may require.

ARTICLE III The Governments of the High Contracting Parties agree that upon the coming into force of the present Convention, they shall proceed to the revision of the Fishery Convention of 1907, taking into considration such changes as may have taken place in the general conditions since the conclusion of the said Fishery Convention.

Pending the conclusion of a convention so revised, the Government of the Union of Soviet Socialist Republics shall maintain the practices established in 1924 relating to the lease of fishery lots to Japanese subjects.

ARTICLE IV The Governments of the High Contracting Parties agree that upon the coming into force of the present Convention, they shall proceed to the conclusion of a treaty of commerce and navigation in conformity with the principles hereunder mentioned, and that pending the conclusion of such a treaty, the general intercourse between the two countries shall be regulated by those principles.

(1) The subjects or citizens of each of the High Contracting Parties shall in accordance with the laws of the country: a / have liberty to enter, travel and reside in the territories of the other, and b / enjoy constant and complete protection for the safety of their lives and property.

(2) Each of the High Contracting Parties shall in accordance with the laws of the country accord in its territories to the subjects or citizens of the other, to the widest possible extent and on condition of reciprocity, the right of private ownership and the liberty to engage in commerce, navigation, industries, and other peaceful pursuits.

(3) Without prejudice to the right of each Contracting Party to regulate by its own laws the system of international trade in that country, it is understood that neither Contracting Party shall apply in discrimination against the other Party any measures of prohibition, restriction or impost which may serve to hamper the growth of the intercourse, economic or otherwise, between the two countries, it being the intention of both Parties to place the commerce, navigation and industry of each country, as far as possible, on the footing of the most favoured nation.

The Governments of the High Contracting Parties further agree that they shall enter into negotiations, from time to time as circumstances may require, for the conclusion of special arrangements relative to commerce and navigation to adjust ond to promote economic relations between the two countries.

Digitized by Google

ARTICLE V The High Contracting Parties solemnly affirm their desire and intention to live in peace and amity with each other, scrupulously to respect the undoubted right of a State to order its own life within its own jurisdiction in its own way, to refrain and restrain all persons in any governmental service for them, and all organizations in receipt of any financial assistance from them, from any act overt or covert liable in any way whatever to endanger the order and security in any part of the territories of Japan or the Union of Soviet Socialist Republics.

It is further agreed that neither Contracting Party shall permit the presence in the territories under its jurisdiction—(a) of organizations or groups pretending to be the Government for any part of the territories of the other Party, or (b) of alien subjects or citizens who may be found to be actually carrying on political activities for such organizations or groups.

ARTICLE VI In the interest of promoting economic relations between the two countries, and taking into consideration the needs of Japan with regard to natural resources, the Government of the Union of Soviet Socialist Republics is willing to grant to Japanese subjects, companies and associations concessions for the exploitation of minerals, forest and other natural resources in all the territories of the Union of Soviet Socialist Republics.

ARTICLE VII The present Convention shall be ratified.

Such ratification by each of the High Contracting Parties shall, with as little delay as possible, be communicated through its diplomatic representative at Peking, to the Government of the other Party, and from the date of the letter of such communications this Convention shall come into full force.

CONVENTION DE COMMERCE ET DE NAVIGATION ENTRE LE JAPON ET LA FRANCE

Signé à Paris, le 19 août, 1911

ARTICLE PREMIER

Les ressortissants de chacune des Hautes Parties Contractantes auront pleine liberté, avec leurs familles, d'entrer et de séjourner dans toute l'étendue des territoires de l'autre. Sous la condition de se conformer aux lois du pays, ils jouiront des droits ci-après spécifiés:

1 Ils seront, en ce qui concerne le voyage et la résidence, traités sous tous rapports comme les nationaux;

2 Ils auront, comme les nationaux, le droit de se livrer au commerce ou à l'industrie manufacturière et de faire le trafic de tous articles de commerce licite, soit en personne, soit par des représentants, soit seuls, soit en association avec des étrangers ou des nationaux;

3 Ils seront, en ce qui concerne l'exercice de leur industrie, métier ou profession, la poursuite de leurs études ou investigations scientifiques, traités à tous égards, comme les ressortissants de la nation la plus favorisée;

4 Ils pourront posséder ou louer et occuper les maisons, les manufactures, les magasins, les boutiques et les locaux qui peuvent leur être nécessaires et prendre à bail des terrains l'effet d'y résider ou de les utiliser dans un but licite commercial, industriel, manufacturier ou autre;

5 Ils pourront, sous la condition de la réciprocité, librement acquérir et posséder toute espèce de propriété mobilière ou immobilière, que la loi du pays permet ou permettra d'acquérir ou de posséder aux ressortissants de tout autre pays étranger. Ils pourront en disposer par voie de vente, échange, donation, mariage, testament, ou de toute autre manière sous les mêmes conditions qui sont ou seront établies à l'égard des nationaux eux-mêmes. Ils pourront aussi exporter librement le produit des ventes de leurs propriétés et tout ce qui leur appartient en général, sans pouvoir être soumis en tant qu'étrangers, à des droits autres ou plus élevés que ceux auxquels seraient soumis les nationaux dans les mêmes circonstances;

6 Ils jouiront d'une protection et sécurité constantes et complètes, pour leurs personnes et leurs propriétés; ils auront un accès libre et facile auprès des cours et tribunaux de justice pour la poursuite et la défense de leurs droits, et ils seront, en outre, comme les nationaux eux-mêmes, libres de choisir et d'employer des avocats, avoués et autres hommes de loi pour les représenter devant les cours et

Digitized by Google

tribunaux, et d'une manière générale ils auront les mêmes droits et privilèges que les nationaux pour tout ce qui concerne l'administration de la justice;

7 Ils seront exempts de tout service militaire obligatoire, soit dans l'armée de terre ou de mer, soit dans la garde nationale ou la milice, ainsi que de toutes les contributions imposées en lieu et place du service personnel. Ils seront exempts également de tous emprunts forcés et de toutes réquisitions ou contributions militaires, sauf ceux qui leur seront imposés, comme aux nationaux eux-mêmes, en leur qualité de possesseurs, locataires ou occupants de biens immeubles. Pour ce qui précède, les ressortissants de chacune des Hautes Parties Contractantes ne seront pas traités sur les territoires de l'autre moins bien que ne le sont ou ne le seront les ressortissants de la nation la plus favorisée;

8 Ils ne seront contraints à subir des charges ou à payer des impôts, taxes ou contributions, de quelque nature que ce soit, autres ou plus élevés que ceux qui sont ou pourront être imposés aux nationaux ou ressortissants de la nation la plus favorisée.

ARTICLE II

Les habitations, magasins, manufactures et boutiques des ressortissants de chacune des Hautes Parties Contractantes dans les territoires de l'autre, ainsi que tous les locaux qui en dépendent, employés pour des buts licites, seront respectés. Il ne sera point permis d'y procéder à des visites domiciliaires ou perquisitions, non plus que d'examiner ou d'inspecter les livres, papiers ou comptes, sauf dans les conditions et formes prescrites par les lois à l'égard des nationaux eux-mêmes.

ARTICLE III

Les ressortissants des Parties Contractantes jouiront de la liberté réciproque de commerce, et de navigation; ils auront, de la même facon que les ressortissants de la nation la plus favorisée, plein liberté de se rendre avec leurs navires et leurs cargaisons dans les lieux, ports et rivières des territoires de l'autre, qui sont ou pourront être ouverts au commerce extérieur; ils bénéficieront, en se conformant toujours aux lois du pays où ils arrivent, des mêmes droits, faveurs, libertés, immunités et exemptions en matière de commerce et de navigation, dont bénéficient ou bénéficieraient les nationaux eux-mêmes.

ARTICLE IV

Les sociétés anonymes ou autres et les associations commerciales, industrielles et financières qui sont ou seront constituées conformément aux lois de l'une des Parties Contractantes et qui ont leur domicile dans les territoires de cette Partie, sont autorisées, dans les territoires de l'autre, en se conformant aux lois de celle-ci, à exercer leurs droits et à ester en justice devant les tribunaux, soit pour intenter une action, soit pour y défendre.

ARTICLE V

Les droits de douane percus à l'entrée au Japon et en France sur les produits de l'autre pays ne pourront être autres ou plus élevés que ceux imposés aux produits similaires originaires du pays le plus favorisé.

Les droits percus à la sortie du Japon et de France sur les produits destinés à l'autre pays ne pourront également être autres ou plus élevés que ceux imposés aus mêmes produits destinés au pays le plus favorisé.

ARTICLE VI

Les Parties Contractantes s'engagent à n'entraver nullement le commerce réciproque des deux pays par des prohibitions ou restrictions à l'importation, à l'exportation ou au transit.

Des exceptions à cette règle, en tant qu'elles seront applicables à tous les pays ou aux pays se trouvant dans les mêmes conditions, ne pourront avoir lieu que dans les cas suivants:

1 Pour les approvisionnements et munitions de guerre, dans des circonstances extraordinaires;

2 Pour des raisons de sûreté publique;

3 Par égard à la police sanitaire ou en vue de la protection des animaux ou des plantes utiles contre les maladies ou les insectes et parasites nuisibles;

4 En vue de l'application aux marchandises étrangères des prohibitions ou restrictions édictées par des lois intérieure des marchandises similaires ou de la vente ou du transport à l'intérieur des marchandises similaires de la production nationale;

5 Pour les marchandises qui sont ou seront l'objet d'un monopole d'Etat.

Digitized by Google

ment ou indirectement indiqué comme pays ou comme lieu d'origine, sera saisi à l'importation à la requête des autorités douanières ou ministère public où d'une partie intéresée, si la législation de chaque Pays Contractant l'admet, ou bien, à défaut, sera soumis aux actions et moyens assurés en pareil cas par la loi aux nationaux.

ARTICLE XVII

Les Hautes Parties Contractantes conviennent que, pour tout ce qui concerne le commerce, l'industrie et la navigation, tout privilège, faveur ou immunité quelconque, que l'une d'elles a déjà accordés ou accorderait à l'avenir au commerce, à l'industrie et à la naqigation de tout autre État, seront étendus immédiatement et sans condition, au commerce, à l'industrie et à la navigation de l'autre Partie Contoractante, leur intention étant que le commerce, l'industrie et la navigation de chaque pays jouissent sous tous rapports du traitement de la nation la plus favorisée.

ARTICLE XVIII

Les stipulations de la présente Convention ne sont pas applicables:

1 Aux avantages particuliers actuellement accordés ou qui pourraient être ultérieurement accordés par l'une des Parties Contractantes à des États limitrophes pour faciliter le trafic frontière;

2 Aux faveurs spéciales résultant d'une union douanière;

3 Aux pêches assimilées à la pêche nationale;

4 Aux encouragements accordés ou qui pourraient être accordés à la marine marchande nationale.

ARTICLE XIX

Les dispositions de la présente Convention sont applicables à l'Algérie. Elles pourront être ultérieurement étendues en tout ou partie aux colonies, possessions françaises et pays de protectorat par une déclaration concertée entre les deux gouvernments.

Il est entendu en outre que la présente Convention est applicable à toutes les colonies et possessions du Japon.

ARTICLE XX

La présente Convention sera ratifiée et l'échange des ratifications aura lieu à Tokyo; les ratifications seront notifiées dans le plus bref délai possible aux Gouvernments du Japon et de la France par leurs Représentants respectifs; à partir de la date de la dernière de ces deux notifications, la présente Convention entrera en vigueur et demeurera exécutoire pendant une période de dix années.

Toutefois, l'article 5 en vertu duquel les droits de douane perçus en France sur les produits d'origine japonaise et au Japon sur les produits d'origine française ne seront autres ou plus élevés que ceux perçus sur les produits similaires originaires du pays le plus favorisé, pourra être dénoncé à toute époque par chacune des deux Parties Contractantes, et dans ce cas, il cessera d'être exécutoire un an après cette dénonciation.

Au cas où douze mois avant la date d'expiration de la présente Convention aucune des deux Parties Contractantes n'aurait notifié son intention d'en faire cesser les effets, cet acte demeurera obligatoire jusqu'à l'expiration d'une année à partir du jour où l'une ou l'autre Partie Contractante l'aura dénoncé.

TRAITÉ DE COMMERCE ET DE NAVIGATION ENTER LE JAPON ET L'ALLEMAGNE

Signé à Berlin, le 24 Juin, 1911

ARTICLE I

Les ressortissants de chacune des Hautes Parties Contractantes auront pleine liberté d'entrer et de séjourner en tout lieu des territoires de l'autre.

A condition de se conformer aux lois du Pays, ils jouiront des droits spécifiés ci-dessous:

1. Ils seront, pour tout ce qui concerne la résidence, les études et investigations, l'exercice de leurs métiers et professions et l'exécution de leurs entreprises industrielles et manufacturières, placés, à tous égards, sur le même pied que les res-

Digitized by Google

sortissants de la nation la plus favorisée;

2. Ils auront, comme les nationaux eux-mêmes, le droit de voyager dans toute l'étendue des territoires de l'autre et le droit de faire le trafic de tous articles de commerce licite;

3. Ils pourront posséder ou louer et occuper des maisons, fabriques, magasins, boutiques et les locaux qui en dépendent. De même ils pourront louer des terrains à l'effet d'y résider ou de les utiliser dans un but licite commercial, industriel, manufacturier ou autre;

4. En ce qui concerne la possession de biens mobiliers de quelque espèce que ce soit, la transmission, par succession testamentaire ou autre, des biens mobiliers de toute sorte qu'ils peuvent légalement acquérir entre vivants et en ce qui concerne le droit de disposer, de quelque manière que ce soit, des biens de toute sorte qu'ils auront acquis légalement, ils jouiront des mêmes privilèges, libertés et droits et ne seront soumis, sous ce rapport, à aucuns impots ou charges plus élevés que les nationaux ou les ressortissants de la nation la plus favorisée;

5. Ils pourront, sous la réserve de la réciprocité, acquérir et posséder toute sorte dimmeubles qui, d'après les lois du Pays, peuvent ou pourront être acquis ou possédés par les ressortissants d'une autre nation étrangère quelconque, en se conformant toujours aux conditions et restrictions prescrites par lesdites lois;

6. Ils seront exempts de tout service militaire obligatoire, soit dans l'armée ou la marine, la garde nationale ou la milice, de même que de toutes taxes imposées en lieu et place du service personnel et de tous emprunts forcés. Ils ne pourront être assujettis à des réquisitions ou contributions militaires, quelles qu'elles soient, autrement que dans les mêmes conditions et sur le même pied que les nationaux ou les ressortissants de la nation la plus favorisée;

7. Ils ne seront contraints, sous aucun prétexte, à subir des charges ou à payer des taxes autres ou plus élevées que celles qui sont ou seront imposées aux nationaux ou aux ressortissants de la nation la plus favorisée.

ARTICLE II

Les habitations, magasins, fabriques et boutiques des ressortissants de chacune des Hautes Parties Contractantes dans les territoires de l'autre ainsi que tous les lacaux qui en dépendent, seront respectée. Il ne sera point permis d'y procéder à des visites domiciliaires ou perquisitions ou d'examiner ou d'inspecter les livres, papiers ou comptes, sauf dans les conditions et formes prescrites par les lois à l'égard des nationaux.

ARTICLE III

Il y aura entre les territoires des deux Hautes Parties Contractantes liberté réciproque de commerce et de navigation.

Les ressortissants de chacune des Hautes Parties Contractantes auront pleine liberté de se rendre avec leurs navires et leurs cargaisons dans les lieux, ports et rivières des territoires de l'autre qui sont ou pourront être ouverts au commerce extérieur; ils sont, toutefois, tenus de se conformer toujours aux lois du Pays où ils arrivent.

ARTICLE IV

Les droits de douane perçus sur les articles, produits naturels ou fabriqués des territoires de l'une des Hautes Parties Contractantes, à leur importation dans les territoires de l'autre, seront réglés, soit par des arrangements spéciaux entre les deux Pays, soit par la législation intérieure de chacun d'eux.

Aucune des Parties Contractantes n'imposera à l'exportation d'un article quelconque à destination des territoires de l'autre des droits ou charges quelconques autres ou plus élevés que ceux qui sont ou pourront être imposés à l'exportation des articles similaires à destination de tout autre pays étranger.

ARTICLE V

Les Hautes Parties Contractantes s'engagent à n'entraver leurs relations commerciales réciproques par aucune prohibition d'importation, d'exportation ni de transit.

Des exception pourront toutefois être faites dans les cas suivants, en tant qu'elles sont appliquées à tous les autres pays ou du moins à tous les pays qui se trouvent dans les mêmes conditions:

1. Relativement aux approvisionnements de guerre, dans des circonstances exceptionnelles;

2. Pour des considérations affectant la sécurité publique;

3. Pour cause de salubrité publique et en vne d'assurer la protection des animaux et des plantes utiles contre les maladies et les parasites;

Digitized by Google

4. Dans le but d'appliquer à des marchandises étrangères des interdictions ou des restrictions établies par la législation intérieure à l'égard de la production, du placement ou du trafic de marchandises indigènes de même nature.

ARTICLE VI

Les ressortissants de chacune des Hautes Parties Contractantes jouiront, dans les territoires de l'autre, d'une parfaite égalité de traitement avec les nationaux, quant à l'exemption de droits de transit et pour tout ce qui concerne le magasinage, les primes, les drawbacks ainsique les facilités touchant l'importation ou l'exportation des marchandises.

ARTICLE VII

Les négociants et les industriels que, par l'exhibition d'une carte de légitimation industrielle, délivrée par les autorités de l'une des Parties Contractantes, prouvent qu'ils sont autorisés à exercer leur commerce ou industrie dans les territoires de cette Partie, pourront, dans les territoires de l'autre, soit en personne, soit par des commis voyageurs, faire des achats ou recueillir des commandes, avec ou sans échantillons. Ces négociants, industriels et leurs commis voyageurs, en faisant ainsi des achats et en recueillant des commandes, jouiront, en matière d'impositions et de facilités du traitement de la nation la plus favorisée.

Les Parties Contractantes se donneront réciproquement connaissance des autorités chargées de délivrer les cartes de légitimation.

Les articles importés comme échantillons dans les buts mentionnés dans l'alinéa 1 seront, dans chacun des deux Pays, admis temporairement en franchise de droit, en conformité des règlements et formalités de douane, établis pour assurer leur réexportation ou le payement des droits de douane prescrits en cas de non-réexportation dans le délai prévu par la loi. Toutefois, ledit privilège ne s'étendra pas aux articles qui, à cause de leur quantité ou valeur, ne peuvent pas être considérés comme échantillons, ou qui, à cause de leur nature, ne sauraient être identifiés lors de leur réexportation. Le droit de décider si un échantillon est susceptible d'admission en franchise, appartient exclusivement dans tous les cas, aux autorités compétentes du lieu ou l'importation a été effectuée.

ARTICLE VIII

Les marques de reconnaissance, estampilles ou cachets apposés au moment de l'exportation par les autorités douanières de l'une des Parties Contractantes aux échantillons mentionnés dans l'article précédent ainsi que la liste de ces échantillons qui est officiellement attestée par elles et en contient la description détaillée, seront réciproquement acceptés par les autorités douanières de l'autre pour établir leur caractère d'échantillons et leur assurer l'exemption de toute inspection, sauf en tant que cette dernière est nécessaire pour constater que les échantillons présentés sont identiques avec ceux énumérés dans la liste. Les autorités douanières de chacune des Parties Contractantes pourront toutefois apposer une marque supplémentaire aux échantillons dans les cas spéciaux où elles jugent nécessaire de prendre cette précaution.

ARTICLE IX

Les sociétés par actions (anonymes) et autres sociétés et associations commerciales, industrielles ou financières, y compris les compagnies d'assurance, domiciliées dans les territoires de l'une des Parties Contractantes et ayant l'existence légale d'après les lois qui y sont en vigueur, seront reconnues comme ayant l'existence légale dans les territoires de l'autre et autorisées à y ester en justice devant les tribunaux, soit pour intenter une action, soit pour y défendre d'après les lois de cette autre Partie.

Leur admission à l'exercice de leur industrie ou de leur commerce ainsi qu'à l'acquisition de biens dans les territoires de l'autre Partie se règle d'après les prescriptions qui y sont en vigueur. En tout cas, lesdites sociétés, associations et compagnies jouiront, dans ces territoires, des mêmes droits que ceux qui sont ou pourront être accordés à des sociétés, associations et compagnies similaires de la nation la plus favorisée.

ARTICLE X

Tous les articles qui sont of pourront être légalement importés, dans les ports de l'une des Hautes Parties Contractantes, par des navires nationaux, pourront, de même, être importés dans ces ports par des navires de l'autre Partie Contractante, sans être soumis à aucuns droits ou charges, de quelque dénomination que ce soit,

Digitized by Google

des Parties Contractantes, à l'exportation d'un article quelconque qui peut ou pourra en être légalment exporté, que cette exportation se fasse par des navires japonais ou par des navires français et quel que soit le lieu de destination, soit un port de l'autre Partie, soit un port d'une tierce Puissance.

ARTICLE XI

En tout ce qui concerne le placement des navires, leur chargement, leur décharge ment dans les eaux territoriales des Parties Contractantes, il ne sera accordé, par l'une des Parties, aux navires nationaux, aucun privilège, ni aucune facilité qui ne le soit également, en pareil cas, aux navires de l'autre Pays, la volonté des Parties Contractantes étant que, sous ces rapports, leurs bâtiments respectifs jouissent d'une parfaite égalité.

ARTICLE XII

Les navires marchands naviguant sous pavillon japonais et français et ayant à bord les documents requis par leurs lois nationales pour établir leur nationalité, seront respectivement considérés, en France et au Japon, comme navires japonais et français.

ARTICLE XIII

Aucun droit de tonnage, de transit, de canal, de port, de pilotage, de phare, de quarantaine ou autres droits ou charges similaires ou analogues, de quelque dénomination que ce soit, levés-au nom ou au profit du gouvernement, de fonctionnaires publics, de particuliers, de corporations ou d'établissements quelconques, ne seront imposés dans les eaux territoriales de l'un des deux Pays sur les navires de l'autre sans qu'ils soient également imposés, dans les mêmes conditions, sur les navires nationaux en général, ou sur les navires de la nation la plus favorisée. Cette égalité de traitement sera appliquée réciproquement à leurs navires respectifs, de quelque endroit qu'ils arrivent et quel que soit le lieu de destination.

ARTICLE XIV

Les navires chargés d'un service postal régulier de l'une des Parties Contractantes qu'ils appartieunent à l'État ou à une compagnie subventionnée par lui à cet effet, jouiront dans les eaux territoriales de l'autre, des mêmes facilités, privilèges et immunités que ceux qui sont accordés aux navires similaires de la nation la plus favorisée.

ARTICLE XV

Il est fait exception aux dispositions de la présente Convention pour le cabotage dont le régime reste soumis à la législation du Japon et de la France respectivement; il est entendu toutefois, que les Japonais en France et les Français au Japon, jouiront pour tout ce qui concerne le cabotage, des droits et privilèges qui sont ou seront accordés par cette même législation aux ressortissants de la nation la plus favorisée.

Tout navire de l'une des Parties Contractantes, chargé à l'étranger d'une cargaison destinée à deux ou plusieurs ports d'entrée des territoires de l'autre, pourra décharger une partie de sa cargaison dans l'un desdits ports, et en continuant son voyage pour l'autre ou les autres ports de destination, y décharger le reste de sa cargaison, toujours en se conformant aux lois, aux tarifs et aux règlements de douane du pays de destination. De la même manière, et sous la même restriction, tout navire de l'une des Parties Contractantes pourra charger dans les divers ports de l'autre, au cours du même voyage pour l'étranger.

ARTICLE XVI

Les deux Hautes Parties Contractantes déclarent qu'elles sont adhérentes à la Convention d'Union de Paris du 20 mars 1883 pour la protection de la propriété industrielle; dans le cas où l'une d'entre elles cesserait d'adhérer à la Convention précitée, elles conviennent des stipulations suivantes:

Les ressortissants de chacune des Parties Contractantes jouiront, dans les territoires de l'autre Partie, des mêmes droits que les nationaux eux-mêmes, pour tout ce qui concerne la protection des brevets d'invention, des marques de fabrique ou de commerce, des dessins et modèles industriels et de fabrication de toute espèce, et noms commerciaux, et des indications de provenance, et pour tout ce qui concerne la répression de la concurrence déloyale, sous réserve de l'accomplissement des formalités et des conditions imposées par la loi.

Tout produit portant une fausse indication de provenance dans laquelle un des Pays Contractants, ou un lieu situé sur les territoires de l'un d'eux, serait directe-

Digitized by Google

ment ou indirectement indiqué comme pays ou comme lieu d'origine, sera saisi à l'importation à la requête des autorités douanières ou ministère public où d'une partie intéresée, si la législation de chaque Pays Contractant l'admet, ou bien, à défaut, sera soumis aux actions et moyens assurés en pareil cas par la loi aux nationaux.

ARTICLE XVII

Les Hautes Parties Contractantes conviennent que, pour tout ce qui concerne le commerce, l'industrie et la navigation, tout privilège, faveur ou immunité quelconque, que l'une d'elles a déjà accordés ou accorderait à l'avenir au commerce, à l'industrie et à la naqigation de tout autre État, seront étendus immédiatement et sans condition, au commerce, à l'industrie et à la navigation de l'autre Partie Contoractante, leur intention étant que le commerce, l'industrie et la navigation de chaque pays jouissent sous tous rapports du traitement de la nation la plus favorisée.

ARTICLE XVIII

Les stipulations de la présente Convention ne sont pas applicables:

1 Aux avantages particuliers actuellement accordés ou qui pourraient être ultérieurement accordés par l'une des Parties Contractantes à des États limitrophes pour faciliter le trafic frontière;

2 Aux faveurs spéciales résultant d'une union douanière;

3 Aux pêches assimilées à la pêche nationale;

4 Aux encouragements accordés ou qui pourraient être accordés à la marine marchande nationale.

ARTICLE XIX

Les dispositions de la présente Convention sont applicables à l'Algérie. Elles pourront être ultérieurement étendues en tout ou partie aux colonies, possessions françaises et pays de protectorat par une déclaration concertée entre les deux gouvernments.

Il est entendu en outre que la présente Convention est applicable à toutes les colonies et possessions du Japon.

ARTICLE XX

La présente Convention sera ratifiée et l'échange des ratifications aura lieu à Tokyo; les ratifications seront notifiées dans le plus bref délai possible aux Gouvernments du Japon et de la France par leurs Représentants respectifs; à partir de la date de la dernière de ces deux notifications, la présente Convention entrera en vigueur et demeurera exécutoire pendant une période de dix années.

Toutefois, l'article 5 en vertu duquel les droits de douane perçus en France sur les produits d'origine japonaise et au Japon sur les produits d'origine française ne seront autres ou plus élevés que ceux perçus sur les produits similaires originaires du pays le plus favorisé, pourra être dénoncé à toute époque par chacune des deux Parties Contractantes, et dans ce cas, il cessera d'être exécutoire un an après cette dénonciation.

Au cas où douze mois avant la date d'expiration de la présente Convention aucune des deux Parties Contractantes n'aurait notifié son intention d'en faire cesser les effets, cet acte demeurera obligatoire jusqu'à l'expiration d'une année à partir du jour où l'une ou l'autre Partie Contractante l'aura dénoncé.

TRAITÉ DE COMMERCE ET DE NAVIGATION ENTER LE JAPON ET L'ALLEMAGNE

Signé à Berlin, le 24 Juin, 1911

ARTICLE I

Les ressortissants de chacune des Hautes Parties Contractantes auront pleine liberté d'entrer et de séjourner en tout lieu des territoires de l'autre.

A condition de se conformer aux lois du Pays, ils jouiront des droits spécifiés ci-dessous:

1. Ils seront, pour tout ce qui concerne la résidence, les études et investigations, l'exercice de leurs métiers et professions et l'exécution de leurs entreprises industrielles et manufacturières, placés, à tous égards, sur le même pied que les res-

Digitized by Google

sortissants de la nation la plus favorisée;

2. Ils auront, comme les nationaux eux-mêmes, le droit de voyager dans toute l'étendue des territoires de l'autre et le droit de faire le trafic de tous articles de commerce licite;

3. Ils pourront posséder ou louer et occuper des maisons, fabriques, magasins, boutiques et les locaux qui en dépendent. De même ils pourront louer des terrains à l'effet d'y résider ou de les utiliser dans un but licite commercial, industriel, manufacturier ou autre;

4. En ce qui concerne la possession de biens mobiliers de quelque espèce que ce soit, la transmission, par succession testamentaire ou autre, des biens mobiliers de toute sorte qu'ils peuvent légalement acquérir entre vivants et en ce qui concerne le droit de disposer, de quelque manière que ce soit, des biens de toute sorte qu'ils auront acquis légalement, ils jouiront des mêmes privilèges, libertés et droits et ne seront soumis, sous ce rapport, à aucuns impots ou charges plus élevés que les nationaux ou les ressortissants de la nation la plus favorisée;

5. Ils pourront, sous la réserve de la réciprocité, acquérir et posséder toute sorte dimmeubles qui, d'après les lois du Pays, peuvent ou pourront être acquis ou possédés par les ressortissants d'une autre nation étrangère quelconque, en se conformant toujours aux conditions et restrictions prescrites par lesdites lois;

6. Ils seront exempts de tout service militaire obligatoire, soit dans l'armée ou la marine, la garde nationale ou la milice, de même que de toutes taxes imposées en lieu et place du service personnel et de tous emprunts forcés. Ils ne pourront être assujettis à des réquisitions ou contributions militaires, quelles qu'elles soient, autrement que dans les mêmes conditions et sur le même pied que les nationaux ou les ressortissants de la nation la plus favorisée;

7. Ils ne seront contraints, sous aucun prétexte, à subir des charges ou à payer des taxes autres ou plus élevées que celles qui sont ou seront imposées aux nationaux ou aux ressortissants de la nation la plus favorisée.

ARTICLE II

Les habitations, magasins, fabriques et boutiques des ressortissants de chacune des Hautes Parties Contractantes dans les territoires de l'autre ainsi que tous les locaux qui en dépendent, seront respectée. Il ne sera point permis d'y procéder à des visites domiciliaires ou perquisitions ou d'examiner ou d'inspecter les livres, papiers ou comptes, sauf dans les conditions et formes prescrites par les lois à l'égard des nationaux.

ARTICLE III

Il y aura entre les territoires des deux Hautes Parties Contractantes liberté réciproque de commerce et de navigation.

Les ressortissants de chacune des Hautes Parties Contractantes auront pleine liberté de se rendre avec leurs navires et leurs cargaisons dans les lieux, ports et rivières des territoires de l'autre qui sont ou pourront être ouverts au commerce extérieur; ils sont, toutefois, tenus de se conformer toujours aux lois du Pays où ils arrivent.

ARTICLE IV

Les droits de douane perçus sur les articles, produits naturels ou fabriqués des territoires de l'une des Hautes Parties Contractantes, à leur importation dans les territoires de l'autre, seront réglés, soit par des arrangements spéciaux entre les deux Pays, soit par la législation intérieure de chacun d'eux.

Aucune des Parties Contractantes n'imposera à l'exportation d'un article quelconque à destination des territoires de l'autre des droits ou charges quelconques autres ou plus élevés que ceux qui sont ou pourront être imposés à l'exportation des articles similaires à destination de tout autre pays étranger.

ARTICLE V

Les Hautes Parties Contractantes s'engagent à n'entraver leurs relations commerciales réciproques par aucune prohibition d'importation, d'exportation ni de transit.

Des exception pourront toutefois être faites dans les cas suivants, en tant qu'elles sont appliquées à tous les autres pays ou du moins à tous les pays qui se trouvent dans les mêmes conditions:

1. Relativement aux approvisionnements de guerre, dans des circonstances exceptionnelles;

2. Pour des considérations affectant la sécurité publique;

3. Pour cause de salubrité publique et en vne d'assurer la protection des animaux et des plantes utiles contre les maladies et les parasites;

Digitized by Google

4. Dans le but d'appliquer à des marchandises étrangères des interdictions ou des restrictions établies par la législation intérieure à l'égard de la production, du placement ou du trafic de marchandises indigènes de même nature.

ARTICLE VI

Les ressortissants de chacune des Hautes Parties Contractantes jouiront, dans les territoires de l'autre, d'une parfaite égalité de traitement avec les nationaux, quant à l'exemption de droits de transit et pour tout ce qui concerne le magasinage, les primes, les drawbacks ainsique les facilités touchant l'importation ou l'exportation des marchandises.

ARTICLE VII

Les négociants et les industriels que, par l'exhibition d'une carte de légitimation industrielle, délivrée par les autorités de l'une des Parties Contractantes, prouvent qu'ils sont autorisés à exercer leur commerce ou industrie dans les territoires de cette Partie, pourront, dans les territoires de l'autre, soit en personne, soit par des commis voyageurs, faire des achats ou recueillir des commandes, avec ou sans échantillons. Ces négociants, industriels et leurs commis voyageurs, en faisant ainsi des achats et en recueillant des commandes, jouiront, en matière d'impositions et de facilités du traitement de la nation la plus favorisée.

Les Parties Contractantes se donneront réciproquement connaissance des autorités chargées de délivrer les cartes de légitimation.

Les articles importés comme échantillons dans les buts mentionnés dans l'alinéa 1 seront, dans chacun des deux Pays, admis temporairement en franchise de droit, en conformité des règlements et formalités de douane, établis pour assurer leur réexportation ou le payement des droits de douane prescrits en cas de non-réexportation dans le délai prévu par la loi. Toutefois, ledit privilège ne s'étendra pas aux articles qui, à cause de leur quantité ou valeur, ne peuvent pas être considérés comme échantillons, ou qui, à cause de leur nature, ne sauraient être identifiés lors de leur réexportation. Le droit de décider si un échantillon est susceptible d'admission en franchise, appartient exclusivement dans tous les cas, aux autorités compétentes du lieu ou l'importation a été effectuée.

ARTICLE VIII

Les marques de reconnaissance, estampilles ou cachets apposés au moment de l'exportation par les autorités douanières de l'une des Parties Contractantes aux échantillons mentionnés dans l'article précédent ainsi que la liste de ces échantillons qui est officiellement attestée par elles et en contient la description détaillée, seront réciproquement acceptés par les autorités douanières de l'autre pour établir leur caractère d'échantillons et leur assurer l'exemption de toute inspection, sauf en tant que cette dernière est nécessaire pour constater que les échantillons présentés sont identiques avec ceux énumérés dans la liste. Les autorités douanières de chacune des Parties Contractantes pourront toutefois apposer une marque supplémentaire aux échantillons dans les cas spéciaux où elles jugent nécessaire de prendre cette précaution.

ARTICLE IX

Les sociétés par actions (anonymes) et autres sociétés et associations commerciales, industrielles ou financières, y compris les compagnies d'assurance, domiciliées dans les territoires de l'une des Parties Contractantes et ayant l'existence légale d'après les lois qui y sont en vigueur, seront reconnues comme ayant l'existence légale dans les territoires de l'autre et autorisées à y ester en justice devant les tribunaux, soit pour intenter une action, soit pour y défendre d'après les lois de cette autre Partie.

Leur admission à l'exercice de leur industrie ou de leur commerce ainsi qu'à l'acquisition de biens dans les territoires de l'autre Partie se règle d'après les prescriptions qui y sont en vigueur. En tout cas, lesdites sociétés, associations et compagnies jouiront, dans ces territoires, des mêmes droits que ceux qui sont ou pourront être accordés à des sociétés, associations et compagnies similaires de la nation la plus favorisée.

ARTICLE X

Tous les articles qui sont of pourront être légalement importés, dans les ports de l'une des Hautes Parties Contractantes, par des navires nationaux, pourront, de même, être importés dans ces ports par des navires de l'autre Partie Contractante, sans être soumis à aucuns droits ou charges, de quelque dénomination que ce soit,

ARTICLE III

Subject to the stipulations of the supplementary agreement to the present treaty, Japanese subjects shall be governed within the territories of Manchoukuo by the provision of the laws and ordinances of that country.

With regard to the application on the stipulations of the preceding paragraph, Japanese subjects shall not, under any circumstances, be accorded less favourable treatment than that which is or may be accorded to the nationals of Manchoukuo.

The stipulations of the preceding two paragraphs shall, in so far as they are applicable to juridical persons, apply to Japanese juridical persons.

ARTICLE IV

Companies and other juridical persons which have been established under the laws and ordinances of Japan and which have, at the time of the coming into force of the present treaty, head or principal offices within the territories of Manchoukuo shall, simultaneously with the coming into force of the present treaty, be recognized as companies or other juridical persons of a nature similar to or most closely analogous with those established under the laws and ordinances of Manchoukuo.

The Government of Manchoukuo shall recognize the establishment of companies and other juridical persons which have been established under the laws and ordinances of Japan and which have, at the time of the coming into force of the present treaty, branch or subordinate offices within the territories of Manchoukuo.

ARTICLE V

The stipulations of the present treaty shall not prejudice the rights, privileges, immunities and exemptions of particular Japanese subjects or juridical persons based on the special engagements entered into between Japan and Manchoukuo.

ARTICLE VI

The present treaty shall come into force on the first of December, the 12th Year of Showa, corresponding to the first of December, the Fourth Year of Kangte.

ARTICLE VII

The present treaty has been drawn up in Japanese and Chinese texts, and, should any difference in interpretation arise between the two texts, the Japanese text shall prevail.

SUPPLEMENTARY AGREEMENT (A)

In signing to-day the treaty between Japan and Manchoukuo concerning the abolition of extraterritoriality in Manchoukuo and the transfer of the administrative rights over the South Manchuria Railway Zone, the respective plenipotentiaries of the two countries have agreed as follows:

CHAPTER I

JURISDICTION

ARTICLE I

The system of consular courts existing for Japanese subjects in Manchoukuo shall, simultaneously with the coming into force of the treaty, cease to be in force, and thereafter Japanese subjects shall come within the jurisdiction of the law courts of Manchoukuo.

ARTICLE II

The Government of Manchoukuo engage to guarantee to the lives and property of Japanese such judicial protection as conforms to international law and the general principles of law.

ARTICLE III

Contentious cases, civil and penal, and non-contentious cases which remain pending at the consular courts of Japan at the time of the coming into force of the treaty, shall continue to be disposed of in pursuance of the procedure hitherto followed, and, for the purposes of that disposal, the jurisdiction of the consular courts of Japan shall continue to be in full force.

In all matters that relate to the cases to be disposed of under the preceding paragraph, the competent authorities of Manchoukuo shall afford aid on request by the competent authorities of Japan.

ARTICLE IV

With regard to criminal acts committed by Japanese subjects before the coming into force of the treaty, the law courts of Manchoukuo are competent to try and

Digitized by Google

decide concerning the said acts, only when such acts either contravene the penal laws and regulations of Japan in force at the time they were committed and also constitute punishable offences under the penal laws and regulations of Manchoukuo, or contravene those penal laws and regulations of Manchoukuo the application of which to Japanese subjects has been approved by Japan.

The Government of Manchoukuo engage not to punish more severely than under the laws and ordinances of Japan the criminal acts of Japanese subjects referred to in the preceding paragraph.

ARTICLE V

With regard to any of the offences under Articles LXXIII to LXXIX, LXXXI to LXXXIX and CXCVII of the Criminal Code of Japan, or under the Japanese Law for the Preservation of the Public Peace, which were committed by Japanese subjects within the territories of Manchoukuo before the coming into force of the treaty, the Government of Manchoukuo shall deliver the offenders, together with the relevant evidence, to the Government of Japan.

ARTICLE VI

Those criminal cases in which searches are being made by Japanese consular officers at the time of the coming into force of the treaty and which can be punished under the laws and ordinances of Manchoukuo shall, together with the relevant documents and evidence, be taken over by the competent authorities of Manchoukuo.

With regard to the cases taken over under the preceding paragraph ,the Government of Manchoukuo shall recognize the procedure which was, before they were so taken over, fulfilled under the laws and ordinances of Japan in respect of accusation, prosecution, self-surrender and search, as having the same validity as if it were fulfilled under the laws and ordinances of Manchoukuo.

ARTICLE VII

The Government of Manchoukuo shall recognize the validity of the titles of debt drawn up under the laws and ordinances of Japan before the coming into force of the treaty. The same shall apply to the titles of debt drawn up in respect of cases to be disposed of under the first paragraph of Article III of the present agreement.

ARTICLE VIII

The Government of Manchoukuo shall recognize the registrations effected before the coming into force of the treaty by Japanese consular officers under the laws and ordinances of Japan as having the same validity as if they were effected by the competent authorities of Manchoukuo under the laws and ordinances of that country.

CHAPTER II

Administration over the South Manchuria Railway Zone

ARTICLE IX

The Government of Japan shall, simultaneously with the coming into force of the treaty, transfer to the Government of Manchoukuo administration relating to taxation, police, communications, et cetera, over the South Manchuria Railway Zone.

ARTICLE X

The Government of Manchoukuo engage, after the transfer of administration under the preceding article, to take appropriate steps, in administering the South Manchuria Railway Zone, to prevent interference with the advancement of general culture, the development of industries, et cetera.

ARTICLE XI

The taxes, the imposition of which is within the rights of the Government of Japan at the time of the transfer of the administration over the South Manchuria Railway Zone, shall be levied and collected by the Government of Manchoukuo in accordance with a decision to be made by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Prime Minister of that country.

In connection with the stipulations of the preceding paragraph, the Government of Manchoukuo shall deliver to the Government of Japan funds of an amount to be decided upon by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Prime Minister of that country.

Digitized by Google

CHAPTER III

POLICE AND OTHER ADMINISTRATION

ARTICLE XII

Within the territories of Manchoukuo, the Government of Japan shall, simultaneously with the coming into force of the treaty, cease to exercise police and other administration in respect of Japanese subjects, and thereafter they shall come within the jurisdiction of Manchoukuo in regard to such administration.

The Government of Manchoukuo engage, in exercising police and other administration in respect of Japanese subjects, to afford all possible guarantees for the protection of their lives and property.

ARTICLE XIII

Cases concerning police and other matters, which are being dealt with at the time of the coming into force of the treaty by the competent authorities of Japan, shall, as a general principle, be taken over, together with the relevant documents, by the competent authorities of Manchoukuo.

CHAPTER IV

ADMINISTRATION CONCERNING SHRINES, EDUCATION AND MILITARY MATTERS

ARTICLE XIV

The Government of Manchoukuo agree that, within their territories after the coming into force of the treaty, Japan or her subjects shall establish shrines under her own laws and ordinances and her Government shall administer matters relating to such shrines.

ARTICLE XV

The Government of Manchoukuo, with regard to important matters connected with the educational administration to be exercised by them in respect of Japanese subjects, engage, for the time being, to act in accordance with a decision to be previously made by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Prime Minister of that country.

The Government of Manchoukuo agree that, within their territories for the time being after the coming into force of the treaty, Japan or her subjects shall, under her own laws and ordinances, open, conduct or control schools and other educational matters concerning her subjects, in accordance with a decision to be made by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Prime Minister of that country.

Within the territories of Manchoukuo, the Government of Japan may, under her own laws and ordinances, establish school associations, and the federations of such associations, with the status of public juridical persons, in order to cause them to open, conduct or control the schools and other educational institutions referred to in the preceding paragraph. The Government of Manchoukuo shall recognize the establishment of such associations and federations.

ARTICLE XVI

The Government of Manchoukuo agree that, within the territories of Manchoukuo after the coming into force of the treaty, administration concerning military enlistment, service, muster, and other military matters in respect of Japanese subjects shall be exercised by the Government of Japan.

ARTICLE XVII

Of the laws and ordinance of Japan to be applied under the present chapter, those which are applicable through judicial procedure shall be applied by the judicial authorities of Japan.

ARTICLE XVIII

The Government of Manchoukuo engage to afford aid in the application, under the present chapter, of the laws and ordinances of Japan, and, for the purposes of affording that aid, to take the necessary steps in accordance with a decision to be made by consultation between the competent authorities of Japan and of Manchoukuo.

Digitized by Google

The percentage allotted to each of the above categories may be modified subject to the following conditions:

Increase in category either of bordered greys or bleached shall not exceed 20 per cent, of quantity allotted to that category, and an increase in any other category shall not exceed 10 per cent of quantity allotted to that category.

9. Transfer: The quantity transferable from category either of bordered greys or bleached shall not exceed 20 per cent of quantity allotted to that category and the quantity transferable from any other category shall not exceed 10 per cent of quantity allotted to that category: and

The total quota of cotton piece-goods for any piece-goods year shall not be increased by the above modification of quantity allotted to each category.

10. The quota for the period intervening the enforcement of the arrangement and the commencement of the first piece-goods year:

(a) The quota of cotton piece-goods for the period between the date on which the present Indian customs on cotton piecegoods year begins shall be the proportionate fraction of the quantity that would have been allotted to the whole piecegoods year from April 11, 1933 to March 31, 1934, on the basis of the quantity of Indian raw cotton imported into Japan in the cotton year of 1933 (From January 1 to December 31).

(b) The quota for his period and the first half-yearly instalment of the first piece-goods year quota should be consolidated into one for the period of approximately nine months, ending at the end of September, 1934.

The treaty shall come into force immediately after an exchange of ratifications, and shall remain in force until March 31, 1937.

TREATY BETWEEN JAPAN AND MANCHOUKUO CONCERNING THE ABOLITION OF EXTRATERRITORIALITY IN MANCHOUKUO

Signed at Hsinking on November 5, 1937

1. Treaty between Japan and Manchoukuo concerning the Abolition of Extraterritoriality in Manchoukuo and the Transfer of the Administrative Rights over the South Manchuria Railway Zone.

Whereas the Government of Japan, in accordance with the principle of the preamble to the treaty between Japan and Manchoukuo concerning the residence of Japanese subjects, taxation, et cetera, in Manchoukuo signed on the 10th day of the sixth month of the 11th Year of Showa, corresponding to the 10th day of the sixth month of the Third Year of Kangte, and having regard to the results of the operation of the said treaty and also to the improvements introduced into the laws and ordinances and the various systems of Manchoukuo, have decided to abolish completely the right of extraterritoriality at present enjoyed in Manchoukuo by Japan and to transfer entirely the administrative right over the South Manchuria Railway Zone; and

Whereas the Government of Manchoukuo, in response to this decision by the Government of Japan, are now in a position to afford, in the spirit in which their Empire was founded, all the necessary guarantees for further ensuring and enhancing the well-being and prosperity of Japanese subjects in Manchoukuo;

Now, therefore, with reference to abolition of the right of extraterritoriality at present enjoyed in Manchoukuo by Japan and to the transfer of the administrative rights over the South Manchuria Railway Zone, the Governments of Japan and of Manchoukuo have agreed as follows to regulate the relations between the two countries:

ARTICLE I

The Government of Japan shall, in accordance with the stipulations of the supplementary agreements to the present treaty, abolish the right of extraterritoriality at present enjoyed in Manchoukuo by Japan.

ARTICLE II

The Government of Japan shall, in accordance with the stipulations of the supplementary agreement to the present transfer to the Government of Manchoukuo the administrative rights over the South Manchuria Railway Zone.

Digitized by Google

ARTICLE III

Subject to the stipulations of the supplementary agreement to the present treaty, Japanese subjects shall be governed within the territories of Manchoukuo by the provision of the laws and ordinances of that country.

With regard to the application on the stipulations of the preceding paragraph, Japanese subjects shall not, under any circumstances, be accorded less favourable treatment than that which is or may be accorded to the nationals of Manchoukuo.

The stipulations of the preceding two paragraphs shall, in so far as they are applicable to juridical persons, apply to Japanese juridical persons.

ARTICLE IV

Companies and other juridical persons which have been established under the laws and ordinances of Japan and which have, at the time of the coming into force of the present treaty, head or principal offices within the territories of Manchoukuo shall, simultaneously with the coming into force of the present treaty, be recognized as companies or other juridical persons of a nature similar to or most closely analogous with those established under the laws and ordinances of Manchoukuo.

The Government of Manchoukuo shall recognize the establishment of companies and other juridical persons which have been established under the laws and ordinances of Japan and which have, at the time of the coming into force of the present treaty, branch or subordinate offices within the territories of Manchoukuo.

ARTICLE V

The stipulations of the present treaty shall not prejudice the rights, privileges, immunities and exemptions of particular Japanese subjects or juridical persons based on the special engagements entered into between Japan and Manchoukuo.

ARTICLE VI

The present treaty shall come into force on the first of December, the 12th Year of Showa, corresponding to the first of December, the Fourth Year of Kangte.

ARTICLE VII

The present treaty has been drawn up in Japanese and Chinese texts, and, should any difference in interpretation arise between the two texts, the Japanese text shall prevail.

SUPPLEMENTARY AGREEMENT (A)

In signing to-day the treaty between Japan and Manchoukuo concerning the abolition of extraterritoriality in Manchoukuo and the transfer of the administrative rights over the South Manchuria Railway Zone, the respective plenipotentiaries of the two countries have agreed as follows:

CHAPTER I

JURISDICTION

ARTICLE I

The system of consular courts existing for Japanese subjects in Manchoukuo shall, simultaneously with the coming into force of the treaty, cease to be in force, and thereafter Japanese subjects shall come within the jurisdiction of the law courts of Manchoukuo.

ARTICLE II

The Government of Manchoukuo engage to guarantee to the lives and property of Japanese such judicial protection as conforms to international law and the general principles of law.

ARTICLE III

Contentious cases, civil and penal, and non-contentious cases which remain pending at the consular courts of Japan at the time of the coming into force of the treaty, shall continue to be disposed of in pursuance of the procedure hitherto followed, and, for the purposes of that disposal, the jurisdiction of the consular courts of Japan shall continue to be in full force.

In all matters that relate to the cases to be disposed of under the preceding paragraph, the competent authorities of Manchoukuo shall afford aid on request by the competent authorities of Japan.

ARTICLE IV

With regard to criminal acts committed by Japanese subjects before the coming into force of the treaty, the law courts of Manchoukuo are competent to try and

Digitized by Google

decide concerning the said acts, only when such acts either contravene the penal laws and regulations of Japan in force at the time they were committed and also constitute punishable offences under the penal laws and regulations of Manchoukuo, or contravene those penal laws and regulations of Manchoukuo the application of which to Japanese subjects has been approved by Japan.

The Government of Manchoukuo engage not to punish more severely than under the laws and ordinances of Japan the criminal acts of Japanese subjects referred to in the preceding paragraph.

ARTICLE V

With regard to any of the offences under Articles LXXIII to LXXIX, LXXXI to LXXXIX and CXCVII of the Criminal Code of Japan, or under the Japanese Law for the Preservation of the Public Peace, which were committed by Japanese subjects within the territories of Manchoukuo before the coming into force of the treaty, the Government of Manchoukuo shall deliver the offenders, together with the relevant evidence, to the Government of Japan.

ARTICLE VI

Those criminal cases in which searches are being made by Japanese consular officers at the time of the coming into force of the treaty and which can be punished under the laws and ordinances of Manchoukuo shall, together with the relevant documents and evidence, be taken over by the competent authorities of Manchoukuo.

With regard to the cases taken over under the preceding paragraph ,the Government of Manchoukuo shall recognize the procedure which was, before they were so taken over, fulfilled under the laws and ordinances of Japan in respect of accusation, prosecution, self-surrender and search, as having the same validity as if it were fulfilled under the laws and ordinances of Manchoukuo.

ARTICLE VII

The Government of Manchoukuo shall recognize the validity of the titles of debt drawn up under the laws and ordinances of Japan before the coming into force of the treaty. The same shall apply to the titles of debt drawn up in respect of cases to be disposed of under the first paragraph of Article III of the present agreement.

ARTICLE VIII

The Government of Manchoukuo shall recognize the registrations effected before the coming into force of the treaty by Japanese consular officers under the laws and ordinances of Japan as having the same validity as if they were effected by the competent authorities of Manchoukuo under the laws and ordinances of that country.

CHAPTER II

Administration over the South Manchuria Railway Zone

ARTICLE IX

The Government of Japan shall, simultaneously with the coming into force of the treaty, transfer to the Government of Manchoukuo administration relating to taxation, police, communications, et cetera, over the South Manchuria Railway Zone.

ARTICLE X

The Government of Manchoukuo engage, after the transfer of administration under the preceding article, to take appropriate steps, in administering the South Manchuria Railway Zone, to prevent interference with the advancement of general culture, the development of industries, et cetera.

ARTICLE XI

The taxes, the imposition of which is within the rights of the Government of Japan at the time of the transfer of the administration over the South Manchuria Railway Zone, shall be levied and collected by the Government of Manchoukuo in accordance with a decision to be made by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Prime Minister of that country.

In connection with the stipulations of the preceding paragraph, the Government of Manchoukuo shall deliver to the Government of Japan funds of an amount to be decided upon by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Prime Minister of that country.

Digitized by Google

CHAPTER III

POLICE AND OTHER ADMINISTRATION

ARTICLE XII

Within the territories of Manchoukuo, the Government of Japan shall, simultaneously with the coming into force of the treaty, cease to exercise police and other administration in respect of Japanese subjects, and thereafter they shall come within the jurisdiction of Manchoukuo in regard to such administration.

The Government of Manchoukuo engage, in exercising police and other administration in respect of Japanese subjects, to afford all possible guarantees for the protection of their lives and property.

ARTICLE XIII

Cases concerning police and other matters, which are being dealt with at the time of the coming into force of the treaty by the competent authorities of Japan, shall, as a general principle, be taken over, together with the relevant documents, by the competent authorities of Manchoukuo.

CHAPTER IV

ADMINISTRATION CONCERNING SHRINES, EDUCATION AND MILITARY MATTERS

ARTICLE XIV

The Government of Manchoukuo agree that, within their territories after the coming into force of the treaty, Japan or her subjects shall establish shrines under her own laws and ordinances and her Government shall administer matters relating to such shrines.

ARTICLE XV

The Government of Manchoukuo, with regard to important matters connected with the educational administration to be exercised by them in respect of Japanese subjects, engage, for the time being, to act in accordance with a decision to be previously made by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Prime Minister of that country.

The Government of Manchoukuo agree that, within their territories for the time being after the coming into force of the treaty, Japan or her subjects shall, under her own laws and ordinances, open, conduct or control schools and other educational matters concerning her subjects, in accordance with a decision to be made by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Prime Minister of that country.

Within the territories of Manchoukuo, the Government of Japan may, under her own laws and ordinances, establish school associations, and the federations of such associations, with the status of public juridical persons, in order to cause them to open, conduct or control the schools and other educational institutions referred to in the preceding paragraph. The Government of Manchoukuo shall recognize the establishment of such associations and federations.

ARTICLE XVI

The Government of Manchoukuo agree that, within the territories of Manchoukuo after the coming into force of the treaty, administration concerning military enlistment, service, muster, and other military matters in respect of Japanese subjects shall be exercised by the Government of Japan.

ARTICLE XVII

Of the laws and ordinance of Japan to be applied under the present chapter, those which are applicable through judicial procedure shall be applied by the judicial authorities of Japan.

ARTICLE XVIII

The Government of Manchoukuo engage to afford aid in the application, under the present chapter, of the laws and ordinances of Japan, and, for the purposes of affording that aid, to take the necessary steps in accordance with a decision to be made by consultation between the competent authorities of Japan and of Manchoukuo.

TREATY OF FRIENDSHIP, COMMERCE AND NAVIGATION BETWEEN JAPAN AND SIAM

Signed at Bangkok, December 8, 1937

His Majesty the Emperor of Japan and His Majesty the King of Siam, being desirous of strengthening the relations of amity and good understanding which happily exist between the two States, and being convinced that this can best be accomplished by revising the treaties hitherto existing between the two countries, have resolved to complete such revision, based upon the principles of reciprocity, equity and mutual benefit, and for that purpose have named as their Plenipotentiaries, that is to say:

His Majesty the Emperor of Japan: Kuramatsu Murai, Jusii, Third Class of the Imperial Order of the Sacred Treasure, His Envoy Extraordinary and Minister Plenipotentiary at the Court of His Majesty the King of Siam;

His Majesty the King of Siam: Luang Pradist Manudharm (Pridi Banomyong), Minister of Foreign Affairs;

Who, after having communicated to each other their respective full powers, found to be in good and due form, have agreed upon the following articles:

ARTICLE I

There shall be constant peace and perpetual friendship between Japan and Siam.

ARTICLE II

The subjects of each of the High Contracting Parties shall have full liberty to enter, travel, and reside in the territories of the other, and conforming themselves to the laws and regulations of the country—

1. Shall in all that relate to travel and residence, be placed in all respects on the same footing as native subjects.

2. They shall have the right, equally with native subjects, to carry on their commerce and manufacture, and to trade in all kinds of merchandise of lawful commerce, either in person or by agents, singly or in partnership with foreigners or native subjects.

3. They shall be permitted, on the same footing as native subjects, to engage in religious, educational and charitable work.

4. They shall be permitted to own or lease and occupy houses, manufactories, warehouses and shops which may be necessary for them, and to lease land for residential, commercial, industrial, religious, charitable and other lawful purposes and for use as cemeteries in the same manner as native subjects.

5. They shall not be compelled, under any pretext whatsoever, to pay any internal charges or taxes other or higher than those that are or may be paid by native subjects.

6. They shall receive, in the territories of the other, the most constant protection and security for their persons and property and shall enjoy in this respect the same rights and privileges as are or may be granted to native subjects.

7. In all that relates to industrial pursuits, and to callings and professions as well as to educational studies, they shall, throughout the whole extent of the territories of the other, be placed in all respects on the same footing as the subjects or citizens of the most favoured nation.

8. As regards the acquisition and possession of movable property, as well as the disposition of property rights of every description, they shall, in conformity with the laws and regulations in force in the country, enjoy the same treatment as accorded to native subjects.

9. And as regards the acquisition and possession of immovable property, they shall, in the whole extent of the territories of the other, enjoy, on condition of reciprocity, the most-favoured-nation treatment.

ARTICLE III

The subjects of each of the High Contracting Parties shall be exempt in the territories of the other from compulsory military service on land, on sea, or in the air, in the regular forces, or in the national guard, or in the militia; from all contributions in money or in kind, imposed in lieu of personal military service, and from all forced loans or military contributions. They shall not be subjected, in time of peace or in time of war, to military requsi-

Digitized by Google

way as the cases under the said paragraph.
IV. Ad Article VIII of the supplementary agreement:

With regard to registrations made under the laws and ordinances of Japan, the Government of Manchoukuo shall regard rights pertaining to immovable property as the similar or analogous rights, and trade marks and managers as such respectively, under the laws and ordinances of Manchoukuo.
V. Ad Article IX of the supplementary agreement:

1. The Government of Manchoukuo shall, as a general principle, establish advisory bodies in places where local committees have hitherto existed, in order that the local authorities of that country can ascertain the opinions of residents within the South Manchuria Railway Zone in respect of such local administration as directly affects the welfare and interests of such residents.

2. The public imposts at present collected by the South Manchuria Railway Company within the Railway Zone shall be abolished simultaneously with the transfer of the administration over the said zone.
VI. Ad Article XV of the supplementary agreement:

1. The education mentioned in the first paragraph of the present article refers, as a general principle, to that concerning primary education.

2. The Government of Manchoukuo shall as far as possible improve and replenish the system of primary education for Japanese subjects: as occasion arises, the Government of Manchoukuo shall grant a reasonable amount of subsidy to bodies conducting such educational work, and the Government of Japan shall also afford them finanical assistance.

3. The Government of Manchoukuo shall, in accordance with a decision to be made by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Prime Minister of that country, pay each year a share of the expenses of the educational work for Japanese subjects conducted by Japanese within the territories of Manchoukuo.
VII. Ad Article XVII of the supplementary agreement:

The judicial authorities of Japan referred to in the present article are, for the time being, her consular officers.
VIII. Ad Article XIX of the supplementary agreement:

The Government of Manchoukuo shall, with regard to the institutions and staffs concerned, taken over by them under the present treaty, take appropriate steps with a view to facilitating the disposal of business relating to the organization of the said institutions, the assignment of the said staffs, et cetera.
IX. Ad Article XX of the supplementary agreement:

The Government of Manchoukuo may cause Japanese subjects to have renewed by that Government the certificates of approval, of permission, of licence, et cetera, issued by the competent authorities of Japan before the coming into force of the treaty, provided that the said Government shall levy no charge in connection therewith.

SUPPLEMENTARY AGREEMENT (B)

In signing to-day the Treaty between Japan and Manchoukuo concerning the abolition of extraterritoriality in Manchoukuo and the transfer of the administrative rights over the South Manchuria Railway Zone, the respective plenipotentiaries of the two countries have agreed as follows with reference to communication and related business in Manchoukuo:

ARTICLE I

Of the communication business within the South Manchuria Railway Zone, that which relates to third countries shall be conducted and controlled by the Japanese administrations until the time to be decided upon by consultation between the Japanese Ambassador Extraordinary and Plenipotentiary to Manchoukuo and the Prime Minister of that country.

ARTICLE II

The Government of Japan may entrust to the Government of Manchoukuo the conduct of business of a kind which exists under the internal system of Japan but which does not exist under the internal system of Manchoukuo, and of other kind of business which is cosidered to be of special necessity. The kind and the scope of the business to be so entrusted shall be provided for in a business agreement to be concluded between the competent authorities of Japan and of Manchoukuo.

The Government of Manchoukuo shall with all the attention required of a bona fide trustee, dispose of the business entrusted to them under the preceding paragraph, on behalf of the Government of Japan, in accordance with the provisions

Digitized by Google

of its laws and ordinances.

The Government of Japan shall pay to the Government of Manchoukuo fees for the disposal of the business entrusted to the latter.

ARTICLE III

The currency to be used in connection with the business entrusted under the preceding article shall be Manchoukuo currency.

The rate of exchange between Japanese and Manchoukuo currencies shall be decided upon by consultation between the competent authorities of Japan and of Manchoukuo.

ARTICLE IV

Matters relating to the operation of the present agreement shall be provided for in a business agreement to be concluded between the competent authorities of Japan and of Manchoukuo.

ARTICLE V

The protocol of signature attached to the treaty between Japan and Manchoukuo concerning postal business signed at Hsinking on the 26th of December, the 10th Year of Showa, corresponding to the 26th of December, the Second Year of Kangte, shall cease to be in force.

ARTICLE VI

The present agreement shall come into force simultaneously with the treaty.

In witness whereof, the plenipotentiaries of Japan and of Manchoukuo have signed this agreement and affixed their seals thereto.

Agreed Terms of Understanding between the Plenipotentiaries of Japan and of Manchoukuo concerning Communication and Allied Business in Manchoukuo.

I. The Government of Manchoukuo shall recognize the use of Japanese currency until the time to be decidedupon by consultation between the competent authorities of Japan and of Manchoukuo.

II. The competent authorities of Manchoukuo shall keep in close contact with the competent authorities of Japan with reference to the improvement and operation of the system and equipment concerning the business entrusted.

III. With regard to the business entrusted, the Government of Manchoukuo shall levy no public imposts or fees which are not at present imposed in Japan.

ABKOMMEN GEGEN DIE KOMMUNISTISCHE INTERNATIONALE ZUWISCHEN JAPAN UND DEUTSCHLAND

(November 25, 1936)

Die regierung des Deutschen Reiches und die Kaiserlich-Japanese Regierung.

In der Erkenntnis, dass das Ziel der Kommunistischen Internationale, Komintern genannt, die Zersetzung und Vergewaltigung der bestehenden Staaten mit allen zu Gebote stehenden Mitteln ist,

In der Überzeugung, dass die Duldung einer Einmischung der Kommunistischen Internationale in die inneren Verhältnisse der Nationen nicht nur deren inneren Frieden und soziales Wohlleben gefährdet, sondern auch den Weltfrieden uberhaupt bedroht,

Sind in dem Wunsche, gemeinsam zur Abwehr gegen die kommunistische Zersetzung zusammenzuarbeiten, in folgendem übereingekommen:

ARTIKEL I Die Hohen Vertragschliessenden Staaten kommen überein, sich gegenseitig über die Tätigkeit der Kommunistischen Internationale zu unterrichten, über die notwendigen Abwehrmassnahmen zu beraten und diese in enger Zusammenarbeit durchzuführen.

ARTIKEL II Die Hohen Vertragschliessenden Staaten werden dritte Staaten, deren innerer Friede durch die Zersetzungsarbeit der Kommunistischen Internationale bedroht wird, gemeinsam einladen, Abwehrmassnahmen im Geiste dieses Abkommens zu ergreifen oder an diesem Abkommen teilzunehmen.

ARTIKEL III Für dieses Abkommen gelten sowohl der deutsche wie auch der japanische Text als Urschrift. Es tritt am Tage der Unterzeichnung in Kraft und gilt für die Dauer von fünf Jahren. Die Hohen Vertragschliessenden Staaten werden sich rechtzeitig vor Ablauf dieser Frist über die

Digitized by Google

weitere Gestaltung ihrer Zusammenarbeit verständigen.

ZUSATZPROTOKOLL ZUM ABKOMMEN GEGEN DIE KOMMUNISTISCHE INTERNATIONALE.

Anlässlich der heutigen Unterzeichnung des Abkommens gegen die Kommunistische Internationale sind die Bevollmächtigten in folgendem übereingekommen:

(a) Die zuständigen Behörden der beiden Hohen Vertragschliessenden Staaten werden in bezug auf den Nachrichtenaustausch über die Tätigkeit der Kommunistischen Internationale sowie auf die Aufklärungs-und Abwehrmassnahmen gegen die Kommunistische Internationale in enger Weise zusammenarbeiten.

(b) Die zuständigen Behörden der beiden Hohen Vertragschliessenden Staaten werden im Rahmen der bestehenden Gesetze strenge Massnahmen gegen diejenigen ergreifen, die sich im Inland order Ausland direkt oder indirekt im Dienste der Kommunistischen Internationale betätigen oder deren Zersetzungsarbeit Vorschub leisten.

(c) Um die in (a) festgelegte Zusammenarbeit der zuständigen Behörden der beiden Hohen Vertragschliessenden Staaten zu erleichtern, wird eine ständige Kommission errichtet werden. In dieser Kommission werden die weiteren zur Bekämpfung der Zersetzungsarbeit der Kommunistischen Internationale notwendigen Abwehrmassnahmen erwogen und beraten.

THE ITALIAN TEXT OF THE TRIPARTITE PROTOCOL AGAINST THE COMMUNIST INTERNATIONAL

(Signed at Rome on November 6, 1937)

Protocollo

IL GOVERNO ITALIANO,

IL GOVERNO DEL REICH GERMANICO e

IL GOVERNO IMPERIALE DEL GIAPPONE,

Considerando che l'Internazionale Comunista continua a mettere costantemente in pericolo il mondo civile in Occidente e in Oriente turbandovi e distruggendovi la pace e l'ordine,

Convinti che soltanto una stretta collaborazione fra tutti gli Stati interessati al mantenimento della pace e dell'ordine può limitare e rimuovere tale pericolo,

Considerando cho l'Italia—che coll'avvento del Regime Fascista ha combattuto con inflessibile determinazione tale pericolo ed ha eliminato l'Internazionale Comunista dal suo territorio—ha deciso di schierarsi contro il nemico comune insieme con la Germania e col Giappone, che da parte loro sono animati dalla stessa volontà di difendersi contro l'Internazionale Comunista,

Hanno, in conformità dell'Articolo 2 dell'Accordo contro l'Internazionale Comunista concluso a Berlino il 25 Novembre 1936 fra la Germania ed il Giappone, convenuto quanto segue:

ARTICOLO I

L'Italia entra a far parte dell'Accordo contro l'Internazionale Comunista e del Protocollo supplementare conclusi il 25 Novembre 1936 fra la Germania ed il Giappone, il cui testo è allegato nell'annesso al presente Protocollo.

ARTICOLO II

Le tre Potenze firmatarie del presente Protocollo convengono che l'Italia sarà considerata come firmataria originaria dell'Accordo e del Protocollo supplementare menzionati all'Articolo precedente, la firma del presente Protocollo essendo equivalente alla firma del testo originale dell'Accordo e del Protocollo supplementare predetti.

ARTICOLO III

Il presente Protocollo costituirà parte integrante dell'Accordo e del Protocollo supplementare sopramenzionati.

ARTICOLO IV

Il presente Protocollo è redatto in italiano, giapponese e tedesco, ciascun testo essendo considerato come autentico. Esso entrerà in vigore il giorno della firma.

IN FEDE DI CHE, i sottoscritti, debitamente autorizzati dai loro rispettivi Governi, hanno firmato il presente Protocollo e vi hanno apposto i loro sigilli.

TREATY OF FRIENDSHIP, COMMERCE AND NAVIGATION BETWEEN JAPAN AND SIAM

Signed at Bangkok, December 8, 1937

His Majesty the Emperor of Japan and His Majesty the King of Siam, being desirous of strengthening the relations of amity and good understanding which happily exist between the two States, and being convinced that this can best be accomplished by revising the treaties hitherto existing between the two countries, have resolved to complete such revision, based upon the principles of reciprocity, equity and mutual benefit, and for that purpose have named as their Plenipotentiaries, that is to say:

His Majesty the Emperor of Japan: Kuramatsu Murai, Jusii, Third Class of the Imperial Order of the Sacred Treasure, His Envoy Extraordinary and Minister Plenipotentiary at the Court of His Majesty the King of Siam;

His Majesty the King of Siam: Luang Pradist Manudharm (Pridi Banomyong), Minister of Foreign Affairs;

Who, after having communicated to each other their respective full powers, found to be in good and due form, have agreed upon the following articles:

ARTICLE I

There shall be constant peace and perpetual friendship between Japan and Siam.

ARTICLE II

The subjects of each of the High Contracting Parties shall have full liberty to enter, travel, and reside in the territories of the other, and conforming themselves to the laws and regulations of the country—

1. Shall in all that relate to travel and residence, be placed in all respects on the same footing as native subjects.

2. They shall have the right, equally with native subjects, to carry on their commerce and manufacture, and to trade in all kinds of merchandise of lawful commerce, either in person or by agents, singly or in partnership with foreigners or native subjects.

3. They shall be permitted, on the same footing as native subjects, to engage in religious, educational and charitable work.

4. They shall be permitted to own or lease and occupy houses, manufactories, warehouses and shops which may be necessary for them, and to lease land for residential, commercial, industrial, religious, charitable and other lawful purposes and for use as cemeteries in the same manner as native subjects.

5. They shall not be compelled, under any pretext whatsoever, to pay any internal charges or taxes other or higher than those that are or may be paid by native subjects.

6. They shall receive, in the territories of the other, the most constant protection and security for their persons and property and shall enjoy in this respect the same rights and privileges as are or may be granted to native subjects.

7. In all that relates to industrial pursuits, and to callings and professions as well as to educational studies, they shall, throughout the whole extent of the territories of the other, be placed in all respects on the same footing as the subjects or citizens of the most favoured nation.

8. As regards the acquisition and possession of movable property, as well as the disposition of property rights of every description, they shall, in conformity with the laws and regulations in force in the country, enjoy the same treatment as accorded to native subjects.

9. And as regards the acquisition and possession of immovable property, they shall, in the whole extent of the territories of the other, enjoy, on condition of reciprocity, the most-favoured-nation treatment.

ARTICLE III

The subjects of each of the High Contracting Parties shall be exempt in the territories of the other from compulsory military service on land, on sea, or in the air, in the regular forces, or in the national guard, or in the militia; from all contributions in money or in kind, imposed in lieu of personal military service, and from all forced loans or military contributions. They shall not be subjected, in time of peace or in time of war, to military requisi-

Digitized by Google

tions except as imposed upon native subjects, and they shall reciprocally be entitled to compensation payable to native subjects by the laws and regulations in force in the respective countries. With regard to the foregoing provisions, the subjects of each of the High Contracting Parties shall not be treated in the territories of the other less favourably than the subjects or citizens of the most favoured nation.

ARTICLE IV

The subjects of each of the High Contracting Parties shall enjoy in the territories of the other entire liberty of conscience, and, subject to the laws and regulations in force in the country, shall enjoy the right of private or public exercise of their worship.

ARTICLE V

The subjects of each of the High Contracting Parties shall have free access to the Courts of Justice of the other in pursuit and defence of their rights; they shall be at liberty, equally with native subjects, and with the subjects or citizens of the most favoured nation, to choose and employ lawyers, advocates and representatives to pursue and defend their rights before such Courts.

There shall be no conditions or requirements imposed upon the subjects of either of the High Contracting Parties in connection with such access to the Courts of Justice of the other, which do not apply to native subjects or to the subjects or citizens of the most favoured nation.

ARTICLE VI

The dwellings, warehouses, manufactories and shops and all other property of the subjects of each of the High Contracting Parties in the territories of the other, and all premises appertaining thereto used for lawful purposes, shall be respected. It shall not be allowable to proceed to make a domiciliary visit to, or a search of, any such buildings and premises, or to examine or inspect books, papers, or accounts, except under the conditions and with the forms prescribed by the laws and regulations for native subjects.

ARTICLE VII

There shall be reciprocally full and entire freedom of commerce and navigation between the territories of the two High Contracting Parties.

The subjects of each of the High Contracting Parties shall have liberty freely to come with their ships and cargoes to all places, ports and rivers in the territories of the other which are or may be opened to foreign commerce and navigation, and, conforming themselves to the laws and regulations of the country to which they thus come, shall enjoy the same rights, privileges, liberties, favours, immunities and exemptions in matters of commerce and navigation as are or may be enjoyed by the subjects or citizens of the most favoured nation.

ARTICLE VIII

Neither High Contracting Party shall establish or maintain prohibitions or restrictions on imports from or exports to the territories of the other Party which are not applied to the import and export of any like article originating in or destined for any other country.

The preceding provisions are not, however, applicable to such prohibitions or restrictions as follows, provided that they are applicable to all countries where similar conditions prevail:

(1) Prohibitions, restrictions or regulations for the enforcement of laws and regulations for the protection of public security or public health, including laws and regulations prohibiting or restricting the importation, exportation, or sale of alcohol or alcoholic beverages or of opium, the coca leaf, their derivatives, and other narcotic drugs;

(2) Prohibitions or restrictions on the trade or traffic in arms and munitions of war, and in exceptional circumstances other materials needed in war, it being agreed in this regard that either High Contracting Party may, in the event of its being engaged in war, enforce such import or export restrictions as may be required by the national interest;

(3) Prohibitions or restrictions necessary for the protection of animal or plant life against disease, harmful pests or extinction;

(4) Prohibitions or restrictions upon articles which, as regards production or trade, are or may hereafter be subject within the country to a monopoly exercised by or under the control of the State;

(5) Prohibitions or restrictions with regard to articles similr to those domes-

Digitized by Google

tic articles whose internal production, sale, or transport is forbidden or similarly restricted by the national law.

ARTICLE IX

The High Contracting Parties agree not to obstruct mutual commerce between the two countries by any prohibition or restriction placed upon the transit of article, subject to the following exceptions which, however, shall be applicable to all countries alike or to those countries where similar conditions prevail:

(1) Prohibitions or restrictions for reasons of public security or public health;

(2) Prohibitions or restrictions on the trade or traffic in arms and munitions of war under extraordinary circumstances;

(3) Prohibitions or restrictions necessary for the protection of animal or plant life against disease, harmful pests or extinction.

ARTICLE X

It is agreed that the Customs tariffs applicable to articles, the produce or manufacture of either of the High Contracting Parties imported into the territories of the other shall be regulated by the laws and regulations of the country of importation.

No other or higher duties shall be imposed on the importation into the territories of either of the High Contracting Parties of any article, the produce or manufacture of the territories of the other, from whatever place arriving, than on the like article produced or manufactured in any other foreign country, from whatever place arriving.

No other or higher duties, taxes or charges of any kind shall be imposed in the territories of either of the High Contracting Parties in respect of any article exported to the territories of the other, than such as are or may be payable in respect of the like article exported to any other foreign country.

ARTICLE XI

No internal duties levied for the benefit of the State, local authorities, or corporations which affect, or may affect, the production, manufacture, or consumption of any article in the territories of either of the High Contracting Parties shall for any reason be a higher or more burdensome charge on articles, the produce or manufacture of the territories of the other, than on similar articles of native origin.

ARTICLE XII

The subjects of each of the High Contracting Parties shall enjoy in the territories of the other a perfect equality of treatment with native subjects in all that relates to transit duties, warehousing, facilities, the examination and appraisement of merchandise and drawbacks.

ARTICLE XIII

Merchants and manufacturers, subjects of one of the High Contracting Parties, may, in the territories of the other, either personally or by means of commercial travellers, make purchases or collect orders, with or without samples, and such merchants, manufacturers, and their commercial travellers, while so making purchases and collecting orders, shall, in the matter of taxation and facilities, enjoy the most-favoured-nation treatment.

Articles imported as samples for the purposes above mentioned shall, in each country, be temporarily admitted free of duty on compliance with the Customs regulations and formalities established in order to assure their re-exportation or the payment of the prescribed charges if not re-exported within the period allowed by law. But the foregoing privilege shall not extend to articles which, owing to their quantity or value, cannot be considered as samples, or which, owing to their nature, could not be identified upon re-exportation. The determination of the question of qualification of samples for duty-free admission rests in all cases exclusively with the competent authorities of the place where the importation is effected.

ARTICLE XIV

Marks, stamps, or seals placed upon the samples mentioned in the preceding Article by the Customs authorities of either High Contracting Party at the time of exportation, and any officially attested list of such samples containing a full description thereof issued by them, shall be reciprocally accepted by the Customs officials of the other as

Digitized by Google

establishing their character as samples and exempting them from inspection, except so far as may be necessary to establish that the samples produced are those enumerated in the list. The Customs authorities of either High Contracting Party may, however, affix a supplementary mark to such samples in special cases where they may think this precaution necessary.

ARTICLE XV

Any authorities recognised in the territories of one of the High Contracting Parties as competent for the issue of such identity certificates as may be required for merchants, manufacturers and commercial travellers shall be accepted by the other as competent authorities in that regard.

Each of the High Contracting Parties will inform the other what are the competent authorities for the issue of these certificates as well as of the forms which are required.

ARTICLE XVI

The subjects of each of the High Contracting Parties shall have in the territories of the other the same rights as native subjects in regard to patents for inventions, trade-marks, trade-names, designs and copyright in literary and artistic works, upon fulfilment of the formalities prescribed by the laws and regulations in force in the country.

ARTICLE XVII

Limited-liability and other companies and associations, already or hereafter to be organized in accordance with the laws and regulations of either High Contracting Party, are authorized in the territories of the other, to exercise their rights and appear in the Courts either as plaintiffs or defendants, subject to the laws and regulations of such other Party.

There shall be no conditions or requirements imposed upon companies and associations organized in accordance with the laws and regulations of either High Contracting Party in connection with such access to the Courts of Justice of the other which do not apply to such native companies and associations or those of the most favoured nation.

As regards the acquisition and possession of movable property, as well as the disposition of property rights of every description, companies and associations above mentioned shall, in conformity with the laws and regulations in force in the country, enjoy the same treatment as accorded to native companies and associations. Furthermore as regards the acquisition and possession of immovable property, they shall, on condition of reciprocity, enjoy the most-favoured-nation treatment. It is also understood that, as regards the right to engage in various kinds of commerce and industry, the companies and associations in question shall, subject to the observance of the laws and regulations of public order, enjoy the same rights and privileges as are or may be granted to the like companies and associations of the most favoured nation.

ARTICLE XVIII

Each of the High Contracting Parties shall permit the importation or exportation of all merchandise which may be legally imported or exported, and also the carriage of passengers from or to their respective territories, upon the vessels of the other, and such vessels, their cargoes and passengers shall enjoy the same privileges as, and shall not be subjected to any other or higher duties, charges or restrictions than national vessels and their cargoes and passengers, or the vessels, cargoes and passengers of the most favoured nation.

ARTICLE XIX

In all that concerns the entering, clearing, stationing, loading and unloading of vessels in the ports, basins, docks, road-steads, harbours, or rivers of the two countries, no privilege shall be granted to vessels of a third country which shall not equally be granted to vessels of the other country; the intention of the High Contracting Parties being that in these respects the vessels of each shall receive the treatment accorded to vessels of the most favoured nation.

ARTICLE XX

No duties of tonnage, harbour, pilotage, lighthouse, quarantine or other similar or corresponding duties of whatever nature, or under whatever denomination levied in the name or for the profit of the Government, public functionaries, private individuals, corporations or establishments of any kind shall be imposed in the ports of the

Digitized by Google

territories of either country upon the vessels of the other country, which shall not equally and under the same conditions be imposed in the like cases on the vessels of the most favoured nation. Such equality of treatment shall apply reciprocally to the vessels of the respective countries, from whatever port or place they may arrive, and whatever may be their place of destination.

ARTICLE XXI

Any ship of war or merchant vessel of either of the High Contracting Parties which may be compelled by stress of weather, or by reason of any other distress, to take shelter in a port of the other, shall be at liberty to refit therein, to procure all necessary supplies, and put to sea again, without paying any dues other than such as would be payable by national vessels. In case, however, the master of a merchant vessel should be under the necessity of disposing of a part of his cargo in order to defray the expenses, he shall be bound to conform to the regulations and tariffs of the place to which he may have come.

If any ship of war or merchant vessel of one of the High Contracting Parties should run aground or be wrecked upon the coasts of the other, the local authorities shall give prompt notice of the occurrence to the Consular Officer residing in the district or to the nearest Consular Officer of the other country.

Such stranded or wrecked ship or vessel and all parts thereof, and all furniture and appurtenances belonging thereto, and all goods and merchandise saved therefrom, including those which may have been cast into the sea, or the proceeds thereof, if sold, as well as all papers found on board such stranded or wrecked ship or vessel, shall be given up to the owners or their agents, when claimed by them.

If such owners or agents are not on the spot, the aforesaid property or proceeds from the sale thereof and the papers found on board the vessel shall be delivered to the proper Consular Officer of the High Contracting Party whose vessel is wrecked or stranded, provided that such Consular Officer shall make claim within the period fixed by the laws and regulations of the country in which the wreck or stranding occurred, and such Consular Officers, owners or agents shall pay only the expenses incurred in the preservation of the property, together with the salvage or other expenses which would have been payable in the case of the wreck or stranding of a national vessel.

The goods and merchandise saved from the wreck or stranding shall be exempt from all duties of the Customs unless cleared for consumption, in which case they shall pay ordinary duties.

In the case of a ship or vessel belonging to the subjects of one of the High Contracting Parties being driven in by stress of weather, run aground or wrecked in the territories of the other, the proper Consular Officer of the High Contracting Party to which the vessel belongs, shall, if the owners or their agents are not present, or are present but require it, be authorized to interpose in order to afford the necessary assistance to the subjects of his State.

ARTICLE XXII

The vessels of war of each of the High Contracting Parties may enter, remain and make repairs in those ports and places of the other to which the vessels of war of other nations are accorded access; they shall submit to the same regulations and enjoy the same honours, advantages, privileges and exemptions as are now, or may hereafter be conceded to the vessels of war of any other nation.

ARTICLE XXIII

Vessels charged with performance of regular scheduled postal service of one of the High Contracting Parties shall enjoy in the territorial waters of the other the same special facilities, privileges, and immunities as are granted to like vessels of the most favoured nation.

ARTICLE XXIV

The Consular Officers of each of the High Contracting Parties residing in the territories of the other shall receive from the local authorities such assistance as can by law be given to them for the recovery of deserters from the vessels of the former Party.

It is understood that this stipulation shall not apply to the subjects of the country where the desertion takes place.

ARTICLE XXV

Each of the High Contracting Parties may appoint Consuls-General, Consuls,

Digitized by Google

Vice-Consuls and other Consular Officers or Agents to reside in the towns and ports of the territories of the other where similar officers of other countries are permitted to reside.

Such Consular Officers and Agents, however, shall not enter upon their functions until they shall have been approved and admitted by the Government to which they are sent.

They shall be entitled, on condition of reciprocity, to exercise all the powers and enjoy all the honours, privileges, exemptions and immunities of every kind which are, or may be, accorded to Consular Officers of the most favoured nation.

ARTICLE XXVI

In case of the death of a subject of one of the High Contracting Parties in the territories of the other without having in the country of his decease any known heirs or testamentary executors by him appointed, the competent local authorities shall at once inform the nearest Consular Officer of the nation to which the deceased belonged, in order that necessary information may be immediately forwarded to parties interested.

In case of the death of a subject of one of the High Contracting Parties in the territories of the other, without leaving at the place of his decease any person entitled by the laws and regulations of his country to take charge of and administer the estate, the competent Consular Officer of the State to which the deceased belonged shall upon fulfilment of the necessary formalities, be empowered to take custody of and administer the estate in the manner and under the limitations prescribed by the laws and regulations of the country in which the property of the deceased is situated.

The foregoing provision shall also apply in case of a subject of one of the High Contracting Parties dying outside the territories of the other, but possessing property therein, without leaving any person there entitled to take charge of and administer the estate.

ARTICLE XXVII

The coasting trade of both the High Contracting Parties is excepted from the provisions of the present Treaty, and shall be regulated according to the laws and regulations of Japan and Siam respectively. It is, however, understood that the subjects and vessels of either High Contracting Party shall enjoy in this respect most-favoured-nation treatment in the territories of the other.

Japanese and Siamese vessels may, nevertheless, proceed from one port to another, either for the purpose of landing the whole or part of their passengers or cargoes brought from abroad, or of taking on board the whole or part of their passengers or cargoes for a foreign destination.

It is also understood that, in the event of the coasting trade of either Party being exclusively reserved to national vessels, the vessels of the other Party, if engaged in trade to or from places not within the limits of the coasting trade so reserved, shall not be prohibited from the carriage between two ports of the territories of the former Party of passengers holding through tickets, or merchandise consigned on through bills of lading to or from places not within the above-mentioned limits, and while engaged in such carriage these vessels and their cargoes shall enjoy the full privileges of this Treaty.

ARTICLE XXVIII

The provisions of the present Treaty as regards the most-favoured-nation treatment do not apply to:

(1) Favours, advantages and privileges which are or may be granted by either of the High Contracting Parties to an adjoining State with the object of facilitating frontier traffic within a limited zone on each side of the frontier;

(2) Favours, advantages and privileges granted or to be granted hereafter to a third State in virtue of a Customs Union;

(3) Favours, advantages and privileges contractually granted or to be granted to a third State for the avoidance of double taxation;

(4) Favours, advantages and privileges granted or to be granted hereafter to an adjoining State with regard to the navigation on or use of boundary waterways not navigable from the sea;

(5) The treatment which is or may be accorded to the produce of the national fisheries of the High Contracting Parties or the special tariff favours granted by either of the High Contracting Parties in regard to fish and other aquatic products taken in the foreign waters in the vicinity of that Party.

ARTICLE XXIX

The stipulations of the present Treaty

Digitized by Google

shall be applicable to all the territories and possessions belonging to or administered by the High Contracting Parties.

ARTICLE XXX

The present Treaty shall remain in force for five years from the date on which it comes into effect.

In case neither of the High Contracting Parties shall have notified twelve months before the expiration of the said period the intention of terminating it, it shall remain binding until the expiration of one year from the day on which either of the High Contracting Parties shall have denounced it.

ARTICLE XXXI

The present Treaty shall be ratified, and the ratifications thereof shall be exchanged at Bangkok as soon as possible, and the said Treaty shall come into force on the date of the exchange of ratifications.

IN WITNESS WHEREOF the respective Plenipotentiaries have signed the present Treaty and have hereunto affixed their seals.

Done in duplicate, in the English language, at Bangkok, this eighth day of the twelfth month in the twelfth year of Syōwa, corresponding to the eighth day of the ninth month in the two thousand four hundred and eightieth year of the Buddhist Era, and the eighth day of December in the nineteen hundred and thirty-seventh year of the Christian Era.

FINAL PROTOCOL.

At the moment of proceeding this day to the signature of the Treaty of Friendship, Commerce and Navigation between Japan and Siam, the Plenipotentiaries of the two High Contracting Parties have agreed as follows:

1. The stipulations contained in this Treaty do not in any way affect, supersede or modify any of the laws and regulations with regard to naturalization, immigration and public order, which are in force or which may be enacted in either of the two countries, provided that they do not constitute measures of discrimination particularly directed against the subjects of the other.

2. The terms of the treatment of the most favoured nation in this Treaty are to be interpreted as immediate and unconditional unless otherwise expressly provided.

3. The national fisheries of each of the High Contracting Parties shall be regulated according to the laws and regulations of that Party. It is understood, however, that the subjects of either of the High Contracting Parties in the territories of the other shall enjoy in this respect the same rights and privileges as may be granted to the subjects or citizens of any other country.

4. In all that concerns the provisions of Article 2 of the Treaty, the subjects of either of the High Contracting Parties shall not be treated by the other less favourably than the subjects or citizens of any other country.

5. In the event of any form of quantitative limitation being established for the importation or exportation of articles, each of the High Contracting Parties agrees to grant for the importation from or exportation to the territories of the other Party an equitable apportionment of the quantity of restricted articles which may be authorized for importation or exportation.

6. Articles, the produce or manufacture of the territories of either of the High Contracting Parties, passing in transit through the territories of the other, shall be free from transit duties as provided for in the Convention and Statute on Freedom of Transit concluded at Barcelona, April 20, 1921.

7. The provisions of Article 11 of the Treaty shall not be deemed to prevent either of the High Contracting Parties from charging differing rates in the collection of sale licence fees between imported spirituous liquors and those manufactured by or under licence from the State.

8. It is understood that the provisions prescribing most-favoured-nation treatment in this Treaty do not apply to favours, advantages and privileges in regard to Customs tariffs which may be granted by Japan to articles produced or manufactured in Manchoukuo.

The present Protocol is to be deemed ratified by the ratification of the Treaty of Friendship, Commerce and Navigation signed this day and shall have the same duration as that Treaty.

IN WITNESS WHEREOF the undersigned Plenipotentiaries have hereunto signed their names and affixed their seals.

AGREEMENT ON CULTURAL CO-OPERATION BETWEEN JAPAN AND GERMANY, NOVEMBER 25, 1938

The Imperial Japanese Government and The German Government

Deeply conscious of the fact that the Japanese and German cultures have their true foundations in the intrinsic Japanese spirit on one side and in the German national life on the other, and that the cultural relations of both countries are to be based thereupon, and

Being desirous of strengthening more and more the bonds of friendship and mutual confidence so happily connecting both countries already, by deepening their manifold cultural relations and by promoting the mutual knowledge and understanding of both nations

Have agreed upon the following articles:

Article I The High Contracting States shall strive to put their cultural relations on a firm foundation and shall most closely collaborate with each other in these regards.

Article II In order to attain the aim set forth in the preceding article the High Contracting States shall systematically promote their cultural relations in the domains of science and fine arts, music and literature, film and radio, youth-movements and sports, etc.

Article III The competent authorities of the High Contracting States shall decide by mutual agreement the detailed measures necessary for the execution of the preceding article.

Article IV The present Agreement shall enter into force on the day of its signature. It shall expire twelve months after one of the High Contracting States shall have denounced it.

Statement of the Foreign Office Spokesman on the Same, November 25, 1938

It is a matter for sincere congratulation that the cultural agreement between Japan and Germany, for whose conclusion negotiations have been going on for some time between the representatives of the two countries in Tokyo, has been signed and gone into effect today; the agreement will not only conduce to drawing still closer the cultural relations between the two nations, but be instrumental in enabling them to deepen their knowledge and understanding of each other.

Japan has recently severed all her relations with the League of Nations. This, however, does not mean that Japan has severed her cultural relations with foreign countries or suspended her co-operation with them in the cultural field, but on the contrary she is as ready as ever to co-operate in cultural undertakings with those foreign countries in friendly relationship with her, whether they are member states of the League or not.

The cultural agreement, signed between Japan and Germany today, is a manifestation of the earnest desire of the Japanese Government for strengthening cultural ties with foreign countries through agreements to be concluded separately on a basis of reciprocity. It is the first of the kind to be put into operation, but we hope that it will be followed by similar pacts to be concluded with as many foreign Powers as possible. For instance, a cultural agreement was already signed between Japan and Hungary on November 15 and expected to go into effect in the near future, while preparations are under way for concluding a similar agreement with Italy. It is the policy of the Japanese Government to accelerate conclusion of cultural agreements with those foreign Powers which are desirous of so doing.

The key-note of those agreements which are anticipated to be concluded with foreign Powers lies in an exchange and intermixture of Japanese culture whose essence will be fostered and developed and the essence of characteristic cultures of various foreign countries. The present cultural agreement between Japan and Germany provides for a general policy in cultural co-operation between the two countries under the above-mentioned guiding principle.

Various fields of activities, stipulated

Digitized by Google

by Article II of the present agreement, are only given as examples. Cultural pacts between foreign countries usually have detailed stipulations, but the present agreement between Japan and Germany is rather different in stipulating general provisions for cultural co-operation and leaving room for giving full play to them as occasion demands, while matters of detail shall be discussed and decided on between the competent authorities of the High Contracting Parties in case of necessity.

AGREEMENT ON CULTURAL CO-OPERATION BETWEEN JAPAN AND ITALY, MARCH 23, 1939

The Japanese Government and Italian Government,

Equally animated by a desire to deepen the mutual understanding of both countries and to strengthen more and more the bonds of friendship and mutual confidence so happily connecting them already, by mutually respecting their intrinsic cultures based on their time-honoured traditions and by promoting their manifold cultural relations,

Have agreed upon the following Articles:

Article I The High Contracting States shall strive to put their cultural relations on a firm foundation and shall most closely collaborate in these regards.

Article II In order to attain the aim set forth in the preceding Article, the High Contracting States shall ever promote their cultural relations through the instrumentality of science and art, music and literature, stage and screen, photography and radio, youth-movements and sports, etc.

Article III The competent authorities of the High Contracting States shall decide by mutual agreement the detailed measures necessary for the execution of the stipulations of the preceding Article.

Article IV The present Agreement shall enter into force on the day of its signature. It shall expire twelve months after one of the High Contracting States shall have denounced it.

Statement of the Foreign Office on The Same, March 23, 1939

With a view to consolidating and promoting the cultural relations existing between Japan and Italy in the spheres of arts, literature, science and jurisprudence, the Japanese Government proposed to the Italian Government in December last, the conclusion of an agreement for that purpose. The Italian Government gladly accepted, and as a result the agreement concerning their cultural co-operation has been concluded today. It is a matter for congratulation that this agreement has been put into effect at a time when the friendly relations between Japan and Italy are becoming closer than ever before by virtue of their participation in the anti-Comintern agreement.

The agreement definitely affirms in its preamble that the co-operation between Japan and Italy for the promotion of their cultural intercourse should be based upon the intrinsic features of the ancient and modern cultures of the two countries.

The agreement itself provides the general principles upon which the contracting parties should act, and the competent authorities of both countries are to determine by mutual agreement the following matters among various others which are mentioned in the agreement:

1. Establishment of committees to make suggestions and studies regarding a cultural co-operation to be proposed by one of the contracting parties.
2. Eventual foundation of new cultural institutions which will contribute toward a closer cultural contact between the two countries; maintenance and expansion of such existing institutions.
3. Adaptation of text-books used in schools of both countries within the scope to be later fixed and in conformity with the spirit of the agreement.
4. Facilities for Government students of both contracting parties.
5. Promotion of the exchange of professors and students.
6. Mutual recommendation of those who will be engaged in cultural activities in one of the two countries.
7. Promotion of friendly intercourse between Japanese and Italian youths' organizations.
8. Exchange of books and periodicals.
9. Mutual encouragement of the translation of both general and technical books and other literature which will contribute toward a closer cultural contact between the two countries.
10. Exchanges in the realm of arts.
11. Exchange of films.
12. Exchange of broadcasts.

Digitized by Google

13. Exchanges in the field of sports and public welfare.

14. Exchanges in the field of tourist industry.

THE FISHERY NEGOTIATIONS BETWEEN JAPAN AND THE SOVIET UNION, APRIL 4, 1939

1. The Japanese-Soviet negotiations regarding the question of fishing in the northern waters came to a satisfactory conclusion on April 2 and a modus vivendi was signed at midnight of the same day by Ambassador Togo and Foreign Commissar Litvinoff. The following is an outline of the progress of negotiations conducted after the announcement at the end of February this year up to the time of the conclusion of the agreement.

Since March Ambassador Togo negotiated nine times with Foreign Commissar Litvinoff, namely, on the 8th, 11th, 14th, 22nd, 26th, 28th and 31st of March and 1st and 2nd of April; and in the meantime Counsellor Nishi negotiated from time to time with Assistant Chief of the Far Eastern Bureau Tsarabukin.

Some of these interviews lasted for several hours with heated arguments, and more than once there was the danger of rupture. The Japanese side, however, has consistently endeavoured along reasonable lines to persuade the Soviet to reach an amicable solution while maintaining a resolute attitude for the preservation of our treaty rights. As a result a satisfactory agreement has been reached.

At the interviews held after March 8th, Ambassador Togo refuted the Soviet argument which said it was unreasonable for Japan to demand substitute fishery lots for exempted fishery lots, and he strongly expressed the Japanese contention regarding the stabilized fishery lots. At the same time he endeavoured to persuade the Soviet to postpone the auction scheduled for March 15th, urging the Soviet side to reconsider and stated that the serious responsibility should be borne by the Soviet Government for the situation which might arise as a result of its insistent unilateral contentions.

On March 15th, the Soviet carried out the auction as previously planned and, although the fishery lots which the Japanese had hitherto operated were not affected as a whole, it successfully bid for four of the stabilized lots hitherto operated by the Japanese as well as six fishery lots which the Soviet Government had proposed to place on auction as substitutes for the fishery lots which it has previously proposed to exempt from the operation by Japanese nationals. Against this the Japanese Embassy at Moscow lodged a vigorous protest in an official Note dated the 19th, stating that Japan refused to accept the effect of the auction.

The negotiations were continued which substantially came to a close by the end of March. The negotiations were then shifted to the question of what form of document should be adopted to incorporate the points agreed upon. At midnight on April 2 and the negotiations on the fishery question came to a satisfactory conclusion, and the Japanese participated in the auction held at Vladivostok on April 4.

2. The results of the agreement may be summarized as follows:

(a) The Fishery Convention of 1928 remains in force until the end of this year.

(b) The contract for the special contract fishery lots is extended another year with the exception of four exempted lots, concerning which mention will be made later.

(c) As to stabilized fishery lots they are placed on auction with the exception of the exempted lots, of which mention will be made later, but

(A) The definite prospect is that Japanese fishing interests will acquire them.

(B) These acquired lots will be under lease for five years.

(C) The rent is not to be raised more than ten per cent.

(D) The four lots which were successfully bidden by the Soviet side on March 15th, are to be returned to the Japanese.

(d) The exempted fishery lots:

Thirty-seven fishery lots consisting of thirty-two of the stabilized lots, four of the special lots, and one of the lots under lease are exempted from auction as exceptions to Article 8 of the Protocol A of the Fishery Convention. But against these lots ten substitute lots are offered, nine of which are to be leased for five years by auction.

(e) The nine Japanese fishery lots, which have been placed on auction because their lease expired, will be successfully bidden by the Japanese for the term of five years.

Digitized by Google

(f) The fifty-two fishery lots which have been still under lease will continue to be leased by the Japanese.

(g) The rate of rouble exchange remains the same as before.

To sum up, the Japanese side has acceded to the Soviet contention regarding the placing of the so-called stabilized lots on auction because the term of their lease has expired. But the Japanese will successfully bid for all the fishery lots except the exempted ones and secure the stabilization of the fishery lots for five years. As for the exempted fishery lots, although we are not to operate twenty-seven of them, we can operate about three hundred and sixty fishery lots. In other words, Japan has acquired as the result of the recent negotiations about three hundred and sixty fishery lots in all, of which two hundred and sixty-four are to be stabilized for five years.

CUSTOMS TARIFF LAW

ARTICLE I Customs duties shall be levied upon articles imported from foreign countries in accordance with the annexed Tariff.

ARTICLE II Duties upon articles charged with ad valorem duty shall be levied on the value on arrival at the time of importation.

ARTICLE III With regard to articles, the produce or manufacture of territories not enjoying the benefit of a conventional arrangement, a benefit not exceeding the limits stipulated in such arrangement may, if necessary, be extended to such articles by means of Imperial Ordinance, specifying the territory and articles concerned.

ARTICLE IV With regard to the produce or manufactures or exports of, or articles passing through a country where Japanese vessels, produce or maunfactures, or articles passing through Japanese territory are subject to a less favourable treatment than the vessels, produce or manufactures of, or articles passing through other countries, such articles may be designated by Imperial Ordinance so that special duties, not exceeding in amount their value, may be imposed upon them, in addition to the duties enumerated in the annexed Tariff.

ARTICLE V With regard to articles benefitting from export bounties in foreign countries, duties corresponding in amount to such bounties may be levied on them by Imperial Ordinance, in addition to the duties enumerated in the annexed Tariff.

ARTICLE V-2 When any important industry in this country is in danger of being injuriously affected by the importation of articles for the purpose of dumping or by the dumping of imported articles, such articles may be designated in accordance with the provisions of Imperial Ordinance after investigation by the Dumping Investigation Committee, and on such articles may be imposed during a specified period of time duties not exceeding in amount their proper value, in addition to the duties enumerated in the annexed Tariff.

In case the articles designated according to the provisions of the foregoing paragraph have already been imported and are owned by or in the possession of a dumper or his agent, the additional duty mentioned in the said paragraph may be collected from such dumper or agent.

The additional duty stipulated in the preceding paragraph shall be collected in the same way as a national tax.

ARTICLE VI The import duty on rice, hulled or unhulled, may in case of a famine be reduced by Imperial Ordinance for a specified period to a rate not lower than forty sen per hundred kin.

ARTICLE VII The following articles shall be exempt from import duties:—

1 Articles for the use of the Imperial Household.
2 Articles belonging to a foreign ruler and his family and suite, visiting Japan.
3 Arms, ammunition, and explosives imported by the Army or the Navy.
4 Mineral oils for fuel imported by the Government.
5 Warships.
6 Articles for the personal use of foreign Ambassadors and Ministers and other envoys of similar standing accredited to Japan, and articles for the official use of foreign Embassies and Legations in Japan, with the exception of those belonging to countries which enforce restrictions upon the free entry of articles for the personal use of the Japanese Ambassador, Minister or such other envoy, or of articles for the official use of the Japanese Embassy or Legation. In the case of such countries a reciprocal arrangement shall be applied.
7 Articles for the personal use of the staff of the Embassies or Legations in

Digitized by Google

Japan of countries where similar courtesy is extended to the staff of the Japanese Embassy or Legation, and articles for the official use of the Consulates in Japan of countries where similar courtesy is extended to the Japanese Consulates.

8 Decorations, medals and badges presented to persons resident in this country.

9 Records and other documents.

10 Articles that are imported for use as specimens or objects of reference in the schools, museums, commercial museums and other institutions maintained by the Government or a municipality, or in private schools designated by Ordinance, and for the importation of which permission of the Minister of Finance has been obtained.

11 Supplies contributed for the purpose of charity or relief, or articles contributed to orphan asylums, asylums for the old, charity hospitals and such other charity institutions and which are used for the direct purpose of charity.

11-b Articles of use for ceremony or worship contributed to a shrine, temple, church or chapel.

12 Articles of Government monopoly or materials to be used for manufacturing alcohol imported by the Government.

13 Samples of merchandise only fit for use as such.

14 Personal effects of travellers, and their professional tools and implements, which the Customs authorities consider proper in view of the personal status of such travellers.

15 Articles sent home by the Imperial military forces, warships, or official missions abroad.

16 Personal effects and household articles in transportation on account of the change of residence, provided such effects and articles have already been used.

17 Exported articles which are reimported within five years unaltered in character and form from what they were at the time of exportation, excepting alcohol, alcoholic liquors, sugar, and those articles which had been exempted from import duty or granted a rebate under the provisions of Article VIII or Article IX.

18 Receptacles specified by Ordinance for containing exports and which are reimported, excepting such as had been exempted from import duty under the provisions of Article VIII.

19 Fish, shell-fish, mollusca, sea animals, sea weeds and other aquatic products caught or gathered by vessels which set out from Japan, and manufactures thereof of a simple process, provided they are imported by such vessels or vessels attached thereto.

20 Articles for ship's use delivered to warships and mercantile vessels bound for foreign countries, except those mentioned in Article X.

21 Wreckage and fittings of shipwrecked Japanese vessels.

22 Articles exported on vessels clearing from Japan but which are brought back owing to the wreckage of such vessels, except those articles which had been exempted from import duty or granted a rebate under the provisions of Article VIII or Article IX.

23 Animals for breeding and protective serum or vaccine against animal plague, imported by the State, Do, Fu, Ken or other public bodies, by industrial juridical persons designated by the Government, or by persons under permission of the Government.

24 Aircrafts, or motors or propellers for aircrafts imported with Government permission in accordance with the provisions of Ordinance.

ARTICLE VIII The following articles are exempted from import duty in case they are to be re-exported within one year from the date of their importation, but the deposit of security corresponding to the amount of duty may be required at the time of importation:—

1 Articles designated by Ordinance and which are imported to have work done upon them.

2 Receptacles of imported articles, designated by Ordinance.

2-b Articles to be used as receptacles of export goods and designated by Ordinance.

3 Articles imported for repair.

4 Articles imported for the purpose of scientific research.

5 Articles imported for trial.

6 Samples imported for the purpose of procuring orders.

6-b Articles imported as samples of workmanship.

7 Articles for use in public performances imported by travelling public entertainers visiting Japan.

8 Articles imported for exhibiting at an exposition competition or prize

Digitized by Google

show, etc.

ARTICLE IX Import duties on materials to be used for manufacturing export articles designated by Ordinance, may be exempted or refunded, wholly or partly, according to the provisions of the Ordinance.

Import duties on materials to be used for manufacturing hatter's fur, cellulose pulp, precious stones formed for mechanical or industrial purposes, lead foil for packing tea, zinc sheet not exceeding 0.17 millimetre, or oil or oil-cake designated by Ordinance may be exempted or refunded wholly or partly, according to the provisions of Ordinance.

In case import duties are exempted according to the provisions of the foregoing two paragraphs, the deposit of security corresponding to the amount of duties may be required at the time of importation.

Any person who obtains or attempts to obtain by fraud or other illegal means the refundment mentioned in the first or second paragraph of this Article, shall be dealt with according to the provisions of Article LXXV of Customs Law.

ARTICLE X Iron or steel materials, equipments, parts of equipments, engines or parts of engines, which are to be used for shipbuilding or repair, and which are designated by Ordinance, may be exempted from import duties according to the provisions of Ordinance.

ARTICLE XI The importation of the articles mentioned below is prohibited:—

1 Opium and utensils for smoking opium, excepting those imported by the Government.
2 Counterfeit, altered or imitation coins, paper money, bank-notes and negotiable papers.
3 Books, pictures, carvings and other articles, liable to injure public security or morals.
4 Articles wich infringe rights in patents, utility-models, designs and trademarks, and copyrights.

Supplementary provision to Law No. 56 of 1939.

The date on which this Law shall come into force shall be determined for each respective regulation by Imperial Ordinance. (By Imperial Ordinance No. 456 of 1939, this Law came into force on July 10th, 1939.)

IMPORT TARIFF OF THE PRINCIPAL COMMODITIES[1]

Where the duty number is marked *, it means that the articles in question are subject to the provisions of the Luxury Tariff Law.

The extra column for "Specific Duty etc.," is due to the fact that on June, 16, 1932, a law was passed providing that, with certain exceptions, "Specific duties . . . . . shall for the time being be assessed at the rate of 135 per cent."; the law was amended in 1933, 1935, 1936 and 1937. The figures in this extra column are calculated on this basis.

THE PICTORIAL ORIENT

Formerly "Japan in Pictures"

• ASAHIGRAPH OVERSEAS EDITION •

HERE ARE PICTORIALS AND BOOKS
INTERPRETING THINGS JAPANESE

A Pictorial Monthly, interpreting Japan and things Japanese to the Western World in order to promote international understanding and friendship. Each edition of "Pictorial Orient" contains an extensive collection of pictures, done in rotogravure, with explanatory notes in English and French.

Printed and published on the 5th of each month, Subscription rates; 60 sen per copy. Subscription for 12 months ¥ 6.74 in Japan, ¥ 8.42 abroad, postage prepaid.

Publishers

ASAHI SHIMBUN-SHA

Tokyo & Osaka, Japan

Digitized by Google

A National Newspaper For International Readers

The Osaka Mainichi
& The Tokyo Nichi Nichi

Published in English Daily, Except Mondays

History is today being made with lightning tempo.

In addition to speed, the Osaka Mainichi and Tokyo Nichi Nichi offer to their English Edition readers the following:

JAPAN: An insight into what the Japanese are thinking. A day-to-day record, with many photographs, of what the Japanese are doing.

EAST ASIA: Full coverage of the news from the front and of the momentous events occurring in East Asia.

EUROPE & AMERICA: Reports from own correspondents in the key cities to cover the rapidly moving events. Greater linage of foreign news than in the Japanese-language newspapers.

THE JAPAN ADVERTISER

Foremost English-Language Newspaper in Japan

Read not only by the foreign residents of the country but by the more prominent Japanese in finance, business and politics. The Japan Advertiser, because it is independent and unbiased, is the outstanding interpreter of the East to the West and of the West to the East.

The Trans-Pacific

A Weekly Review of Far Eastern Political Social and Economic Developments
Published by
The Japan Advertiser

Only English-Language Export Magazine in Japan

This weekly edition of The Japan Advertiser contains a digest of the most important news events in every field. In recent years it has been growing in importance as an organ for Japanese exporters, for it circulates into every corner of the globe. If you are interested in Japanese export lines or if you merely wish to keep abreast of events in Asia, The Trans-Pacific is indispensable.

Foreing Subscription Rates are ¥ 73 a year for The Japan Advertiser and ¥ 21 a year for The Trans-Pacific. Inquiries and subecriptions may be addressed to P.O. Box F-58, Tokyo.

If you are planning an advertising campaign in Japan,
THE TRANS-PACIFIC ADVERTISING & SERVICE BUREAU
will handle all details with the efficiency born of 25 years experience.

THE JAPAN TIMES & MAIL

Mirrors The Far East . . .

THE JAPAN TIMES & MAIL, the oldest daily newspaper in this country, is the only journal in the English Language to be published in Tokyo under the management and editorial supervision of Japanese.

As a mirror of Japanese opinion and as a chronicler of major events occurring in Japan, Manchoukuo and China it is without a peer.

It is also an authoritative source of information on the economic and financial progress of the Far East.

Nagoya City

The 3rd Largest City in Japan

The Industrial Metropolis of Mid-Japan

Very conveniently located on the tourist channel of Japan, Nagoya (366 km. from Tokyo and 190.4 km. from Osaka; pop. 1,300,000) has a wide range of attractions, industrial, scenic and historical.

In industrial and commercial activities, no other city in central Japan could possibly challenge Nagoya, which besides enjoying ample transportation facilities by land, sea and air, is blessed with a mild climate and numerous advantages favourable to the development of various lines of commerce and industry.

For information please apply to the City Office or the Municipal Trade Promotion Bureau, Teppo-cho, Naka-ku, Nagoya.
